FORMAL HEARING

Volume I

This matter came on for Formal Hearing  
before the Honorable Presiding Officer Constance  
C. Owen for the Division of Water Resources of  
the State of Kansas, at Halstead, Kansas, before  
Rachelle Smith, a Certified Shorthand Reporter  
of Kansas, December 10, 2019, at 9:02 a.m.

A P P E A R A N C E S

The City of Wichita Department of Public Works & Utilities appeared by its attorney, Mr. Brian K. McLeod, Attorney at Law, 455 North Main Street, Wichita, Kansas, 67202.

The Division of Water Resources Kansas Department of Agriculture appeared by its attorney, Mr. Aaron Oleen, Attorney at Law, 1320 Research Park Drive, Manhattan, Kansas 66502.

The Equus Beds Groundwater Management District Number 2 appeared by its attorneys, Mr. David J. Stucky and Mr. Thomas A. Adrian, Attorneys at Law, 313 Spruce, Halstead, Kansas 67056.

The Intervenors appeared by their attorney, Ms. Tessa M. Wendling, Attorney at Law, 1010 Chestnut Street, Halstead, Kansas 67056.

P R O C E E D I N G S

THE HEARING OFFICER: Thank you, everyone, for being here. We'll now go on the record and our court reporter will begin recording what takes place here today.

Can everyone hear me? Well, I shouldn't ask because if you can't hear me you wouldn't know.

This case is entitled: In the matter of the City of Wichita's Phase II Aquifer Storage and Recovery Project in Harvey and Sedgwick Counties, Kansas. It is Case Number 18 WATER 14014. Today's date is December 10, 2019. The time is 9:05 a.m. My name is Constance C. Owen, and I will be serving as presiding officer over these next few days.

The formal parties in this proceeding are the City of Wichita, Kansas Department of Agricultural Division of Water Resources, the Equus Beds Groundwater Management District Number 2 and the following individuals who will be collectively referred to as the intervenors. They are Richard Basor, Josh Carmichael, Judy Carmichael, Bill Carp, Carol Denno, Steve Jacob,

1 Terry Jacob, Michael J. McGinn, Bradley Ott,  
2 Tracy Pribbenow and David Wendling.

3 Notice of this hearing was provided  
4 according to K.A.R. 5-14-3a by a notice issued  
5 directly to the parties and notice to the public  
6 by publication, direct mail and posting on the  
7 DWR website.

8 Regarding public comment, thank you to  
9 members of the public who are here today, you  
10 are welcome here. Public comments are welcome  
11 either in writing or orally. As explained in  
12 the notice of hearing written comments may be  
13 submitted any of the following ways. One, by  
14 giving them to DWR staff during the formal phase  
15 of this hearing today, tomorrow or Thursday.  
16 And, DWR, would you please raise your hand so  
17 they know?

18 Number two, written comments can be  
19 given to DWR staff on Friday during the time  
20 reserved for oral public comment. You can mail  
21 written comments to DWR or E-mail them to DWR,  
22 Division of Water Resources, and as instructed  
23 on their website. The deadline for submitting  
24 written comments will be midnight on January 17,  
25 2020, at which time the record for this hearing

1 will be closed. Written public comment  
2 submitted before today are already a part of the  
3 record and need not be resubmitted. I will read  
4 and carefully consider all written public  
5 comments, whether submitted earlier than today  
6 or at some time before midnight on January 17.

7 For oral public comments a separate  
8 time has been set aside for that, for this week.  
9 Anyone wishing to give oral comments may do so  
10 this Friday morning, December 13, between 9:00  
11 a.m. and 11:00 a.m. That will be in this same  
12 location. As with written public comment I will  
13 carefully consider all oral public comments in  
14 reaching my decision in this case.

15 A display screen has been set up so  
16 that members of the public here today can see  
17 the exhibit while the attorneys are questioning  
18 witnesses. The order of presentation will be in  
19 this sequence. The City of Wichita, DWR,  
20 Groundwater Management District and the  
21 Intervenors.

22 May we have appearances from counsel,  
23 please.

24 MR. McLEOD: Brian McLeod for the City  
25 of Wichita.

1 MR. OLEEN: Aaron Oleen, attorney for  
2 the Division of Water Resources.

3 MR. ADRIAN: Tom Adrian attorney for  
4 Equus Beds Groundwater Management District  
5 Number 2.

6 MS. WENDLING: Tessa Wendling for the  
7 Intervenors.

8 THE HEARING OFFICER: Thank you.  
9 Regarding prehearing motions, a number of  
10 prehearing motions were submitted as were  
11 responses to them and those motions have all  
12 been resolved with one exception. Groundwater  
13 Management District 2, Motion to Dismiss filed  
14 March 11, 2019, and the other parties' responses  
15 to it are still under advisement.

16 The purpose of this hearing is to take  
17 information relative to the City of Wichita's  
18 proposal to modify their water rights under the  
19 Aquifer Storage and Recovery Project Phase II.  
20 As documented in previous orders in this case  
21 this hearing shall specifically consider the  
22 following two issues. One, should the bottom of  
23 the storage basin area be lowered as proposed by  
24 the City. And, two, should the changes in the  
25 conditions in the City's ASR Phase II water

1 permits be approved to allow the use of aquifer  
2 maintenance credits, or AMCs, as the City has  
3 described and proposed.

4 As previously ordered, the City bears  
5 the burden of proving by the preponderance of  
6 the evidence that the proposed changes to the  
7 project meet regulatory and statutory  
8 requirements. This includes the burden to prove  
9 that the proposed changes will neither impair  
10 use under existing water rights nor  
11 prejudicially and unreasonably affect the  
12 public's interest.

13 As documented in our recent prehearing  
14 order on final status conference I am taking  
15 administrative notice of the following: The  
16 Kansas Water Appropriations Act and other Kansas  
17 Statutes, regulations promulgated by the chief  
18 engineer and orders issued by, or on behalf of  
19 the chief engineer, specifically the approved  
20 water appropriation permits for the Wichita ASR  
21 Phase I and Phase II projects, including  
22 official written explanations, transmission  
23 documents and finding some orders related to  
24 those permits.

25 Are there any questions or preliminary

1 items the parties wish to raise at this time  
2 before we start?

3 Okay. Seeing none, then we can get  
4 started. We'll begin with the City of Wichita,  
5 and, Brian McLeod, you may proceed.

6 MR. McLEOD: Thank you. And the City  
7 will first call Mr. John Winchester to the  
8 stand.

9 JOHN WINCHESTER,  
10 was thereupon called as a witness herein, and  
11 after having first been duly sworn to testify to  
12 the truth, the whole truth and nothing but the  
13 truth, was examined and testified as follows:

14 MR. McLEOD: Preliminarily to get the  
15 proposal of record, I will offer, as I will have  
16 the Reporter mark it as Exhibit 1.

17 (City Exhibit 1 was marked for  
18 identification by the Reporter.)

19 MR. McLEOD: The proposal and  
20 attachments which will serve to show what the  
21 City's proposal was, and as issues have been  
22 raised whether it was sufficiently and  
23 reasonably supported for the hearing officer to  
24 hold the hearing on it. We'll also show how  
25 that proposal, when submitted, was supported.

1 I offer it for admission, if there are  
2 no objections.

3 THE HEARING OFFICER: Any objections?  
4 Hearing none, Exhibit 1 will be admitted.

5

6 DIRECT EXAMINATION

7 BY MR. MCLEOD:

8 Q. Please state your name for the record.

9 A. My name is John Winchester.

10 Q. Mr. Winchester, what is your occupation?

11 A. I am a water resources engineer specializing in  
12 water rights, planning and management, primarily  
13 for municipalities.

14 Q. And in terms of your education, what's the  
15 extent of your post secondary education?

16 A. I have a bachelors degree in watershed science  
17 and a master's degree in civil engineering, both  
18 from Colorado State University.

19 Q. Do you hold any professional licenses or  
20 registrations?

21 A. Yes.

22 Q. And what are those?

23 A. I am registered in four states Kansas, Colorado,  
24 New Mexico as a professional engineer and  
25 actively registered in Oklahoma.

1 Q. Where are you employed?

2 A. I am self-employed. I work for High Country  
3 Hydrology located west of Colorado, Boulder,  
4 Colorado.

5 Q. How long has that been the case?

6 A. I have been in business since 2008.

7 Q. What is your title there at High Country  
8 Hydrology?

9 A. I am the president.

10 Q. How about your previous employment immediately  
11 before High Country?

12 A. I worked for a firm called Hydrosphere Resource  
13 Consultants, which was located in Boulder. It  
14 is also a water rights planning firm. I was  
15 there from 1996 through 2008.

16 Q. And what was your title there?

17 A. I was a project manager.

18 Q. And did it involve similar work to what you do  
19 for High Country?

20 A. Yes.

21 Q. Have you been accepted as an expert witness in  
22 other trials or hearings?

23 A. Yes.

24 Q. And can you give us an example of what kinds of  
25 trials and hearings.

1 A. Yes. Most recently was as the applicants'  
2 engineer for a new water right on the south  
3 Platte River. We were looking to change  
4 existing agricultural rights to municipal use.  
5 Before that it was for a, as an engineer, for a  
6 defendant, the State of Colorado versus this  
7 farmer down on what there is known as the  
8 Arkansas River near John Martin there in  
9 Colorado.

10 Q. Was the State of Colorado attempting to do their  
11 state version of administering his rights in  
12 some respect?

13 A. Yes. There was a dispute about whether or not  
14 there was a futile call on a tributary.

15 Q. In the course of your water resources modeling  
16 work what are some of the models of which you  
17 have experience?

18 A. So we have used a wide variety everything from  
19 Excel spreadsheets to MODSIM, which was created  
20 at Colorado State University. Some of its  
21 sister models, ExcelCRAM, RESNET, RiverWare,  
22 which was developed by the Texas, I am sorry,  
23 the Tennessee River Valley Authority for  
24 hydropower, models for EPA network systems which  
25 are distribution system models.

1 Q. In the lime colored notebook on the table behind  
2 the tab for expert witnesses, can you locate  
3 your curriculum vitae, or if you prefer, resume.

4 A. (Witness reviews documents).

5 MR. McLEOD: Found it. Let's mark this  
6 as Exhibit 2.

7 (City Exhibit 2 was marked for  
8 identification by the Reporter.)

9 Q. Mr. Winchester, can you identify that document  
10 for us?

11 A. Yes. It's my resume.

12 Q. And was this a document that you created?

13 A. Yes.

14 Q. And approximately when it was it prepared?

15 A. August of 2018.

16 Q. At the time it was prepared, were its contents  
17 an accurate reflection of your professional  
18 experience as of that date?

19 A. Yes.

20 MR. McLEOD: I formally offer Exhibit  
21 2, if there are no objections.

22 THE HEARING OFFICER: Any objections?

23 MR. ADRIAN: No objections.

24 BY MR. McLEOD:

25 Q. At the time the document was generated, Mr.

1 Winchester, it looks like some the work that is  
2 referred to, including some of the modeling in  
3 drought analysis for the City of Wichita were  
4 discussed as works in progress. Have those  
5 since been completed?

6 A. Some of them, yes.

7 Q. And which ones?

8 A. The system modeling that we have done, I believe  
9 has been finished to determine the return  
10 intervals for the drought plan of record.

11 Q. Have you been involved in any other recent  
12 projects that are not included in the resume?

13 A. Nothing substantial, no.

14 Q. Turning to the topic of drought reconstruction,  
15 what in general is drought reconstruction and  
16 what is the point of doing such an analysis?

17 A. When engineers look at designing projects, we  
18 like to have a target for how robust something  
19 should be. So, for example, typically county  
20 regulations when you look at culvert design,  
21 county regulations will want to have a culvert  
22 size for a ten year flood, state highways are  
23 typically designed for hundred year flood,  
24 federal landscapes are typically designed for  
25 250 year flood. In drought planning

1 municipalities we try to make sure there is a  
2 reasonable level of certainty where we can  
3 provide reliable water supply for the uses that  
4 the city deems most important.

5 And so the work I do is primarily  
6 looking at a combination of water rights and  
7 physical hydrology to determine the water supply  
8 available to municipalities.

9 Q. In Exhibit 1, specifically its Attachment B, and  
10 you can find a copy of it actually in the black  
11 binder in behind the tab proposal.

12 THE HEARING OFFICER: Should I have a  
13 copy of the exhibit book?

14 MR. McLEOD: You should. Can we loan  
15 her DWR's?

16 MR. OLEEN: Can we go off the record?

17 THE HEARING OFFICER: Let's go off the  
18 record.

19 (A short off-the-record discussion  
20 was held at this time.)

21 THE HEARING OFFICER: We are back on  
22 the record now after a short break.

23 BY MR. McLEOD:

24 Q. Mr. Winchester, within Exhibit 1 the proposal  
25 which has been admitted, please turn to the

1 Attachment B and what is that document there as  
2 Attachment B?

3 A. (Witness reviews documents). These attachments  
4 haven't been labeled, but are you referring to  
5 research paper number 45?

6 Q. Yes.

7 A. By Wayne Palmer?

8 Q. Yes. Thank you. And is that a government  
9 document published at the direction of a Bureau  
10 of the United States Government?

11 A. Yes, it is.

12 Q. Is the essential point of that research paper to  
13 outline a methodology to create an index for the  
14 quantitative assessment of droughts so that  
15 droughts from different times and different  
16 places can be compared?

17 A. Yes.

18 Q. What is that index called?

19 A. Research paper number, I am sorry, the index  
20 itself is the Palmer Drought Severity Index,  
21 PDSI.

22 Q. Named after Mr. Palmer who wrote the paper?

23 A. Yes.

24 Q. Is this research paper a reliable authority on  
25 the use of the Palmer Drought Severity Index

1 mechanism to quantify and compare droughts?

2 A. Yes, it's the original document that outlined  
3 the procedure for calculating PDSI.

4 Q. What are some of the government agencies that  
5 use the Palmer Drought Severity Index to  
6 prophesy and record drought conditions?

7 A. The most prominent one would be NOAA. They  
8 publish a drought severity index once a week and  
9 it is published on websites so that water  
10 research managers can see where we are as far as  
11 how wet it is currently in different areas.

12 Q. What do the letters in NOAA stand for?

13 A. National Oceanic Atmospheric Administration.

14 Q. Do you know if it's also used by the U.S.  
15 Department of Agriculture?

16 A. Yes, it is.

17 Q. The United States drought monitor as well?

18 A. Yes, it is.

19 Q. Turning passed the table of contents for that  
20 paper to the first numbered page of the paper,  
21 and particularly the beginning of the second  
22 paragraph in the abstract, it notes the  
23 underlying concept of the paper is the amount of  
24 precipitation required for minimal operation of  
25 the established economy of an area during some

1           stated period is dependent on the average  
2           climate of the area and on the prevailing  
3           meteorological predictors both during and  
4           proceeding the month and period in question.

5                           Is all of that basically recognizing  
6           that the index value that gets assigned to a  
7           period will be influenced by the soil moisture  
8           resulting from the conditions of the preceding  
9           period and then factors such as temperature,  
10          precipitation and evapotranspiration during the  
11          period?

12    A.    Yes.

13    Q.    In the next paragraph, it mentions successive  
14          monthly index values for past dry periods were  
15          combined by a relatively objective procedure to  
16          yield an equation for calculating drought  
17          severity on four classes mild, moderate, severe  
18          and extreme. What are the numerical index  
19          values that would apply to each class of  
20          drought?

21    A.    For drought, zero level would be considered a  
22          normal period. Negative one, the rates go from  
23          negative one to negative four, with negative one  
24          being the most mild and negative four being the  
25          most extreme.

1 Q. And some people use larger integers than four.  
2 Some are positive six to negative six, but it is  
3 the same relationship where they are doing that,  
4 negative is the most severe, positive is the  
5 wettest period?

6 A. Yes.

7 Q. Do you know why there is that range, that some  
8 people use a four and four and others use a six  
9 and six?

10 A. I believe that it was originally aimed at plus  
11 and minus four or five and as we have gone back  
12 in time and looked at Paleo records we found  
13 events that were more extreme and they had to  
14 extend it.

15 Q. And in Mr. Palmer's original version it was four  
16 and four for the parameters?

17 A. Yes.

18 Q. Looking back to the page we were on in the first  
19 paragraph of the introduction, there is an  
20 observation that the term drought may mean  
21 different things to different people. Does it  
22 follow from that that the first step in deriving  
23 a tool were for a place to place, a period  
24 comparison would be to come up with the specific  
25 and consistent definition of drought?

1 A. Yes.

2 Q. And turning to the next page in the right-hand  
3 column we see the author has identified a common  
4 element among meanings which he sees as people  
5 use the term drought for a moisture shortage  
6 that seriously affected the economy of their  
7 region. And he has, therefore, adopted the  
8 American Meteorological Society's definition of  
9 drought as a prolonged and abnormal moisture  
10 deficiency; is that correct?

11 A. Yes.

12 Q. So for purposes of the Palmer Drought Severity  
13 Index that is the meaning of drought?

14 A. Yes.

15 Q. Turning back in the exhibit to the page that is  
16 numbered Page 34, at the Palmer meteorologic  
17 drought paper, we can see western Kansas was  
18 actually one of the indexed areas for his study  
19 for the years 1887 to 1957 and 1958 to '62. Is  
20 that correct?

21 A. Yes.

22 Q. So this is some Kansas specific data that Mr.  
23 Palmer was working from when he first put the  
24 concept of this index together?

25 A. Yes.

1 Q. In the discussion on that page we see mention of  
2 two single year droughts in 1894 and 1913 as to  
3 which he quotes some contemporaneous written  
4 narratives that suggest each was a drought of  
5 disastrous severity; is that correct?

6 A. Yes.

7 Q. And does his discussion there serve to  
8 illustrate how the application of the index may  
9 show that the spike similar subjective  
10 characterizations of the 1894 and 1913 droughts  
11 by people who were in them, when you apply the  
12 index you see the droughts weren't really  
13 similar at all; is that correct?

14 A. Correct.

15 Q. And that would be one of the values of using the  
16 index for comparison, right, that it can pull  
17 out and reveal facts like that?

18 A. Yes.

19 Q. Beginning on that same page, does the PDSI  
20 description of the 1930s drought as a multiyear  
21 drought with 38 months of extreme drought in the  
22 98 month period of August 32 to October of 1940  
23 serve to objectively demonstrate that it also  
24 was not similar to either the 1894 or the 1913  
25 droughts?

1 A. Yes.

2 Q. Compared to 1894, where there was extreme  
3 drought indexed values in July to December, or  
4 50 percent of the period of that year, the 1930s  
5 drought has extreme drought conditions in less  
6 than 40 percent of the indexed period, but  
7 Palmer's discussion on number Page 37 of the  
8 paper reflects that impacts of the 1930s drought  
9 included major dust storms and compared  
10 vegetative cover even on ungrazed prairies from  
11 1932 to '41. What does that tell us?

12 A. That tells us that short-term droughts, for  
13 example, from 1894 and 1913 will have different  
14 affects on both livelihoods and the broader  
15 ecosystem than the extended drought. The  
16 drought in 1930s was longer, or at least some of  
17 the vegetation died and the wind was able to  
18 start mobilizing the sand underneath causing  
19 dust storms.

20 Q. So even though there may have been even more  
21 severe years in the shorter droughts, the  
22 duration of the 1930s drought contributed to an  
23 overall greater impact?

24 A. Yes, that's correct. For dust storms.

25 Q. And because of that, can we conclude that the

1 duration, determinate duration of a model  
2 drought, is as important as identifying the  
3 index severity?

4 A. Yes, it is.

5 Q. If we were simply to assign PDSI values only to  
6 years for which modern meteorological records  
7 exist for south central Kansas how far back  
8 could we go?

9 A. So the meteorological records temperatures and  
10 precipitation go back to late 1880s. Stream  
11 flow is much more recent, 1920s.

12 Q. So a little over a century for temperature and  
13 precipitation, but for stream flow less than a  
14 century?

15 A. Yes.

16 Q. So with that limited data, if we were stuck with  
17 only that, we would be able to tell if there had  
18 been a drought with the duration and severity of  
19 the dustbowl drought in the last century; and,  
20 in fact, there was the dustbowl drought, but  
21 that --

22 MR. STUCKY: I will go ahead and object  
23 as to the leading nature of these questions and  
24 the fact that we are reading the report and  
25 leading the witness along in that regard. So my

1 objection is as to leading.

2 MR. McLEOD: We are in an  
3 administrative hearing, and with a very short  
4 timeframe, I don't think that the leading  
5 nature, which I acknowledge, of some of the  
6 questions is harmful. In fact, it will help us  
7 get through the material faster. Almost all of  
8 Mr. Winchester's material really is background,  
9 it is important background to understand because  
10 drought is the motivation for everything that we  
11 are talking about today. That really will not  
12 be the central substantive issue of the case.  
13 So I think under the circumstances leading  
14 questions ought to be all right.

15 THE HEARING OFFICER: I am going to  
16 overrule your motion. Please proceed.

17 BY MR. McLEOD:

18 Q. So if we were stuck with that data, less than a  
19 century of data, what does that do to our  
20 ability to model a hundred year drought?

21 A. It means that we don't have a solid knowledge of  
22 what, for example, 1% drought, a hundred year  
23 drought would be. We don't know if like the  
24 1930s was more severe or less severe because  
25 it's a period less than hundred years.

1 Q. So the period of the data imposes that  
2 limitation if we use only meteorological  
3 instrumental data?

4 A. Yes.

5 Q. As additional PDSI data is compiled to enable  
6 comparison of droughts over longer periods of  
7 time, how does that support the use of PDSI data  
8 as a predictive tool?

9 A. As the PDSI data has been extended backwards  
10 through tree rings, and other things, we have  
11 been able to get a longer period of record for  
12 the drought wet cycles. And based on that, we  
13 can be more sure that the drought severity we  
14 are looking at is representative of the design  
15 criteria.

16 Q. What are some of the things that people use for  
17 that purpose other than tree ring data?

18 A. There is quite a bit. Some of it is more  
19 generally accepted than others. Certainly tree  
20 rings are where they start, there could be lake  
21 deposits, sediment deposits, wind blown  
22 deposits. There is just a variety of things. I  
23 am not an expert in that area.

24 Q. Are there scientifically recognized means to  
25 generate PDSI values for periods in prior

1 centuries before meteorological record systems  
2 were in place in order to enhance the usefulness  
3 of the PDSI and PDSI demonstrative patterns as a  
4 predictive tool?

5 A. Yes.

6 Q. And the tree rings you mentioned would they be  
7 an example of that?

8 A. Yes.

9 Q. Is the term Paleoclimatology data one of the  
10 terms that's used to determine data from such  
11 sources?

12 A. Yes.

13 Q. Have there been published studies by researchers  
14 that constructed PDSI data sets spanning prior  
15 centuries based on tree ring data?

16 A. Yes, there have.

17 Q. In the white binder, behind the tab drought  
18 reconstruction. Which you see the yellow tab  
19 you kind of have to look through the text that  
20 corresponds to that tab.

21 A. (Witness reviews documents).

22 MR. McLEOD: There is a document which  
23 I am handing to the reporter to mark as Exhibit  
24 3.

25 (City Exhibit 3 was marked for

1 identification by the Reporter.)

2 BY MR. McLEOD:

3 Q. Mr. Winchester, what is this document?

4 A. You are looking at the Drought Reconstruction  
5 for the Continental United States by Edward  
6 Cook?

7 Q. Yes.

8 A. It was written in 1999, it was an article  
9 written for the American Meteorological Society.

10 Q. And what was the publication in which they  
11 published it?

12 A. American Meteorological Society, a journal, peer  
13 reviewed journal.

14 Q. Is the American Meteorological Society a journal  
15 of climate a periodical that publishes  
16 information regularly used by meteorologists and  
17 climatologists?

18 A. That has been my experience, yes.

19 Q. Is that 1999 Cook article a reliable authority  
20 on drought reconstruction using the Palmer  
21 Drought Severity Index in the continental United  
22 States from the period 1700 to 1978?

23 A. Yes.

24 Q. Is the data developed by Cook used by  
25 climatologists and government agencies to

1 discuss drought severity and frequency in the  
2 period predating meteorological records?

3 A. Yes.

4 MR. McLEOD: I will formally offer  
5 Exhibit 3 for admission of this point.

6 THE HEARING OFFICER: Any objections?

7 MR. ADRIAN: Just a moment, please.

8 MR. STUCKY: I guess we'll offer an  
9 objection. Just a moment ago in the testimony  
10 Mr. Winchester indicated that he wasn't an  
11 expert at any kind of ancient data as it relates  
12 to droughts, whether it be tree rings or  
13 examining river bottoms or whatever. The old  
14 data, just a moment ago he testified in that  
15 regard that he wasn't an expert. So if this is  
16 being offered to demonstrate expert testimony,  
17 which would otherwise not be admissible, that's  
18 our objection.

19 MR. McLEOD: I had understood the  
20 witness actually to indicate his experience  
21 shortage was with respect to methods other than  
22 tree rings, and perhaps he can clarify if that  
23 was his meaning.

24 A. So I have certainly used PDSI tree rings, other  
25 data, to extend hydrologic records before. I am

1 not an expert in converting that raw data in to  
2 things like stream flow.

3 MR. McLEOD: The other point I would  
4 make, Madame Hearing Officer, is I believe the  
5 witness did lay the foundation for admission of  
6 the Cook study as a learned treatise, because he  
7 identified both the publication in which it  
8 appears, and the author, as reliable sources of  
9 the authority on these points. And also has  
10 established that the AMS Journal of Climate is a  
11 trade publication that publishes data at this  
12 time used by professional meteorologists and  
13 climatologists. So it meets two exceptions for  
14 any hearsay objection.

15 THE HEARING OFFICER: I will overrule  
16 the objection. Exhibit 3 will be admitted.

17 BY MR. McLEOD:

18 Q. On the first page of that exhibit, Mr.  
19 Winchester, which is numbered Page 1145 in the  
20 actual article, do the authors make their own  
21 observation noting that limited time span of  
22 meteorological records poses a difficulty for  
23 modeling understanding and forecasting drought?

24 A. Yes.

25 Q. And as part of the purpose of the work as they

1 express it in their article they hope to  
2 alleviate that problem through the use of  
3 centuries long annual tree ring chronologies?

4 A. Yes.

5 Q. On the next page, about halfway down in the  
6 left-hand column, do you see where the authors  
7 point out that drought reconstructions have been  
8 used for purposes such as reevaluating the  
9 relationship between bidecadal drought area  
10 rhythm in the western United States?

11 A. Do you have a more specific paragraph?

12 Q. You know actually I, I don't. In my note.  
13 Let's just skip that one.

14 A. Here it is, yes.

15 Q. Okay. Thank you. So also have the drought  
16 reconstructions been used to study the  
17 teleconnection between drought or wetness and  
18 the El Nino-Southern Oscillation in the United  
19 States?

20 A. Yes.

21 Q. So it would be a technique that has been  
22 scientifically recognized for a range of  
23 purposes?

24 A. Yes.

25 Q. Looking at the graphic in the upper right of

1 that page, can you tell if any of the grid  
2 points that were used in the drought  
3 reconstruction study were in Kansas and if so  
4 how many?

5 A. Yes. This is a map that shows where they  
6 reconstructed PDSI records throughout the  
7 continental United States and there are six  
8 points within the State of Kansas.

9 Q. Moving ahead about nine pages, to number Page  
10 1156 of that record. What information does the  
11 subsection headed Discussion provide as to  
12 whether the drought reconstruction based on tree  
13 ring records have been found object reliable?

14 A. (Witness reviews documents). It says that the  
15 reconstructions have captured a spatial  
16 variability of drought across the United States  
17 with a high degree of fidelity.

18 Q. And how were they able to determine that? Do  
19 they base that on time periods where scientists  
20 have the ability to compare the results of tree  
21 ring analysis against actual meteorological  
22 records?

23 A. Yes. So when you create and extend time series  
24 typically what you do is you start with a  
25 certain period of recent, for example, stream

1 flow data. And then you create a model of what  
2 you think happened in the past, but you don't  
3 use the entire period. So, for example, if you  
4 have a stream gauge from 1920 through the year  
5 2000, you might use the stream flow gauge to  
6 create the relationship from 1950 through 2000  
7 and then compare how you predicted formulas  
8 would work compared to the earlier period, which  
9 you didn't base the correlation on. And then  
10 that would give you a degree of certainty that  
11 when you forecast back farther how accurate that  
12 data was.

13 Q. Same book behind the orange divider there is a  
14 document.

15 MR. McLEOD: I will have the reporter  
16 mark this as Exhibit 4.

17 (City Exhibit 4 was marked for  
18 identification by the Reporter.)

19 BY MR. McLEOD:

20 Q. Mr. Winchester, what is this document?

21 A. The title is North American drought:  
22 Reconstructions, causes and consequences, by  
23 Edward Cook and others.

24 Q. And is there a citation at the top of each page  
25 referring to the publication of this article at

1 Earth-Science Reviews 81 (2007) 93-134?

2 A. Yes.

3 Q. What kind of a publication is an Earth-Science  
4 Reviews?

5 A. It's a peer reviewed journal.

6 Q. Do you know who publishes it?

7 A. I believe it's by science direct, under the  
8 Earth-Science Reviews.

9 Q. As far as you know is the Edward R. Cook shown  
10 as a participating author in that paper the same  
11 Edward R. Cook, who helped produce the 1999  
12 article in Drought Reconstruction in the  
13 Continent of the United States?

14 A. I don't know Edward Cook personally but it is  
15 the same name and he works at the same  
16 university in both publications, yes.

17 Q. Is the methodology in the two articles similar?

18 A. Yes.

19 Q. Is this article a reliable authority on drought  
20 reconstruction methods and findings?

21 A. I believe it is.

22 MR. McLEOD: I will formally offer  
23 Exhibit 4 for admission.

24 THE HEARING OFFICER: Any objections?

25 MR. STUCKY: No objection.

1 THE HEARING OFFICER: Exhibit 4 will be  
2 admitted.

3 BY MR. McLEOD:

4 Q. On the first page there, Mr. Winchester, in the  
5 Abstract, the authors note a network of  
6 centuries-long annual tree ring chronologies has  
7 now allowed for the reconstruction of past  
8 drought over North America covering the past  
9 thousand or more years in most regions. And  
10 these reconstructions reveal the occurrence of  
11 past megadroughts of unprecedented severity and  
12 duration, ones that have never been experienced  
13 by modern societies in North America. What are  
14 the ramifications of that to municipal water  
15 utilities?

16 A. It is important that, and I believe that it is  
17 important that municipalities understand that  
18 there may be droughts more severe than are  
19 recorded in historical, say stream flow or  
20 groundwater elevation data. And the reason is  
21 because if you are planning for a 1% drought,  
22 even if you have hundred years of data, you  
23 don't know whether or not that drought has  
24 occurred or not in the period. By looking at  
25 longer periods of record we can be more

1           confident about the risk that water supplies may  
2           be under.

3       Q.    In your opinion would it be prudent for a  
4           municipality to have at least some supply to  
5           meet basic essential demands in the event of a  
6           megadrought?

7       A.    Yes.   That would be very important.

8       Q.    Turning to the next page, Page 94 in the  
9           article, over in the right-hand column, the  
10          authors note that the 1929 to 1940 dustbowl  
11          drought, and the 1946 to '56 southwest drought,  
12          remains the most severe drought since 1900.  And  
13          they mention that they starting end dates for  
14          these drought were determined by an objective  
15          method based on the duration of running sums of  
16          PDSI values.  Can you explain the summing  
17          technique they are discussing and why that is  
18          used?

19       A.    Certainly.  If you have a drought that is one  
20          year long, but be extreme in saying no rainfalls  
21          at all, no moisture falls at all, you will have  
22          an extremely dry drought.  But if that drought  
23          is bracketed by wet years, while it would be  
24          catastrophic for farmers and ranchers, for  
25          municipalities if they have a year's worth of

1 water in storage, they will be able to get  
2 through that. If you have a drought that's five  
3 or ten years long, it may not be as severe as  
4 the individual drought; but if, for example, the  
5 municipality has two years of water in storage,  
6 then it could run out during a longer period of  
7 drought. So while short droughts are important,  
8 as we talked about before, the duration is also  
9 important. And the way to calculate that, one  
10 way to calculate that, is to take an index such  
11 as the Palmer Drought Index and assign that to  
12 each year of the drought. And then you add that  
13 up over the length of the drought. Sort of like  
14 if you were unemployed for five years and you  
15 could add together your expenses over that time,  
16 you would know if your savings were going to be  
17 adequate to carry you through that time or if  
18 they would not.

19 Q. Does the summing method also help you to  
20 determine as to a particular drought whether  
21 that drought has ended or is continuing for a  
22 particular index period?

23 A. I would say the answer to that is it depends.  
24 It's not uncommon at all for longer droughts to  
25 have a year in the middle of that run that is

1 normal or slightly above normal. And in that  
2 case, my opinion is is that the drought would  
3 not technically be over. Where if you looked at  
4 is it a drought yes or no, is it drought yes or  
5 no. If you say is it a drought and it is  
6 slightly above and then it goes back to a  
7 drought, I would not call that drought broken.  
8 So you have to have a little bit of finesse with  
9 that technique.

10 Q. You are posing there a scenario there where  
11 maybe in the fourth year of a drought that has  
12 been ongoing, you did a PDSI that shows normal  
13 precipitation and soil moisture; but the next  
14 year you have got a negative four again. The  
15 summing method helps you to make an evaluation  
16 of whether that drought is ongoing or broken at  
17 that point?

18 A. Yes. As you do a cumulative sum throughout the  
19 years one high value does not ruin, not ruin, it  
20 doesn't sway the total deficit that's built up  
21 over time. There would be an improvement of  
22 deficit of the PDSI, but it may not recover all  
23 the way to normal.

24 Q. Did you employ a similar summing method to  
25 account for drought duration in comparing

1           droughts shown by drought records and  
2           reconstruction data to identify the  
3           characteristics of the 1% exceedance drought for  
4           your work for the City of Wichita?

5       A.    Yes.

6       Q.    Turning to the next page of the article, Page  
7           95, the authors point out that individual  
8           drought years are not necessarily reflective of  
9           cumulative impact, because they may be offset by  
10          weather conditions the following year. They  
11          note that 1934 was more severe than other  
12          drought years shown and reference annual drought  
13          maps, but was also part of a longer sequence of  
14          drier than average years that resulted in a  
15          catastrophic dustbowl drought. What's the  
16          relevance of those observations?

17       A.    I think it is what we were just talking about,  
18           which is that longer droughts may not in  
19           individual years be as dry as a single drought.  
20           But that the cumulative affect of three, four,  
21           ten, a hundred years of below normal  
22           precipitation, if it's slightly below than  
23           normal, can have greater long term affect than  
24           in an individual year. So, for example, earlier  
25           we talked about the droughts of the 1800s and

1 the 1913, I believe it was, where those were  
2 very dry years, but not dry enough to kill the  
3 native vegetation where the soil stayed in  
4 place. Where in the thirties the drought was  
5 long enough the native vegetation died and the  
6 winds were able to mobilize that in the dust  
7 storms.

8 Q. So for that reason, does modeling methodology  
9 need to consider both the depth of severity and  
10 the duration of the droughts that are being  
11 modeled?

12 A. I believe it does.

13 Q. Moving ahead in the article to three pages in  
14 article 98, in the middle paragraph on the  
15 left-hand column there, the authors say:  
16 Succinctly put, the PDSI is a reflection of how  
17 much soil moisture is currently available  
18 compared to that for normal to average  
19 conditions. Do you concur that that is a useful  
20 and simple working definition of PDSI values and  
21 what they do?

22 A. Yes.

23 Q. Across the page in the right-hand column there  
24 is information on the approximate range of the  
25 index. What is that telling us?

1 A. It tells us that the PDSI typically falls  
2 between plus and minus four, and that there can  
3 be years that are either wetter or dryer than  
4 that.

5 Q. In the black binder, and as part of Exhibit 1,  
6 which has already been marked and admitted, it's  
7 attachment C to the proposal. Please look to  
8 that attachment C, if you would.

9 A. (Witness reviews documents). All right.

10 Q. And what is this document, Mr. Winchester?

11 A. This is a technical memo that I presented to  
12 FAIC, which is a contractor for the City of  
13 Wichita, from extending the drought  
14 reconstruction from PDSI data.

15 Q. Is it summarizing analysis that you performed  
16 and conclusions that you reached based on PDSI  
17 data, including the reconstructive PDSI data,  
18 developed by Dr. Edward Cook based on tree ring  
19 records?

20 A. Yes.

21 Q. When you were in the course of trying to look at  
22 a time period of centuries, for your modeling  
23 work, and for part of that work is trying to  
24 identify the probability of a recurrence of a  
25 particular scale of drought in a century, is

1           there any, any other widely recognized data  
2           available for that purpose than that PDSI data  
3           that's reconstructed from tree rings?

4       A.    I believe tree rings are the most common.

5       Q.    Are you aware of any better data source or data  
6           set that has been recognized for that purpose?

7       A.    No, I am not.

8       Q.    In your paragraph on the first page discussing  
9           the available PDSI data you recognized that in  
10          2004 Dr. Cook expanded his original grid  
11          covering the continental United States to where  
12          it now extends to most of North America. Has  
13          that body of PDSI data also been referred to by  
14          U.S. agencies and climatologists as the North  
15          American drought atlas?

16      A.    Yes.

17      Q.    What do they use that for?

18      A.    It's published online, you can look it up. And  
19           again, it's used for planning work to help  
20           understand how severe droughts could have been  
21           in the past.

22      Q.    Who maintains it online?

23      A.    I believe it's the -- I would have to look. I  
24           don't know off the top of my head. The name you  
25           cited is the actual website it's under.

1 Q. Okay. But you are not sure what agency  
2 maintains that?

3 A. Well, no, I am not.

4 Q. Okay. That's fine. Turning to Page 37, you  
5 mentioned that six of the grid locations from  
6 Dr. Cook's 2004 work following Kansas; is that  
7 correct?

8 A. Yes.

9 Q. Which grid box of Wichita would fall within  
10 geographically?

11 A. South central Kansas.

12 Q. But on that same page you also noted that you  
13 found by comparing the summer PDSI with annual  
14 flows from the Little Arkansas River of Valley  
15 Center, that using the PDSI for southwestern  
16 Kansas provided better correlation between the  
17 stream flow and PDSI; is that correct?

18 A. Yes.

19 Q. Can you expand a little bit on that.

20 A. Yes. So looking to find the best correlation  
21 between PDSI and stream flow I looked at all the  
22 grid points within Kansas and in northern  
23 Oklahoma. And as you said, the southwest Kansas  
24 PDSI correlated best to the stream flows on the  
25 Arkansas and Little Arkansas Rivers. I believe

1           that's because they are upstream of here. And  
2           while there may have been more precipitation  
3           during the '30s and the '50s here, that the  
4           stream flows are more affected by what happened  
5           in southwest Kansas than what happened in this  
6           immediate area.

7       Q.   And for that reason, do you think that that  
8           correlation you found supports selecting that  
9           southwestern Kansas PDSI data rather than the  
10          south central Kansas data by using your  
11          analysis?

12      A.   Yes.

13      Q.   What was the period of record covered by that  
14          southwestern Kansas PDSI data?

15      A.   It was from the years 1887 through 2003.

16      Q.   In the actual exhibit that's before you, do you  
17          see any place where that date period of record  
18          is referenced, where the data sets?

19      A.   Yes.

20      Q.   And looking at that closely is the starting year  
21          actually 1887 or 887?

22      A.   Oh, I am sorry, I must have misspoken, 887.

23      Q.   Going to Page 5 of your technical memorandum, it  
24          reflects that your examination of drought  
25          duration and of severity you further limited the

1 data you relied on for the period of 1640 to  
2 2003. Why did you do that?

3 A. When we looked at the correlation between PDSI  
4 and stream flows, we found there was higher  
5 correlation for a shorter period, because for  
6 the first approximately 200 years there were  
7 only 15 sites where they could correlate tree  
8 rings. And after that there were a larger  
9 number of sites. So by limiting it to the  
10 period with a greater number of tree ring sites,  
11 the correlation was much better. And I felt  
12 that the additional years with a poor  
13 correlation did not outweigh a shorter period  
14 with a better correlation.

15 Q. If you had used the data for the full period 887  
16 to 2003 would that have imported a bias toward  
17 drought?

18 A. It certainly could.

19 Q. Summarized in your discussion there is the  
20 process by which the PDSI values generated from  
21 tree ring chronology were used to review  
22 historic droughts of record for their intensity  
23 and duration, and also in the manner in which  
24 exceeding probabilities for the various droughts  
25 were calculated. Was duration basically

1           determined by counting the number of consecutive  
2           years with below average moisture?

3       A.   Generally, yes.  As I said before, if there was  
4           a single year that was normal, or only slightly  
5           above normal, I also included that.  It was in  
6           the middle of a longer drought sequence.

7       Q.   Do you remember what index, positive index  
8           number you used for the cut off that would have  
9           caused you to conclude the drought was broken if  
10          the number had been brought above that?

11      A.   Yes, .5.

12      Q.   Positive .5?

13      A.   Positive .5.

14      Q.   And then after you had examined the droughts of  
15          record for duration, and by the term of record I  
16          include here the reconstructive record from  
17          paleological data, how then was the exceedance  
18          probability determined for the drought of  
19          various duration?

20      A.   So we started by looking at the number of  
21          occurrences over that period of record.  And so,  
22          for example, if there was, if there were, for  
23          example, 12 droughts that happened that were two  
24          years long, that would be given a recurrence  
25          interval -- I can't do the math in my head off

1 the top of my head -- but that would calculate  
2 the recurrence number for that. And then you  
3 would know that, for say it was a ten year  
4 drought, you would know there were 12 of those  
5 in that period of record.

6 Q. Is there a standard equation that expresses the  
7 methodology used for that?

8 A. Yes, there is.

9 Q. What is that?

10 A. The exceedance probability is you take the  
11 values you are interested in, whether it's flood  
12 events or annual PDSI value, and you put them in  
13 order from either greatest to least, or least to  
14 greatest, depending whether you are looking at  
15 floods or droughts, the exceedance is the rank  
16 you are looking at. For example, if you have  
17 100 data points, you might be looking at the  
18 10th value, the 10th value down list, it would  
19 be the number 10 divided by the total number in  
20 the sample plus one for a safety factor.

21 Q. And then for relative severity in the  
22 comparison, did you sum up the cumulative PDSI  
23 values in the years of each drought?

24 A. Yes, I did.

25 Q. Moving on to Page 6 of the technical memorandum,

1 does the left half of Table 1 depict the  
2 statistical characteristics of droughts with a  
3 calculated exceedance probabilities based on  
4 PDSI data?

5 A. Yes.

6 Q. Looking at that table, for example,  
7 statistically would we expect a 1% exceedance  
8 drought to be a drought of eight years duration  
9 with a cumulative PDSI of -22.4, and a median  
10 PDSI of -2.8?

11 A. Yes.

12 Q. Over on the right half of the table, does that  
13 half of the table identify a combination of  
14 drought years, actual drought years, that would  
15 approximate the statistical characteristics of  
16 the droughts with variance exceedance  
17 probabilities. For example, the four year 4%  
18 exceedance probability drought with a cumulative  
19 index of PDSI 8, -8.8, could be modeled with  
20 data from the actual drought years of 1925 and  
21 '26, and 1981 counted twice, which combination  
22 of years would then also have an actual  
23 cumulative PDSI of -8.8 --

24 A. Yes.

25 Q. -- and part of the effort there is matching the

1 PDSI of the statistical model drought to the  
2 PDSI cumulative PDSI of the years that have been  
3 represented?

4 A. Yes.

5 Q. And in that same table, the ten percent  
6 exceedance drought, is shown with a two year  
7 duration, cumulative PDSI of -4.4 and the table  
8 suggests it could be approximated by an actual  
9 two-year drought, which was the drought of 1925  
10 or '26, but if we look at the numbers for 1925  
11 to '26, does the PDSI cumulative value for that  
12 actual drought show us that it was actually more  
13 severe than the statistical ten percent  
14 exceedance drought because it had an actual PDSI  
15 of -4.9?

16 A. Yes.

17 Q. So these representations representative years of  
18 drought on the right-hand side of the table, are  
19 approximations, but they are not always exact as  
20 the cumulative PDSI may be slightly different  
21 than the statistical drought represented?

22 A. Yes. And while you could go and cherry pick  
23 years from the historical records and make them  
24 match exactly. So for example, you might take  
25 1925 to 1932 for that ten percent number to make

1           it match exactly the -4.4. My feeling is it's  
2           better to use historical sequences where you  
3           can, because we know it happened. So if there  
4           are other forcing things, El Nina, volcanic  
5           activity, sun spots, that affected those in more  
6           than one year longer term carry over, that they  
7           would be happening the same over the historical  
8           period, where if you mix or match years you are  
9           never sure if that's true.

10        Q.    And connecting that up with the 1% statistical  
11           exceedance drought, if you look at statistical  
12           1% exceedance drought in that table, you  
13           selected the actual drought period of 1933 to  
14           '40 as a near fit?

15        A.    Yes.

16        Q.    Was that for the reason you just explained that  
17           that was an actual sequence of years where an  
18           actual drought occurred?

19        A.    Yes.

20        Q.    Even though when we look at the actual  
21           cumulative PDSI, the actual drought period in  
22           the 30s, had a -24.4 compared to the -22.4  
23           cumulative PDSI of the statistical 1% exceedance  
24           drought, correct?

25        A.    Yes.

1 Q. So the relationship between the two would be as  
2 a representative drought the drought of the 30s  
3 was slightly more severe than the 1% statistic  
4 exceedance drought; is that correct?

5 A. Yes.

6 Q. And for the statistical 2% exceedance drought,  
7 also shown on the table, the actual drought  
8 period represented by the years 1952 to '56 and  
9 1959 has a cumulative PDSI of -16.1, compared to  
10 the -15.6 cumulative PDSI of the statistical 2%  
11 exceedance drought, is that correct?

12 A. Yes.

13 Q. So again, there is a slight lack of depth there  
14 in that that comparison would show that the  
15 actual drought is slightly more severe than the  
16 modeled statistical 2% exceedance drought; is  
17 that correct?

18 A. So what that shows is -- I believe that's  
19 correct. Let me see if I can rephrase that for  
20 you. The drought based on the PDSI is six years  
21 long. And when I took the six years starting in  
22 1952, the PDSI was closer to zero, less negative  
23 than 15.6. So by excluding the two years, '57  
24 and '58, but including 1959 in that six years, I  
25 came closest to the calculated cumulative PDSI.

1 Q. Okay. And it is still though, it is still a  
2 slightly more severe cumulative PDSI than the  
3 statistical 2% drought?

4 A. Yes. The historical period had two wetter years  
5 in there that offset.

6 Q. So for, well, let me back up and ask you this.  
7 Are the 1% exceedance and 2% exceedance droughts  
8 some of the most commonly discussed in modeling?

9 A. Yes.

10 Q. And what's the reason for that?

11 A. The 50 and 100 year droughts are just a common  
12 number. It's an arbitrary number. There is no  
13 reason why you pick a particular year. But it's  
14 a very common thing when they talk about the  
15 hundred year flood, the hundred year drought.  
16 While engineers can design systems which will  
17 meet any return interval, 1,000 year drought, it  
18 becomes very uneconomical to do that. So we can  
19 design culverts that will pass the 10,000 year  
20 flood, but if we do it will be very, very, very,  
21 very expensive. If we designed the interstate  
22 highway system to be able to travel over 10,000  
23 year events, society will probably choose not to  
24 do that. A smaller interval, where are willing  
25 to take the risk of a 1% flood or 50% flood or

1 culverts at 10% flood, one that could come every  
2 ten years, because we feel our money can be  
3 spent better places. It's a value system.

4 Q. In the course of your drought modeling work for  
5 water systems, are you frequently asked to model  
6 both the 1% and 2% exceedance droughts?

7 A. And sometimes more, yes; but 1% and 2% is most  
8 common.

9 Q. And as to both of those model droughts, the  
10 table is showing us that the modeled 1% and 2%  
11 droughts are similar to, but not exactly the  
12 same as the historical droughts of the 1930s and  
13 1950s respectively?

14 A. Yes.

15 Q. Mr. Winchester, in the white binder there is a  
16 set of documents behind the tab HCH documents,  
17 and we'll go about 40 pages back in that set.  
18 To the page that's actually numbered in the  
19 upper right Number 44 in that set of documents.

20 A. (Witness reviews documents). All right.

21 Q. For us just to be clear for the record, on the  
22 reverse of numbered Page 44 is the printed  
23 material there that is there in duplex, is it  
24 part of the document we are looking at?

25 A. No, it's not.

1 Q. And, likewise, on the reverse of Page 63 is the  
2 printed material there part of the document?

3 A. No, it's not.

4 THE HEARING OFFICER: Sorry, could you  
5 remind me where we are?

6 MR. McLEOD: The white binder in a set  
7 of documents H C H documents and we are looking  
8 at a document that's between pages numbered 44  
9 and 63 in that set. And we are cleaning up the  
10 fact that there are some duplex things that are  
11 not part of that document printed on the first  
12 and last page.

13 (City Exhibit 5 was marked for  
14 identification by the Reporter.)

15 MR. McLEOD: And I had the reporter  
16 mark that as Exhibit 5.

17 MR. ADRIAN: So is 43 not included?

18 MR. McLEOD: 43 is in, 44 is not.

19 MR. ADRIAN: And same as 63, and 64 is  
20 not.

21 BY MR. McLEOD:

22 Q. So the document that's there from numbered Page  
23 44 through numbered Page 63, Mr. Winchester,  
24 what is that document?

25 A. It's a report called A Thousand Years of Drought

1 and Climatic Variability in Kansas:

2 Implications For Water Resources Management.

3 Q. And who published that document?

4 A. The Kansas Geological Survey.

5 Q. Is this a document that you are familiar with as  
6 the result of having consulted it in your work?

7 A. Yes.

8 Q. Who was the author?

9 A. Anthony Layzell.

10 Q. And is he employed or works with the Kansas  
11 Geological Survey?

12 A. Yes. Or was at that time.

13 MR. McLEOD: Based on the Kansas  
14 Geological Survey status as a research and  
15 service division of a State's institution known  
16 as the University of Kansas, and the statutory  
17 mission of the Kansas Geological Survey to  
18 prepare their reports under the direction of the  
19 State geologist pursuant to KSA 76-322, I will  
20 formally offer Exhibit 5 as a government  
21 document.

22 THE HEARING OFFICER: Any objections?

23 MR. STUCKY: We are going to, well, we  
24 would like some foundation on the exhibit first.

25 THE HEARING OFFICER: More than what is

1 given?

2 MR. STUCKY: One thing we are unclear  
3 on is whether or not there is a file number, if  
4 this is a published report, that's one thing we  
5 are unclear on with regard to this particular  
6 report.

7 THE HEARING OFFICER: Was this a  
8 published report, is that your question?

9 MR. STUCKY: Yes.

10 BY MR. McLEOD:

11 Q. Mr. Winchester, do you know the answer?

12 A. I don't off the top of my head, the title page  
13 is missing on this, I don't know. It's  
14 available online.

15 MR. STUCKY: Our objection is if it's  
16 not a published report there is no documentation  
17 in that regard as to its validity. I don't  
18 think it could be admitted under the grounds  
19 that were offered by the City.

20 MR. McLEOD: I think that there is  
21 enough information on the document to show that  
22 its source is Anthony Layzell working under the  
23 supervision of the state geologist, and the  
24 agency name of the Kansas Geological Survey is  
25 on the first page, the first numbered page. I

1 believe that it does meet the foundational  
2 requirements for admission as a government  
3 document.

4 THE HEARING OFFICER: May I take a look  
5 at it?

6 MR. McLEOD: Yes. (Indicating).

7 THE HEARING OFFICER: Mr. Winchester,  
8 you said this is available online?

9 A. Yes, it is.

10 THE HEARING OFFICER: Are you familiar  
11 with this document being a published study  
12 through the KGS? Where online is it available?  
13 I guess what I am asking is is there a citation  
14 that could be relied upon to find it?

15 A. I see some laptops being passed back and forth.  
16 Do you have an answer to that? The answer is I  
17 don't know, I don't remember.

18 MR. McLEOD: What about from our  
19 colleagues at DWR?

20 THE HEARING OFFICER: For the record,  
21 apparently this is on the KGS website and  
22 identified as KGS open file report 2012-18.  
23 Does that resolve your concern, Mr. Stucky?

24 MR. STUCKY: I suppose so.

25 THE HEARING OFFICER: Okay. I guess

1 the objection is withdrawn.

2 MR. STUCKY: All we would ask for is we  
3 would like a copy of the cover page if we could  
4 have that. That would be helpful.

5 THE HEARING OFFICER: Mr. McLeod, would  
6 you be able to subsequently supply a cover page  
7 for that that indicates that information?

8 MR. McLEOD: Yes, we can do that.  
9 Certainly.

10 THE HEARING OFFICER: Thank you.  
11 Please proceed.

12 BY MR. McLEOD:

13 Q. Mr. Winchester, on numbered Page 3 of the  
14 report, PDSI graphs from the High Plains.

15 THE HEARING OFFICER: Pardon me, Mr.  
16 McLeod, I don't think I officially admitted  
17 that. We'll admit Exhibit 5. Sorry.

18 MR. McLEOD: My mistake, should have  
19 waited for that.

20 BY MR. McLEOD:

21 Q. Mr. Winchester, on numbered Page 3 of the  
22 report, the PDSI graphs from the High Plains  
23 aquifer would appear to show lesser impact of  
24 the 1930s drought in Divisions 8 and 9, but  
25 severe impact in Divisions 1, 4 and 7. What

1           implications of the low PDSI, and other parts of  
2           the state, have for Wichita?

3       A.    Particularly in Division 7 in the southwest  
4           corner of Kansas, because the Arkansas River  
5           comes from that area and much of the rainfall  
6           affects the stream flows downstream.  A very dry  
7           period in Division 7 would result in lower  
8           stream flows in Division 8.

9       Q.    Turning now to numbered page 4 of the report,  
10          Layzell notes:  Regression based tree ring PDSI  
11          reconstructions tend to underestimate extreme  
12          values, although dry extremes are better  
13          represented than wet extremes, but reasonably  
14          accurate in terms of extent and duration.  Does  
15          that mean that the PDSI based on tree ring data  
16          is a better tool for forecasting drought than  
17          forecasting floods?

18      A.    Yes.

19      Q.    Do you know why that is?

20      A.    Yes, because droughts are typically long term,  
21          they are soil moisture deficit issue for trees.  
22          So you can have a flood that lasts a week and  
23          the tree ring growth won't be tremendously  
24          affected by that.  Where if you have a drought  
25          that lasts multiple years, the tree rings will

1 definitely be thinner.

2 Q. At the bottom of the same page the report says:  
3 The PDSI data indicate that western Kansas has  
4 experienced more severe droughts than eastern  
5 Kansas over the past thousand years. Do  
6 droughts in western Kansas have hydrological  
7 impacts for Wichita?

8 A. Yes.

9 Q. Why is that?

10 A. Stream flow primarily, because the Arkansas  
11 River passed through southwest Kansas before it  
12 gets to the Wichita area.

13 Q. Going back to numbered Page 11 of the report  
14 there is mention at the bottom that the longer  
15 megadrought on record occurred in north central  
16 Kansas and lasted 110 years. That discussion  
17 then continues on to the next page where Layzell  
18 also notes that that megadrought was more much  
19 more severe than a 20th century drought. Would  
20 an historic 20th century drought include the  
21 dustbowl drought of the 1930s?

22 A. Yes.

23 Q. Does it follow that Layzell's observation leads  
24 to the conclusion that Kansas has experienced  
25 drought conditions much worse in duration and

1 severity than the 1930s dustbowl drought?

2 A. Yes.

3 Q. And given that the duration of that 1930s  
4 drought was the same as the duration of the  
5 statistical 1% exceedance drought. And a 24.4  
6 negative PDSI of the 1930s drought is closely  
7 similar to the -22.4 PDSI of the 1930s  
8 drought -- excuse me, but I believe, I believe  
9 that that should be the modeled 1% exceedance  
10 drought.

11 Can we conclude from Layzell's  
12 information that Kansas has experienced drought  
13 conditions much worse in duration and severity  
14 than the 1% exceedance drought?

15 A. Yes.

16 Q. Turning to numbered page 14 of the Layzell  
17 report, there is a statement that the Medieval  
18 warm period has been suggested as an approximate  
19 analog for likely future warming and drought  
20 conditions, citing Woodhouse 2010, and thus  
21 serves as an important period to investigate.  
22 What was the Medieval warm period?

23 A. The Medieval warm period was a time when there  
24 was, in North America, and in parts of Europe,  
25 temperatures were abnormally warm compared to a

1 long term average. People suspect it either  
2 occurred, well, we don't know why it happened.  
3 The current guess is it was either a lack of  
4 sun, or not a lack, a change in solar activity,  
5 a lack of volcanoes putting dust in the  
6 atmosphere, but we are not certain why.

7 Q. The discussion in the report also notes: The  
8 occurrence of several megadroughts over the  
9 medieval warm period is troubling as it suggests  
10 the climate system has the capacity to get stuck  
11 in drought-inducing modes over the Great Plains  
12 that can last several decades to a century or  
13 more.

14 A. Yes, it does.

15 Q. Turning to numbered page 15 of the report, at  
16 the end of the next-to-the-last paragraph there,  
17 Layzell again discusses differences in drought  
18 frequency in western and eastern Kansas, stating  
19 in eastern Kansas the probabilities are lower,  
20 as drought as severe as the dustbowl have only  
21 occurred about once every century. Is that  
22 observation consistent with your conclusion that  
23 the 1930s dustbowl drought approximates the 1%  
24 exceedance drought?

25 A. Yes, it is.

1 Q. Turning to Page 16 of the report under Policy  
2 and Management Implications. Layzell notes:  
3 Water systems are commonly designed to handle  
4 the drought of record identified as the most  
5 severe hydrological event from the instrumental  
6 record. For the State of Kansas the 1950s  
7 drought, 1952 through '57, remains the planning  
8 benchmark and is used to calculate reservoir  
9 yield through droughts with a 2% chance of  
10 occurrence in any one year, citing to a  
11 regulation, K.A.R. 98-5-8.

12 Although the individual years in the  
13 1950s drought may have seen more severe drought  
14 conditions than the individual years in the  
15 1930s drought, does the longer duration of the  
16 1930s drought, and it's higher cumulative PDSI  
17 suggest that it was actually a more severe  
18 drought than the 1950s drought?

19 A. For water supply systems that depend on  
20 carryover storage, yes.

21 Q. And then continuing discussion in Policy and  
22 Management Implications, does the Layzell report  
23 go on to recognize that the long term record of  
24 drought variability shows the 1930s and 1950s  
25 droughts were not unusual, and droughts of

1 greater severity and duration than the 1930s and  
2 1950s droughts have occurred in the past?

3 A. Yes.

4 Q. And then Layzell goes on to state: Such severe  
5 drought conditions are of great concern because  
6 modern day agricultural and water systems may  
7 not have the resilience to survive droughts  
8 beyond the worst-case scenario of the past  
9 hundred years.

10 If water systems plan only for the 2%  
11 exceedance drought, are they effectively  
12 planning for the worst-case scenario droughts of  
13 the past hundred years?

14 A. Statistically, no.

15 Q. And would that be because in a significant  
16 sense, because of its duration of the 1930s  
17 dustbowl drought, which approximates the 1%  
18 exceedance drought, would likely have a more  
19 severe cumulative impact due to the longer  
20 duration?

21 A. For the Wichita area, yes.

22 Q. And that reference in the report to those more  
23 severe drought conditions being of great  
24 concern, that appears to be specifically based  
25 on the problem that water systems may not have

1 the resilience to survive such droughts; is that  
2 correct?

3 A. Yes.

4 Q. Is this concern greater for a large municipal  
5 system than it would be for a small one?

6 A. Yes.

7 Q. Why is that?

8 A. So, for example, Wichita is the largest city in  
9 Kansas. And so it has, for example, the largest  
10 hospital in Kansas, and it has a large military  
11 base. And it has a denser area of housing. One  
12 example would be where you have more apartments,  
13 those people have less ability to reduce their  
14 per capita use than a city that where everyone  
15 has a full size lot with a house. Those people  
16 can cut back, for example, in severe drought can  
17 say we will ban outdoor watering, sorry, your  
18 lawns going to die. In a place like Wichita  
19 with a denser population, there is less ability  
20 to provide temporary drought conservation. And  
21 the services that are provided in their largest  
22 airport in the state, it's the impacts of  
23 shutting down, for example, the Wichita Airport  
24 would be much larger than for a small regional  
25 airport.

1 Q. Turning to Page 17 of the Layzell report. In  
2 the middle paragraph the report says: Woodhouse  
3 and Overpeck highlight two factors that may  
4 compound the susceptibility of the Great Plains  
5 to future drought. Increased vulnerability due  
6 to land use practices, specifically the use of  
7 irrigation to bring marginal lands in to  
8 agricultural production; and, two, the enhanced  
9 likelihood of drought due to global warming. As  
10 the reports references the medieval warm period,  
11 does that paragraph reflect Layzell's concern  
12 that severe droughts may become increasingly  
13 common in the Great Plains with a consequence of  
14 global warming?

15 A. Yes.

16 Q. Does the Layzell report also recognize that  
17 certain factors present challenges to effective  
18 water resource management including, one,  
19 current levels of uncertainty in predicting  
20 future drought occurrence; and two, the  
21 assumption of climatic stationarity by water  
22 resource planner; and, three, competing  
23 management interests?

24 A. Yes.

25 Q. In simple terms, what is meant by that

1 assumption of climatic stationarity by water  
2 research planners?

3 A. Stationarity in this context means that the past  
4 represents the future. So if we look at the  
5 stream low records of Wichita, the Arkansas  
6 River, the stream flow that we have seen in the  
7 past nine years represents what will happen in  
8 the future. And as we look at longer term  
9 records we believe that the gauge record of the  
10 past does not represent the long term  
11 variability; and, therefore, we are perhaps  
12 exposed to larger risks than we would otherwise,  
13 if all we did is look at the gauge record.

14 Q. Then Layzell ultimately concludes on Page 17 a  
15 discussion, and indeed, his entire report with a  
16 statement: Given these challenges, it would be  
17 wise to adopt a problematic approach to drought  
18 forecasting and planning that incorporates the  
19 full range of drought variability indicated in  
20 the paleoclimatic record.

21 Does this indicate the planners would  
22 be wise to evaluate and plan for potential  
23 drought occurrences shown by the paleoclimatic  
24 record, rather than focusing only on the most  
25 severe drought of instrumental record?

1 A. Yes.

2 Q. And would an example be a consideration of the  
3 1% exceedance drought which combines using PDSI  
4 because there are not hundred years of extreme  
5 gauge records near Wichita?

6 A. Yes.

7 Q. In the course of your own work for the city, did  
8 you recommend that planning be done with some  
9 minimal amount of storage held in reserve to  
10 guard against a drought with an exceedance  
11 probability of less than 1%?

12 A. I believe I did, but I don't recall an amount.

13 Q. Find a blue tab in that white binder.

14 MR. McLEOD: It's a document which I am  
15 handing the reporter to mark as Exhibit 6.

16 (City Exhibit 6 was marked for  
17 identification by the Reporter.)

18 BY MR. McLEOD:

19 Q. Mr. Winchester, are you familiar with this  
20 document we have marked as Exhibit 6?

21 A. Yes.

22 Q. Is this an article which shows it was published  
23 in the Bulletin of the American Meteorological  
24 Society in 1998 the same work by Woodhouse and  
25 Overpeck that was cited several times as a

1 reference stating statements in the Layzell  
2 report in the Kansas Geological Survey?

3 A. Yes.

4 Q. Does this paper appear to you to be a reliable  
5 authority on drought reconstruction modeling and  
6 analysis using information from the  
7 paleoclimatic record?

8 A. Yes.

9 MR. McLEOD: I offer the exhibit for  
10 admission.

11 THE HEARING OFFICER: Any objections?  
12 Hearing none, Exhibit 6 will be admitted.

13 BY MR. McLEOD:

14 Q. Turning about 17 pages in to the exhibit, to the  
15 page which is numbered, Page 2710 of the  
16 Woodhouse and Overpeck article, the authors say:  
17 The paleoclimatic data suggest a 1930s magnitude  
18 dustbowl drought occurred once or twice a  
19 century over the past 300 to 400 years, and a  
20 decadal-length drought once every 500 years. Is  
21 there observation with respect to the frequency  
22 of a 1930s magnitude dustbowl drought consistent  
23 with your use of the 1930s drought as an  
24 approximation of the 1% exceedance drought?

25 A. Yes, it is.

1 Q. Shifting gears now to turn to the topic of  
2 computer modeling. The experience shown in your  
3 resume included experience with the use of a  
4 model called RESNET, and also specific work on a  
5 project to develop a MODSIM model of the City of  
6 Wichita's well water system to evaluate  
7 potential water supply alternative. What is  
8 RESNET?

9 A. RESNET is called a circulating network model  
10 that's used to simulate, you can use it for any  
11 sort of water resources planning, but typically  
12 municipal work was developed by Burns &  
13 McDonnell or an employee of Burns & McDonnell.

14 Q. Is there any relationship between that RESNET  
15 program and the MODSIM model that you worked  
16 with?

17 A. Yes. My understanding is Gene Foster, who  
18 worked at Burns & McDonnell, was a student under  
19 John Labadie at Colorado State University. And  
20 at the Dr. Labadie was enhancing, well, he  
21 actually got the model from the Texas Water  
22 Development Board, he was enhancing it and was  
23 providing students with copy of a source code.  
24 Gene Foster got a copy of that source code and  
25 used it as a sister or a daughter model.

1 Q. And the source code that he got was from what  
2 model program?

3 A. I am not sure of the name for it. I know it  
4 came from the Texas Water Development Board.

5 Q. Do you know if it was a version of the MODSIM?

6 A. MODSIM was based on that earlier work.

7 Q. Did that also come to be true of RESNET then?

8 A. Yes.

9 Q. I think the environmental impact statement for  
10 the proposal is there with the proposal, already  
11 admitted as part of Exhibit 1, in the black  
12 binder.

13 A. (Witness reviews documents).

14 Q. I am sorry. It might actually be in the white  
15 binder. Looking for the document in the white  
16 binder, behind an orange tab marked ASR  
17 Environmental Impact Statement.

18 MR. McLEOD: Let's mark that as Exhibit  
19 7.

20 (City Exhibit 7 was marked for  
21 identification by the Reporter.)

22 BY MR. McLEOD:

23 Q. On the front page of that document, Mr.  
24 Winchester, can you determine whether this  
25 document is a document of the U.S. Department of

1 the Interior Bureau of Reclamation?

2 A. That's what's on it.

3 MR. McLEOD: I will offer that  
4 document, and its attachments, as U.S.  
5 Department of the Interior Bureau of  
6 Reclamation.

7 THE HEARING OFFICER: Any objections?

8 MR. STUCKY: I will object. This  
9 document isn't mentioned in Mr. Winchester's  
10 expert opinion, and he doesn't offer any opinion  
11 based on what's on this particular document.  
12 Although I am not necessarily objecting to this  
13 document maybe being used in a later witness, I  
14 am objecting to Mr. Winchester testifying to  
15 what's in this document. It's not mentioned in  
16 his report and nothing in the subject matter  
17 even falls within that exhibit.

18 MR. McLEOD: I think there are modeling  
19 issues within the scope of Mr. Winchester's  
20 report. And the intent would be I am asking of  
21 this document really to ask him a few limited  
22 questions about what the document shows in terms  
23 of results from the RESNET model having been  
24 submitted to and accepted by the Bureau of  
25 Reclamation in the course of this Environmental

1 Impact Statement.

2 THE HEARING OFFICER: Within that  
3 limited scope do you still object?

4 MR. STUCKY: We'll allow it.

5 THE HEARING OFFICER: Okay. Exhibit 7  
6 will be admitted.

7 BY MR. McLEOD:

8 Q. Mr. Winchester, going back in the exhibit to the  
9 Appendix A on hydrology, have you seen that  
10 appendix before?

11 A. (Witness reviews documents). Yes.

12 Q. And the first paragraph of that appendix says,  
13 it refers to the RESNET name as coming from the  
14 reservoir network. It says: The model performs  
15 a daily simulation of reservoirs and streams as  
16 a circulating network and uses least cost  
17 optimizing procedures to arrive at an optimized  
18 solution.

19 Is that an accurate general statement  
20 of the program's general function?

21 A. Yes.

22 Q. This page also shows that if you put in a set of  
23 the required general data set for an 85 year  
24 model simulation period, the model would  
25 calculate a daily water balance and the

1 resources needed for the water supply system  
2 that period. As far as having the capability  
3 within that model to identify a 1% drought would  
4 that 85 year simulation period be too limiting?

5 A. To determine whether or not it was 100 year  
6 drought, yes.

7 Q. Why would that be?

8 A. There would not be hundred years of data  
9 available.

10 Q. And then based on your recollection from  
11 previous reviews of that appendix, does the rest  
12 of the information there in the appendix say,  
13 basically consist of model simulation in a  
14 series of attachments providing information to  
15 the Bureau of Reclamation, that they had  
16 requested, to further document the development  
17 of that RESNET model, the aquifer stream,  
18 gain-loss table, development of historic  
19 discharge and historic evaporation from the  
20 Cheney Reservoir?

21 A. Yes.

22 Q. Mr. Winchester, in addition to your work to  
23 model the PDSI characteristics of a 1% and 2%  
24 drought, did the City of Wichita also retain  
25 your firm to evaluate the RESNET model used to

1 simulate various well water supply projects?

2 A. Yes.

3 Q. Did the scope of that work also include model  
4 documentation and training of city staff so they  
5 could assume the function of operating the model  
6 to evaluate future supply alternatives and  
7 conservation initiatives?

8 A. Yes.

9 Q. In the course of discussing the proposed  
10 modifications to RESNET, city staff, did you  
11 become aware that there were issues with the  
12 user interphase features of RESNET such that the  
13 RESNET model initially proposed might not be  
14 sufficiently user friendly, and would be  
15 difficult for the city staff to use?

16 A. Yes.

17 Q. As the result of that, did you recommend an  
18 alternative approach to using a modified RESNET  
19 program?

20 A. Yes.

21 Q. What was that approach?

22 A. So we offered to the City that the RESNET model  
23 that they were using essentially had no user  
24 interphase. So you had to be a programmer to  
25 modify things like pipeline sizes or reservoir

1 capacities. And we suggested to them that they  
2 look at other model engines and we provided  
3 several. They ended up choosing the MODSIM  
4 model, which is available from Dr. John Labadie  
5 at State Colorado University.

6 Q. And in that sense they approved your  
7 recommendation?

8 A. They actually chose it; but, yes.

9 Q. Was part of your work for the City to recreate  
10 and verify the data in RESNET for use in MODSIM?

11 A. Yes.

12 Q. Were you supposed to transfer the data from  
13 RESNET in to MODSIM and then test and replicate  
14 to see if the results were similar?

15 A. Yes.

16 Q. After conversion of the RESNET model to MODSIM  
17 DSS, did you test that MODSIM DSS model to  
18 verify that it would replicate the RESNET  
19 results, at least to the point that the results  
20 of the two models would be the same for  
21 practical purposes, if not identical?

22 A. Yes.

23 Q. Did you also remove from the model those  
24 features that did not actually correspond to  
25 existing features of the City system and adjust

1           some data on system capacities to conform the  
2           actual system capacities?

3       A.    Yes.  The RESNET model had some alternatives for  
4           water supplies that the City no longer felt were  
5           necessary, so we did not include those in the  
6           new model.

7       Q.    So that part would have been just a  
8           simplification of the model?

9       A.    Yes.

10      Q.    Did anyone peer review the converted model?

11      A.    Yes.

12      Q.    And who?

13      A.    It was Burns & McDonnell, who was the company  
14           that developed the RESNET model.  So they were a  
15           very reliable authority to do that.

16      Q.    What sorts of simulations does the MODSIM DSS  
17           model now enable the City to run?

18      A.    So the MODSIM model now has been used for two  
19           primary purposes.  The first was to look at  
20           different alternatives, water supply  
21           alternatives.  So, for example, in the City's  
22           plumbing system are there limitations that could  
23           be overcome by there upsizing pipes or providing  
24           more storage.  If you added water supply from  
25           some new source, would that cover a shortage in

1 the area. And the second was to look at this  
2 long term, the longer term drought.

3 Q. Please turn in the black binder to the proposal,  
4 which has been admitted as Exhibit 1. And  
5 within that document to Page 2-4 within the  
6 proposal. Is the screen graphic shown there one  
7 of the regular user interphase features of the  
8 MODSIM DSS model?

9 A. Yes.

10 Q. And does that graphic depict for the user both  
11 the resources of the system and environmental  
12 factors, such as river losses, that are  
13 impacting those resources?

14 A. Yes, it does.

15 Q. Does the model calculate extreme gains and  
16 losses from and to the adjacent aquifers as the  
17 result of modeled conditions?

18 A. Yes, it does.

19 Q. Do you recall, based on the information that you  
20 had at the time, does the Equus Beds aquifer  
21 contribute water to the Little Arkansas River at  
22 all elevations?

23 A. Yes, it does.

24 Q. And is its contributonal receipt of water from  
25 the Big Arkansas River dependent upon varying

1 groundwater elevations?

2 A. Yes.

3 Q. After you had constructed the MODSIM DSS model,  
4 tested it against RESNET, and conformed it to  
5 the actual features and capacities of the City's  
6 system, did you also then use the model to  
7 generate simulations to evaluate how various  
8 water supply alternatives might impact system  
9 yield to the 1% and 2% design droughts?

10 A. Yes, I did.

11 Q. In your baseline simulations, that is, those  
12 simulations with existing features and  
13 capacities, with the 1% and 2% droughts, what  
14 did the results show in terms of whether and  
15 when there would be likely shortages?

16 A. In a broad sense for future demands, we found  
17 that there were twenty constrictions within the  
18 City's system where it would not be able to meet  
19 peak demands.

20 Q. So the issues generally occurred at peak day  
21 demand times in the modeling?

22 A. Depending on the demand level you put in the  
23 model, yes.

24 Q. Do you recall what it looked like using 72,000  
25 acre feet of demand, what the results looked

1           like?

2       A.    I remember that we modeled up to the point where  
3           there was not a shortage, and it may be 72,000,  
4           and then the next step up is 73,000.  I don't  
5           remember what the cut off was, but when you took  
6           the next step in to, that the higher level of  
7           demand you would see individual days in the  
8           period of record we were using, where the model  
9           could not meet the demand.

10       Q.   But those shortages, again, those would have  
11           been on peak days, limited in duration, in your  
12           opinion maybe of such a limited extent they  
13           could have been avoided by demand management?

14       A.    Yes.  Those shortages were single day events.  
15           We used the same demand pattern every year and  
16           repeated it throughout the period of record.  
17           And so there was one day that had the highest  
18           demand, and the shortage happened on just that  
19           one day.  So, yes, if the City knew, wow, it is  
20           going to be really hot tomorrow, they could say  
21           no outdoor lawn watering to get through that  
22           peak period.

23       Q.    For purposes of the 1% drought scenarios how was  
24           the model adjusted?

25       A.    So the data that came from RESNET had the longer

1 period of record during the twenties through  
2 what was current at the time. When you are  
3 looking at a critical period, like a 1% drought,  
4 you don't need to model all eight years and  
5 spending the computer time waiting for it to go.  
6 So we put in a ten-year period of record up for  
7 the 1% of the 1930s and just ran that to make  
8 our analysis. So I suppose to answer your  
9 question more precisely, we removed later years  
10 after the 1930s through the present. Used to be  
11 the whole creative record and we just simulated  
12 for the 1% drought just the '30s essentially.

13 Q. In terms of the training that was a function of  
14 that engagement, were city staff able to  
15 successfully complete the training and assume  
16 future operation of the MODSIM model?

17 A. Yes. As part of that I came to the City of  
18 Wichita and spent nearly a week here training a  
19 minimum of two other staff members on how the  
20 model was constructed and how to make runs using  
21 various assumptions increasing pipe sizes or  
22 reducing storage, whatever you wanted to. And  
23 then I provided about a year and a half of  
24 technical support remotely from Boulder.

25 Q. And did city staff continue to consult with you

1 for review of their MODSIM DSS modeling of the  
2 1% drought scenarios that were generated in  
3 support of the proposal?

4 A. Yes, they did.

5 Q. Mr. Winchester, if you would turn in the  
6 proposal to section 2.3, which is captioned,  
7 Integrated Water Resources Management During the  
8 1% Drought using MODSIM DSS. Take a moment to  
9 review that.

10 A. (Witness reviews documents). All right.

11 Q. In your opinion is the information that is  
12 stated in that section of the proposal stated  
13 accurately?

14 A. Yes.

15 MR. STUCKY: Wait a minute. I will  
16 object to that one. That's grossly leading. We  
17 don't even know what we are referring to as far  
18 as whether or not it is accurate. I am not  
19 clear, I guess, from the question if we could  
20 rephrase it.

21 MR. McLEOD: I think that any witness  
22 can look at a paragraph or section of a text,  
23 Your Honor, and say whether they believe that  
24 factually it is set forth accurately. I don't  
25 know that that's leading at all.

1 MR. STUCKY: But what paragraph we are  
2 referring to? That's my question.

3 MR. McLEOD: We are referring to the  
4 section of the proposal 2.3, Integrative Water  
5 Resources Management During a 1% drought.

6 MR. STUCKY: And the question is  
7 whether or not this entire section is accurate?

8 MR. McLEOD: Yes. In the witness'  
9 opinion.

10 MR. STUCKY: All right.

11 THE HEARING OFFICER: I am sorry, are  
12 you --

13 MR. STUCKY: We'll withdraw, if we are  
14 afforded the same type of leniency when we  
15 present our testimony, understanding that  
16 hopefully will be the case, we'll withdraw the  
17 objection.

18 MR. McLEOD: And I don't have further  
19 questions for this witness.

20 THE HEARING OFFICER: Okay. It's about  
21 11:00 o'clock. We have gone two hours. Before  
22 we move in to the next questioning would  
23 everyone be agreeable to about a ten minute  
24 break? Let's go off the record. We'll be back  
25 in about ten minutes.

1 (REPORTER'S NOTE: At this time,  
2 11:00 a.m., a recess was taken, after which,  
3 11:15 a.m., the following proceedings were  
4 held:)

5 THE HEARING OFFICER: We are back on  
6 the record. It is 11:15. And I believe we are  
7 in cross examination from Mr. Winchester. I  
8 think the order was going to be DWR next. So  
9 shall we move the mic over to you?

10 MR. OLEEN: DWR has no questions.

11 THE HEARING OFFICER: That's great.  
12 Groundwater management, you are next.

13 CROSS EXAMINATION

14 BY MR. STUCKY:

15 Q. All right. Mr. Winchester, I am going to walk  
16 through some of the aspects of your testimony  
17 from just a moment ago. And we are going to  
18 start out with the beginning of your testimony.  
19 You talked about the Palmer Drought Severity  
20 Index; is that correct?

21 A. Yes.

22 Q. Now, with respect to the Palmer Drought Severity  
23 Index, why was that originally developed? Was  
24 it developed because there was concerns with  
25 data variability of other models that had been

1           used previously? Was that part of the reason it  
2           was developed?

3       A.    I believe it was the first to actually develop  
4           those that had the ability to look at droughts  
5           in a long term in a uniform way.

6       Q.    Isn't it true that one of the critiques of the  
7           Palmer Drought Severity Index is the fact that  
8           it's based on approximation; is that correct?

9       A.    Yes.

10      Q.    And another critique of the Palmer Drought  
11           Severity Index is the fact that there is an  
12           inability to standardize some of the data; is  
13           that correct? Or standardize some of the  
14           results? Is that another critique of it?

15      A.    Could you talk more about standardize?

16      Q.    Well, I guess it goes hand in glove with the  
17           approximation. It's just making projections or  
18           approximations over time. In fact, there is  
19           critiques that the data, because of that, isn't  
20           as reliable, is that true?

21      A.    It's certainly not perfect.

22      Q.    Okay. Now, would you say that there is aspects  
23           of the Palmer Drought Severity Index that are  
24           arbitrary in nature?

25      A.    There probably are.

1 Q. Can you tell me some of those aspects of the  
2 Palmer Drought Severity Index that are  
3 arbitrarily in your view?

4 A. One would be that while it was developed for the  
5 entire continent of the United States, parts of  
6 North America, those do not all have the same  
7 historical instrumental record. So you are  
8 comparing in different parts of the country with  
9 longer periods of record versus the shorter  
10 periods in other parts.

11 Q. So one issue with this index is we have perhaps  
12 good data in perhaps the eastern United States  
13 and perhaps not as good as data in the midwest,  
14 would that be an accurate statement?

15 A. If you mean by good, you mean period of record,  
16 it's probably not so much a period of record as  
17 it is a density of record.

18 Q. The density of record is not as good as in the  
19 midwest, is that a true statement?

20 A. That could be a true statement.

21 Q. Now, along the lines of our data points where we  
22 indicate we have more data out in the east and  
23 there is less data in the midwest, would that be  
24 a true statement?

25 A. I have never looked at that, I don't know.

1 Q. Well, let me ask you this, aside from a  
2 nationwide analysis of it, if you look at the  
3 Palmer Drought Severity Index as it applies to  
4 different regions, there is variables and that  
5 would skew the results as you go from one  
6 region, like a mountainous region to a plains  
7 region; is that correct?

8 A. I don't know that I would use the word skew, I  
9 would say affect.

10 Q. It would make the results different depending on  
11 the region you are in; is that correct?

12 A. It could.

13 Q. Okay. For example, the drought, the Palmer  
14 Drought Severity Index doesn't really take into  
15 account snow or ice very well, does it?

16 A. That's correct.

17 Q. And so, for example, if we had a major event  
18 where it's snowing or there is ice, that  
19 wouldn't be taken into account, is that true?

20 A. It might not be.

21 Q. Okay. But it could be true, correct?

22 A. It could be true.

23 Q. So, for example, as we are applying the Palmer  
24 Drought Severity Index to the midwest, for  
25 example, and we have a cold winter with a lot of

1 snow and ice in a particular winter and it all  
2 melts suddenly, the Palmer Drought Severity  
3 Index may not account for that very well, is  
4 that true?

5 A. That's correct.

6 Q. Now tell me, does the Palmer Drought Severity  
7 Index take into account evapotranspiration?

8 A. Indirectly, yes.

9 Q. How does it take that into account?

10 A. So the Palmer Drought Severity Index is  
11 basically a soil moisture, basically calculating  
12 soil moisture and it looks at both the  
13 contributions from precipitation and then  
14 depletions from, it could be infiltration of  
15 deep groundwater, it could be loss through  
16 evaporation or transformation through plants.

17 Q. So that's just an indirect correlation, is that  
18 true?

19 A. It's one of the inputs used in the model, yes.

20 Q. Now, one other critique of the Palmer Drought  
21 Severity Index is the fact it doesn't take into  
22 account recharge rates, is that a true  
23 statement?

24 A. Recharge from what?

25 Q. Recharge from water.

1 A. From surface water or groundwater?

2 Q. Surface water.

3 A. So infiltration, for example, rain events?

4 Q. Correct.

5 A. I believe that's not correct.

6 Q. Explain what you mean by that.

7 A. I mean that has, has a methodology for  
8 calculating soil moisture, it includes  
9 contributions to the soil moisture from  
10 precipitation.

11 Q. But if there was a major flood event, for  
12 example, it wouldn't do a good job from taking  
13 that into account; is that correct?

14 A. It depends on the time scale it's calculated on,  
15 but there is a chance it could miss that, yes.

16 Q. And so if the recharge events were either sudden  
17 or slow, depending on the nature of it, it may  
18 not accurately account for that, is that a true  
19 statement?

20 A. Probably, yes.

21 Q. Okay. And one other critique of the Palmer  
22 Drought Severity Index is the fact that it just  
23 relies on the available data; is that right?

24 A. Yes.

25 Q. And so it's only as good as the data that it's

1 based on, is that true?

2 A. That is one limitation, yes.

3 Q. Now, one, or another question with respect to  
4 that, does the contour of the land, does that,  
5 does that affect the implications of the Palmer  
6 Drought Severity Index?

7 A. I am not familiar enough with the calculations  
8 to know that.

9 Q. And so as you are sitting here today, if I were  
10 to ask you questions based on the contour of the  
11 land in western Kansas, for example, versus the  
12 contour of the land in this area, you wouldn't  
13 have an opinion on that; is that correct?

14 A. I would not have an opinion, correct.

15 Q. And let's, let's actually jump to Exhibit 2,  
16 which was your CV. Okay?

17 A. (Witness reviews documents). All right.

18 Q. Now, in your CV you, which is long and has a lot  
19 of detail to it. Is there anything that  
20 indicates that you have analyzed stream flows?

21 A. Certainly.

22 Q. Tell me what you have done to analyze stream  
23 flows.

24 A. To keep time from escaping through our fingers,  
25 what specifically are you looking for?

1 Q. Well, for example, have you analyzed stream  
2 flows in specifically western Kansas, in the Big  
3 Arkansas River? In fact, there is nothing in  
4 your resume that indicates you have done such  
5 research; is that correct?

6 A. Well, it's under the, this resume is divided in  
7 to two areas. It's both a broad topic area,  
8 water rights, water research, modeling; and then  
9 in the back there are specific cases. And in  
10 the work I have done for the City of Wichita,  
11 yes, I have looked at available stream flow,  
12 long term available stream flow data in western  
13 Kansas.

14 Q. Would you consider yourself an expert on stream  
15 flow events in western Kansas?

16 A. It depends on the context.

17 Q. Explain what you mean by that.

18 A. If you are talking about things like flood  
19 events, no, I have not been retained to look at  
20 those. If you are talking about drought, long  
21 term drought as it could be indicated by stream  
22 flows, then, yes, I have been. That's why I am  
23 here.

24 Q. And let me just ask a little more detail on  
25 that. Do you have any expertise on the events

1           that would impact a stream flow as a river  
2           starts in western Kansas and as it travels  
3           across the state? Would you have any expertise  
4           on the events that would impact that stream  
5           flow?

6        A.    I would go farther than that and say all the way  
7           to Colorado, the headwaters of the Arkansas.

8        Q.    What is your expertise in that regard?

9        A.    So I am a water rights opinion for Colorado  
10           Springs, I do their water right opinion hearing  
11           when they go to trial, and they have water  
12           rights from the headwaters of the Arkansas down  
13           to essentially John Martin.

14       Q.    Does the Big Arkansas River, for example,  
15           generally flow in western Kansas?

16       A.    At times.

17       Q.    How often?

18       A.    I would have to go back and look at that. It's  
19           been a long time since I looked at it.

20       Q.    Would you say over half of the time? Would you  
21           say under half the time?

22       A.    I think it depends where you are looking at.  
23           From Colorado's perspective certainly the  
24           threshold is at Garden City.

25       Q.    So an extreme, so what you mean by that is that

1 west of Garden City it more rarely flows, is  
2 that what your opinion is?

3 A. I think it depends more on the specific  
4 circumstance you are looking at. I think, well,  
5 I know that that the compact delivery  
6 requirements have been in dispute in the past  
7 between Colorado and Kansas. But if you want me  
8 to look at, well, refresh my memory so I can  
9 speak accurately to that, I am glad to do that;  
10 but I don't have that off the top of my head.

11 Q. The answer is you don't know how often it flows,  
12 would that be a true statement?

13 A. I don't recall at this time.

14 Q. Now, also on Exhibit 2 in your CV, you mention a  
15 number a lot of analysis you have done with  
16 respect to drought, and things of that nature.  
17 Tell me, besides this particular case, when have  
18 you analyzed the impact of a drought on an  
19 aquifer other than this case?

20 A. Earlier this year we built a water supply model  
21 for Steamboat Springs, Colorado where part of  
22 their water supply, like Wichita's, comes from  
23 surface water storage and part of it comes from  
24 groundwater development. We look at the  
25 implications of low precip on that aquifer and

1           how it would be affected by that. Before that  
2           we have looked at, we are water resources  
3           modeling engineers for the City of Aurora,  
4           Colorado. Aurora is the third largest  
5           municipality in the State of Colorado, very  
6           similar size to the City of Wichita, it's about  
7           375,000 people. We have a model there that  
8           covers three basins, Colorado, South Platte, the  
9           Arkansas, and we looked at groundwater levels in  
10          that model, they have, not really ASR, reused  
11          project, take water off the river below their  
12          waste water plant, pump it up and retreat it in  
13          to potable water. So that has been an ongoing  
14          client of mine since the year 2000.

15        Q. I would like you to flip to Exhibit 3, if you  
16          would.

17        A. Remind me which one that was.

18        Q. It's the drought reconstruction for the  
19          Continental United States is the title of that  
20          exhibit. It's the yellow tab I think in the  
21          white notebook.

22        A. (Witness reviews documents). All right.

23        Q. I want you to start by flipping to the first  
24          page of that particular exhibit.

25        A. All right.

1 Q. Now, in the introduction it's identified as  
2 several droughts; is that correct, that have  
3 occurred in the continental United States?

4 A. Yes.

5 Q. And it indicates, for example, a drought in  
6 Texas. Is that right?

7 A. You are referring to 1950s in Texas?

8 Q. Yes.

9 A. Yes.

10 Q. And then it talks about at the end of that  
11 opening paragraph it says: In the 1930s in the  
12 northern Great Plains; is that right? Is that  
13 what it states?

14 A. Yes.

15 Q. So, in other words, is what this article is  
16 saying that the 1930s drought mainly affected  
17 the northern Great Plains, is that what this is  
18 saying?

19 A. I don't think it says that.

20 Q. What is meant by northern Great Plains in this  
21 article then?

22 A. It says in the 1930s in the northern Great  
23 Plains, but it doesn't actually talk about the  
24 rest of the Great Plains.

25 Q. Well, my question I guess is then, is it true

1           that that drought was more severe in the  
2           northern Great Plains than it was in the  
3           southern Great Plains?  Would that be a true  
4           statement?

5   A.    I don't know if it's true, it could be implied  
6           from this.

7   Q.    And as you are sitting here today you don't have  
8           knowledge on that particular subject?

9   A.    I know the droughts of the '30s and '50s  
10          affected different parts of Kansas differently.

11   Q.    I want to flip to actually 1147, Page 1147 of  
12          that article.

13   A.    Yes.

14   Q.    Now, on 1147 there is a map; is that right?

15   A.    Yes.

16   Q.    And that shows tree ring analysis that's  
17          occurred; is that right?

18   A.    Yes.

19   Q.    Now, just so I am clear, the points on that  
20          particular map show where tree ring analysis  
21          occurred, is that a true statement?

22   A.    Yes.

23   Q.    Now, is it also a true statement there is no  
24          points for the tree ring analysis that occurred  
25          in Kansas?  Would that be a true statement?

1 A. On that map, correct.

2 Q. Now, let's go to the PDSI grid on the previous  
3 page for drought reconstructions. You said that  
4 there were six points for Kansas?

5 A. Yes.

6 Q. And there is three points that would be in the  
7 northern half of Kansas, is that a true  
8 statement?

9 A. Yes.

10 Q. And then there are three points that would be on  
11 the extreme southern border of Kansas, is that a  
12 true statement?

13 A. In this picture, that's correct.

14 Q. Now, you indicate that your analysis is based  
15 off of that extreme point in the southwest  
16 portion of Kansas. I just want to make sure I  
17 understand your testimony.

18 A. Deciding which years to use for the 1%, 2%  
19 droughts were based on that, the point in the  
20 southwest corner of Kansas, yes.

21 Q. And I guess I am unclear, once again, why you  
22 decided to selectively choose that area for your  
23 drought reconstruction.

24 A. I was retained to create, or create or revise an  
25 updated model for the City of Wichita. And the

1 inputs for the Equus Bed aquifer portion of that  
2 come from a USGS MODFLOW model, which is much  
3 better representing what goes on in the aquifer.  
4 In the MODFLOW model it is represented fairly  
5 simplistic. Which means most of the MODFLOW  
6 model relies on stream flow. The gauge stream  
7 flow record we have, that affects the Wichita  
8 area, is best correlated, in other words, it's  
9 best reproduced, by the data that comes from the  
10 southwest corner of Kansas than any of the  
11 surrounding dots.

12 Q. Now, just so I am clear though, isn't there a  
13 difference between stream flow variability in  
14 western Kansas as opposed to eastern Kansas,  
15 there would be differences in the stream flow in  
16 those regions; is that correct?

17 A. Yes.

18 Q. And wouldn't that change some of the analysis,  
19 if you are trying to apply stream flow data in  
20 western Kansas, to let's say eastern Kansas,  
21 that would change the analysis, would it not?

22 A. So as we talked about, we looked at finding the  
23 best fit to the PDSI data we have with the  
24 historical stream flow record. So that when we  
25 went back in time and used the part of PDSI data

1 we could not confirm, because there is no  
2 historical gauge record, we would be as certain  
3 as we could be it was the best representation.  
4 So stream flow around the Wichita area is most  
5 reflected by the PDSI data in southwest Kansas.  
6 Is it identical, no? I mean, they are not  
7 identical things. But it is the best  
8 representation statistically, it is the best  
9 representation we have.

10 Q. Has development over the years in areas such as  
11 where the rivers are in western Kansas, has  
12 development impacted the analysis with regard to  
13 the drought calculations?

14 A. I don't think it's the answer you are looking  
15 for, but the answer to your question is no.

16 Q. So, in other words, you are saying that if we go  
17 back to the 1920s and there is no irrigation in  
18 western Kansas and then we fast forward and  
19 there is a bunch of irrigation, for example, in  
20 western Kansas, you are telling us, and those  
21 pivots are right by the river, you are saying  
22 that's not going to impact the analysis?

23 A. That's not what I said. I answered your  
24 question.

25 Q. So if we take development to mean, for example,

1 the drilling of water wells, does that impact  
2 the analysis?

3 A. The analysis of PDSI?

4 Q. Yes.

5 A. No.

6 Q. Does it impact the analysis that you did?

7 A. In some ways, certainly.

8 Q. And tell me how.

9 A. Development of upstream water is going to  
10 change, development of upstream groundwater will  
11 likely change the timing and amount of water  
12 passes stream flow gauges down here to Wichita.  
13 And that can either decrease flows, at certain  
14 times of the year; or for your example was, you  
15 put a well in with a pivot and you irrigate, it  
16 could also increase flows at other times of the  
17 years due to return flows.

18 Q. Let's go ahead and flip to Exhibit 4. And  
19 that's the document that was titled Northern  
20 American Drought Reconstructions.

21 A. By Cook?

22 Q. By Cook. I believe you said, and I want to make  
23 sure I heard your testimony correctly. I think  
24 you said that sudden precipitation would not be,  
25 could not accurately be accounted for in all

1 events; is that correct? Is that what you glean  
2 from this article?

3 A. May not be, yes.

4 Q. And, in fact, could sudden precipitation events,  
5 as we apply that to the Palmer Drought Severity  
6 Index, could that skew some of the results of  
7 the analysis?

8 A. Yes.

9 Q. I think you also said that as you analyzed this  
10 particular article there is a bias toward the  
11 severity of a drought occurring. Is that what  
12 you said?

13 A. I don't believe that was in this article, no.

14 Q. Let's flip to Exhibit 5 then. Let's flip to  
15 Page 3 of Exhibit 5.

16 A. These notebooks aren't tabbed by Exhibit Number.  
17 Can you tell me what that is.

18 Q. Yes. It's a A Thousand Years of Drought and  
19 Climatic Variability in Kansas under Exhibit 5,  
20 I believe.

21 A. (Witness reviews documents). 2012 by Anthony  
22 Layzell?

23 Q. Yes.

24 A. All right.

25 Q. I ask that you flip to Page 3.

1 A. All right.

2 Q. You analyzed some of the data in Division 7 and  
3 you spoke to that in southwest Kansas. Is that  
4 true? You spoke to that in your testimony?

5 A. Yes.

6 Q. My question is, with respect to that data in  
7 southwest Kansas, does that take into account  
8 the stream flow when the river would run dry?

9 A. So my use was purely on historical records. So  
10 if there were dry periods in that record, yes.

11 Q. I am just going to ask you a few general  
12 questions about tree ring chronology. With  
13 respect to tree rings, would it be a true  
14 statement that at best to try and predict a  
15 drought based on tree rings these are  
16 guesstimates; is that right?

17 A. Well, they are calculated numbers. There is  
18 certainly room for both natural and mechanical  
19 processing errors or biases, yes.

20 Q. So, in other words, with respect to a tree ring  
21 analysis, it's not the same as measuring a water  
22 gauge or something of that nature; is that  
23 correct?

24 A. Well, I don't know that I would say that.  
25 Measuring a water gauge is also, in your words,

1 a guesstimate. It's not a precise science.

2 Q. I understand that. But would you also  
3 acknowledge that trying to analyze tree rings  
4 from like the 1600s would not be as precise  
5 science as measuring, for example, current well  
6 data. Would that be a true statement?

7 A. Well data, that would be a true statement.

8 Q. And, in fact, if you look at some of the  
9 articles that you quoted that talk about tree  
10 rings it says that the data suggests, over and  
11 over in the articles. Would that be an accurate  
12 statement to indicate that these are just  
13 suggestions, they are approximations of what we  
14 can speculate from the tree rings, is that what  
15 that means?

16 A. They are approximations, yes.

17 Q. Now, you mentioned that in the 1880s the  
18 measurements that they took to try and measure  
19 drought and water, at that point, that the data  
20 was pretty variable, is that true?

21 A. When you say variable, what do you mean?

22 Q. Limited. It was limited; is that correct?

23 A. It is limited.

24 Q. And, in fact, even in the 1920s when we are  
25 talking into account stream flows, the data way

1 back then was fairly limited, is that true?

2 A. Yes.

3 Q. And with respect to the 1940s would you also  
4 agree that the data used in the 1940s would not  
5 be as good as the measurements and the data we  
6 have today?

7 A. That is likely true.

8 Q. Now, so with respect to trying to predict a  
9 drought that occurred in the 1600s, for example,  
10 would you agree that trying to make a prediction  
11 in that regard is purely speculative in nature?

12 A. No. I would say it's not speculative.

13 Q. But it's based on best guesses and  
14 approximations; is that correct?

15 A. I would not agree with the word guess, I would  
16 with the word approximation.

17 Q. But in other words, our ability to predict a  
18 drought prior to the early 1900s is not as good  
19 as our data to suggest a drought today; is that  
20 right?

21 A. I don't know if that's true.

22 Q. What do you mean by that?

23 A. So when you say our ability to predict a  
24 drought.

25 Q. I am sorry. Our measurement of droughts in the

1 last 20 years, I am sorry I will rephrase. Our  
2 measurements of droughts in the last 20 years  
3 are better than measurements in the 1900s, is  
4 that true?

5 A. I certainly think we have the ability to measure  
6 more aspects of a drought. In other words, back  
7 in the 1800s the primary use of water was for  
8 agriculture and for domestic water supply, which  
9 was individual hand dug wells. And today we can  
10 measure that in much more nuanced ways. We look  
11 at stream flow, we look for environmental  
12 affects, we look for wastewater return flows, we  
13 look for minimum flows, we look for compact  
14 requirements. We have much more data today than  
15 we did.

16 Q. I am going to ask that you flip to Exhibit 6.  
17 Which was titled 2000 Years of Drought  
18 Variability. And it's a blue tab.

19 A. I am there.

20 Q. I am asking that you flip to the second page of  
21 that document.

22 A. (Witness reviews documents). All right.

23 Q. Now, on the second half of that document it  
24 mentions that due to the scarcity of records he  
25 was unable to make a full assessment of a

1 drought in 1860. Do you see where I am reading  
2 in that particular document?

3 A. Two or three sentences down, the italicized  
4 part?

5 Q. Yes.

6 A. Yes.

7 Q. So would it be an accurate statement that the  
8 records were scarce in that time period?

9 A. Scarce, yes.

10 Q. Now, just a moment ago Mr. McLeod asked you a  
11 question about whether or not you made a  
12 recommendation as to the amount of water that  
13 should be put in storage. And you said you  
14 didn't remember what that recommendation was; is  
15 that correct?

16 A. That's correct.

17 Q. And as you are sitting here now, would it be a  
18 true statement that you still don't have a  
19 recollection of what that recommendation is?

20 A. I don't have a good recollection, no.

21 Q. As you are sitting here today you are not  
22 prepared to testify on that particular aspect of  
23 the City's planning; is that right?

24 A. As I am sitting here right now, that's correct.

25 Q. In Exhibit 7, and I just want to understand, it

1 was an Environmental Impact Statement, and you  
2 talked a little bit about the RESNET model as it  
3 related to that particular report. As you are  
4 sitting here today, do you have any knowledge as  
5 far as whether or not that Environmental Impact  
6 Statement took into account the concept of  
7 aquifer maintenance credits? Do you have an  
8 opinion on that?

9 A. I know the RESNET model certainly calculated the  
10 aquifer storage. I do not recall whether they  
11 specifically used credits.

12 Q. Fair enough. Do you have any idea of whether or  
13 not that particular document, that Environmental  
14 Impact Statement, took into account the proposed  
15 minimum index levels that have been proposed by  
16 the City here today?

17 A. The ones proposed today, no, I did not. Well, I  
18 mean define minimum, dead rock bottom, yes. The  
19 revised pumping levels, no, I do not believe it  
20 did.

21 Q. And I want to make sure I understand what you  
22 were saying about the RESNET model. You said  
23 that there were problems with the RESNET model I  
24 think because it's difficult to change some of  
25 the variables and it's not very user friendly

1 for that reason; is that right?

2 A. Yes.

3 Q. But didn't you also say that the MODSIM model,  
4 MODSIM DSS model, is based off of RESNET?

5 A. It's the other way around. RESNET was based off  
6 MODSIM. MODSIM has continued to be developed.  
7 RESNET stopped, MODSIM is continuing to be  
8 developed through today. So its interphase is  
9 much more robust.

10 Q. So what you are saying is that the RESNET model  
11 is more archaic than the MODSIM DSS model, would  
12 that be a true statement?

13 A. The user interphase is much more archaic.

14 Q. I heard you say something about concerns that  
15 the City of Wichita had with respect to plumbing  
16 issues in the city. Can you tell me what you  
17 meant by that.

18 A. So when we put the, as built pipeline  
19 capacities, in from both Equus Beds aquifer and  
20 from Cheney Reservoir, to the water treatment  
21 plant, there was some places where between  
22 valving and physical bifurcations where the  
23 system had, under certain hydraulic heads, had  
24 performance issues where it could not, it was  
25 designed to be a 65 MGD pipeline, and for

1 example, if the Cheney Reservoir was low they  
2 could not get 65 MGD through the pipeline.

3 Q. Now can that infrastructure be improved by the  
4 City?

5 A. Yes. And I believe it has been. The issues we  
6 identified at the time.

7 Q. And how do you know that that infrastructure was  
8 approved?

9 A. Because when we identified it they said, oh, we  
10 have plans in place, we have budget allocated to  
11 modify those things.

12 Q. And who told you that specifically?

13 A. My recollection would be it would be Deb Aoy  
14 with the City of Wichita, who was my main  
15 contact at the time. That is spelled A-O-Y.

16 Q. I think you also indicated you trained two  
17 individuals at the City with the MODSIM DSS  
18 model, is that a true statement?

19 A. Yes.

20 Q. Which two individuals did you train?

21 A. So Deb Aoy and, and I am drawing a blank on the  
22 second name. I am sorry. It will come to me in  
23 a few minutes.

24 Q. Are there any documents that would refresh your  
25 memory in that regard?

1 A. Not in front of me here.

2 Q. So as you are sitting here today, the only  
3 individual that you can remember is Deb Aoy?

4 A. I am sorry, Mike Jacobs.

5 Q. Did you train anybody else on the MODSIM DSS  
6 model?

7 A. As staffing changed at the City of Wichita I  
8 also worked quite extensively with Scott Macey.

9 Q. Anybody else?

10 A. Not for extended training, no.

11 Q. One thing you mentioned about the analysis you  
12 did, you indicated that essentially for the 1%  
13 drought conditions you looked at ten years; is  
14 that right?

15 A. Yes.

16 Q. You, in fact, just ran the model for that ten  
17 years; is that right?

18 A. Yes. The model, the period of record would be  
19 eight years, but we put two normal, what we  
20 consider average years in front of the model, so  
21 that when you run it you have to make  
22 assumptions by reservoir elevations, aquifer  
23 elevations. And we ran it for two years with  
24 average conditions to let the model equal out  
25 and come to an equilibrium before we hit it with

1 a drought.

2 Q. Do you think it would be good analysis in the  
3 future to analyze some other periods of time and  
4 see what kind of results you get for those other  
5 periods of time?

6 A. We did that when we first converted the model.  
7 We took the model, it was designed for a future  
8 condition, larger demands, additional pipelines,  
9 things like that. Converted it from RESNET to  
10 MODSIM, trimmed it down to the existing system  
11 and ran the full period from the '30s to the  
12 present. And we looked at both as, for example,  
13 the pipeline changes, how that would be  
14 affected. So we did that.

15 Q. And what did you learn from having done that?

16 A. Certainly the most critical period was the 1930s  
17 for the City of Wichita system.

18 Q. What were the average conditions that you  
19 accounted for?

20 A. I would have to go back and look. We picked a  
21 certain year, we looked at stream flow,  
22 reservoir contents, things like that and picked  
23 one that we thought was representative of all of  
24 those things.

25 Q. What variables did you take into account?

1 A. Besides the ones I just mentioned, I don't  
2 recall anything other than that.

3 Q. You mentioned just a minute ago that the Little  
4 Arkansas River contributes to the aquifer  
5 everywhere that it flows, I think was your  
6 statement from your earlier testimony; is that  
7 correct?

8 A. I am sorry, repeat that.

9 Q. I think you said in your earlier testimony that  
10 the Little Arkansas River contributes to the  
11 aquifer at every location where it flows. Was  
12 that a true statement from your earlier  
13 testimony?

14 A. I think you may have that, well, one of us is  
15 remembering something wrong or differently.  
16 (Witness reviews documents).

17 Q. I guess my question is, does the aquifer  
18 contribute to the Little Arkansas River or does  
19 the Little Arkansas River contribute to the  
20 aquifer?

21 A. That's what I want to check before I answer your  
22 question.

23 Q. Okay.

24 A. (Witness reviews documents). So back to the  
25 technical memo we did in 2013, we did some

1 graphs of how RESNET interacted with both the  
2 Little Arkansas and the Big Arkansas River. And  
3 from that, the Little Arkansas Equus Beds flows  
4 to the Little Arkansas River at both locations,  
5 so, yes.

6 Q. Okay. And I guess my question is, how did you  
7 take that into account in your modeling?

8 A. So in MODSIM model we simulate the Equus Beds  
9 aquifer physically as a giant reservoir with no  
10 evaporation on it. And depending on the  
11 elevation in the aquifer, there are equations  
12 that dictate how fast the water leaks in to the  
13 Little Arkansas River. So when the aquifer is  
14 very high it leaks at a faster rate to the  
15 reservoir than when the aquifer is low. And  
16 then we have a series of equations that says  
17 what's the elevation in the groundwater. And  
18 then we apply what we believe is the correct  
19 equation to say there is a lot of leakage, not  
20 much leakage. So as the model simulates the  
21 reservoir going up and down, the actual loss  
22 changes. It is responsive to the elevation in  
23 the aquifer.

24 Q. As you analyzed the variability within the  
25 aquifer and whether or not it can take on

1 recharge? Did you analyze anything like that,  
2 whether or not the aquifer itself, how fast it  
3 would recharge naturally?

4 A. No. In the RESNET model there is a flat  
5 recharge rate and we just used that.

6 Q. So you used a flat recharge rate for the Equus  
7 Beds aquifer. Would that same flat recharge  
8 rate be used, for example, in the Ogallala in  
9 western Kansas? Would you use that same rate?

10 A. Unlikely.

11 Q. Tell me what you mean by that.

12 A. Well, the recharge rate we used was 3.2 inches a  
13 year. So if you happen to be in the area of the  
14 Ogallala that had 3.2 inches of infiltration, it  
15 might; but it would be but unlikely.

16 Q. How did you come up with the number of 3.2?

17 A. That came from the RESNET model. The  
18 documentation in the RESNET model said that was  
19 provided by the USGS.

20 Q. Now tell me what it means when you said that the  
21 drought in the 1930s to 1940s was worse than a  
22 basic 1% drought. Tell me what that means.

23 A. When we calculated the 1% drought based on the  
24 PDSI data, first of all we looked at the length  
25 of the drought and we said a 1% drought would

1 have a length of eight years. And then we went  
2 through the historical years where we have gauge  
3 data, and we said what droughts do we have that  
4 are eight years long? And if we look at the  
5 cumulative shortage over that period, how well  
6 does that match? And for the 1% drought of the  
7 1930s, it was pretty close, like you said, minus  
8 22 compared to minus 24. The practical affect  
9 of that is that the 1930s drought is strictly,  
10 from an engineering basis, is slightly more  
11 severe over those eight years, and the drought  
12 that we calculated.

13 As a practical affect, well, we never  
14 really know the difference, but I think as a  
15 practical affect. It's much more defensible to  
16 use the drought of the 1930s, which is a  
17 historical period, than to get to go cherry pick  
18 years that match the drought, the cumulative  
19 deficit exactly.

20 Q. Now, you just mentioned cherry picking years. I  
21 would like now to flip to Exhibit 1. Which was  
22 the proposal itself. And I ask that you turn to  
23 2-2. Page 2-2 of the proposal.

24 A. (Witness reviews documents). All right.

25 Q. Now, looking at 2-2, for example, let's look at,

1 let's look at a seven year drought in that  
2 table. And the years that it uses is 1946, 1952  
3 to 1956 and then again 1981. Would it be an  
4 accurate statement to say that in calculating  
5 these particular droughts that they were cherry  
6 picked years?

7 A. Those years were picked first for the longest  
8 period of record, less than seven years, had the  
9 highest PDSI, so '52 through '56. And then the  
10 next closest years in order that would get us  
11 close to that number. So, yes, I picked those  
12 years, but there was logic to it in that 1946  
13 comes before, we start with the '52 to '56  
14 period. And '46 was the closest prior year,  
15 prior to that period. And 1981 was the next  
16 year after to come up with the cumulative PDSI  
17 that was, in this case, the same as the  
18 calculated PDSI.

19 Q. So based on which years you choose that could  
20 change the calculations drastically; is that  
21 correct?

22 A. It certainly would change them. I don't know  
23 that I would say drastically. Yes, which four  
24 years you choose makes a difference.

25 Q. Now, did you analyze the years 2011 and 2012,

1 did you analyze those particular years?

2 A. I did not. This work was done before then.

3 Q. What did you say? I am sorry.

4 A. I did not. My work that was reported in these  
5 reports was before then.

6 Q. So any analysis as it relates to 2011 and 2012,  
7 you wouldn't have an opinion on?

8 A. So Scott Macey at the City did that work and he  
9 had me review it. I did not do it. I do have  
10 an opinion on it.

11 Q. Okay. So I think you kind of answered this  
12 before, the reason you plan for a 1% drought is  
13 because if you plan for a drought that's more  
14 severe it would be, it wouldn't be cost  
15 effective, is that what you said?

16 A. Broadly speaking, yes.

17 Q. Do other cities generally plan for a 1% drought?  
18 Is that common from your experience?

19 A. It is very common from my experience.

20 Q. Do some cities, in your experience, plan for  
21 lesser droughts?

22 A. Some cities don't plan at all. So I guess the  
23 answer is yes.

24 Q. Did you model any other type of drought as it  
25 relates to the City's proposal? For example, a

1           2% drought?

2       A.   Well, certainly within the period of record we  
3           did.  So all lower droughts that were in the  
4           period of record within the RESNET model, we  
5           included those.  We run the whole period of  
6           record and there were little droughts within  
7           that.  So, yes, we modeled those.  We looked at  
8           those and said those are not the primary  
9           interest of the city, they either have the  
10          existing resources to get through those or maybe  
11          we should worry about the big ones at the end.

12       Q.   If you were to model for just the 2% drought,  
13          what impact would that have for the Equus Beds  
14          aquifer and for Cheney, how would that be  
15          different from the 1% drought?

16       A.   I don't recall that off the top of my head, but  
17          I suppose the answer is, they would get drawn  
18          down less.

19       Q.   Now, in the City's proposal they calculate a 1%  
20          drought based on eight years, is that a true  
21          statement?

22       A.   Yes.

23       Q.   Is there a different period of time that could  
24          be used to calculate a 1% drought, either more  
25          or less than eight years?

1 A. Not by the methodology I used. A 1% drought has  
2 a period of record of eight years.

3 Q. Under other methodologies, can you use a lesser  
4 period to calculate a 1% drought?

5 A. I believe there are methodologies that would use  
6 that, I am not sure that they would be industry  
7 standard methods.

8 Q. Is there such a thing as a normal or average 1%  
9 drought?

10 A. Not to my knowledge.

11 Q. So, in other words, it's difficult to  
12 approximate what a 1% drought would look like,  
13 is that a true statement?

14 A. You could arrive at it mathematically, I am not  
15 sure it would be meaningful.

16 Q. So just to answer my question before, and I am  
17 circling back to it, a 1% drought doesn't have  
18 to be eight years, is that a true statement?

19 A. That's true.

20 Q. If we used a shorter time period to calculate a  
21 1% drought, let's say six or seven years, what  
22 would be the impact to Cheney and the Equus Beds  
23 aquifer? Or do you have an opinion on that as  
24 you are sitting here today?

25 A. So by my methodology, which has been used in

1 other municipalities, it's not for Wichita's  
2 state only, for this area, the 1% drought is  
3 defined as being eight years long. If you made  
4 a drought that was shorter it would no longer be  
5 a 1% drought.

6 Q. Could future data change that analysis? In  
7 other words, if we had drought events in the  
8 future that were different than the 1930s and  
9 1940s, could that change your analysis of what  
10 constitutes a 1% drought?

11 A. Yes.

12 Q. Now, I want to back up just a moment. In your  
13 expert report you highlighted three parts of the  
14 City's proposal that you had expertise on. And  
15 I want to go over those. The first was section  
16 2.1; is that correct?

17 A. (Witness reviews documents). I am sorry quote  
18 that again.

19 Q. In your amended report that was filed there are  
20 three sections of the report that you believed  
21 you had expertise on and the first section was  
22 2.1. Is that correct?

23 A. Do you have the page number for that?

24 Q. I am not sure where it is there within your  
25 exhibits.

1 MR. STUCKY: May I approach the  
2 witness?

3 THE HEARING OFFICER: Yes.

4 BY MR. STUCKY:

5 Q. Right here (indicating).

6 A. Okay.

7 Q. If I were to tell you that that is, in fact,  
8 your amended expert report, would you agree with  
9 that statement?

10 A. It appears to be, yes.

11 Q. Now, in that particular expert report there are  
12 several sections that I have in boxes that you  
13 had expertise on; is that correct?

14 A. Yes.

15 Q. And the first section was 2.1; is that right?

16 A. Yes.

17 Q. So there are several bullet points under section  
18 2.1; is that correct?

19 A. Yes.

20 Q. Now, the next part of the expert report that you  
21 indicate that you have expertise on, I am sorry,  
22 of the City's proposal that you have expertise  
23 on is section 2.3; is that right?

24 A. Yes.

25 Q. And would it be a true statement that actually

1           there is not any other portion of the City's  
2           proposal that you indicated that you had  
3           expertise on, is that true? In your expert  
4           report at least.

5       A.    These are the parts that I was asked to testify  
6           on.

7       Q.    So that would be a true statement, correct?

8       A.    For the purposes of this hearing, that would be  
9           true.

10      Q.    And so at least as it relates to your expert  
11           report, you weren't asked to serve as an expert  
12           witness on any other portion of the report, is  
13           that true?

14      A.    Unless it was those other opinions that relied  
15           somehow on my work.

16      Q.    Otherwise that statement would be true, correct?

17      A.    Otherwise that statement would be true.

18      Q.    All right. Let's jump back to some of the  
19           variables that were used in calculating a 1%  
20           drought scenario. Did you take into account the  
21           concept of multiyear flex accounts in your  
22           analysis?

23      A.    No.

24      Q.    And why not?

25      A.    Because it was not necessary for my work.

1 Q. And if multiyear flex accounts were being used  
2 in the Equus Beds Groundwater Management  
3 District -- well, let me ask. Do you know what  
4 a multiyear flex account is?

5 A. I have heard them discussed, I have not been  
6 asked to look in to them or analyze them in any  
7 way.

8 Q. Fair enough. What source is the groundwater  
9 accounted for in your simulation? Or did it  
10 just assume that the groundwater was accumulated  
11 in a constant fashion like you testified to?

12 A. There were three types. The first was a steady  
13 state infiltration 3.2 inches every year. The  
14 second was on the Big Arkansas River where when  
15 the stream and aquifer levels are right, the  
16 river itself can contribute water to the  
17 aquifer. And then the biggest one was ASR  
18 pumping, where we put ASR water, when available,  
19 in the Little Arkansas River in the aquifer for  
20 later use by the City.

21 Q. Now, I ask that you flip to Page 2.5 of the  
22 proposal, and it's table 2.3.

23 A. (Witness reviews documents). This is the MODSIM  
24 result for the 1% drought.

25 Q. Now, with respect to those MODSIM results there

1 is numbers and percentages that have to do with  
2 Cheney Reservoir; is that correct?

3 A. Yes.

4 Q. Now, is it true that with respect to those  
5 calculations, if we look at drought year one  
6 with respect to Cheney Reservoir, it  
7 demonstrates that, it's indicated that the  
8 Cheney Reservoir would be 110 percent full; is  
9 that correct?

10 A. That's what the table says, yes.

11 Q. So would it be an accurate statement that at  
12 least for year one of the drought it was assumed  
13 that the Cheney Reservoir was 110 percent full?

14 A. This table was not prepared by me. And in  
15 talking with people I understand there is nuance  
16 here that I am not able to discuss.

17 Q. So as far as why, so just so I am clear, since  
18 this table wasn't prepared by you and if I were  
19 to ask some very detailed questions as to how  
20 these numbers were calculated and accounted for,  
21 you wouldn't have an opinion on that; is that  
22 correct?

23 A. That's correct.

24 Q. And so just to back up, a moment ago Mr. McLeod  
25 asked you a question if you agreed with

1 everything in section 2.3 of the model. Do you  
2 remember that question?

3 A. Yes.

4 Q. And you said the answer was yes, but as we are  
5 sitting here now, it's a true statement to say  
6 that you actually don't have an opinion on table  
7 2.3; is that correct?

8 A. I was not asked to prepare an opinion on table  
9 2.3; that is correct.

10 Q. So would it be fair to revise your answer to  
11 exclude any kind of analysis or opinion on that  
12 particular table?

13 A. I don't know if exclude is quite the right word.  
14 I reviewed all the work in some form or another.  
15 When you ask particular questions about  
16 particular details I am not prepared to provide  
17 those answers. And while I reviewed them I am  
18 not the originator of that work. So I may have  
19 an opinion about it, but not as far as this  
20 proceeding.

21 Q. Okay. But as you are sitting here today, you  
22 can't say, with your credentials on the line,  
23 your expertise on the line, that all the numbers  
24 in 2.3 are accurate. Would that be a true  
25 statement?

1 A. I would say there are better people to answer  
2 that question. Yes.

3 Q. Now, I just have a few questions about the 1930  
4 to 1940 years that were used for some of the  
5 model runs. I am going to ask a little bit  
6 about that. Would the stream flow data and the  
7 precipitation data, evaporation data, things of  
8 that nature, be taken into account in those  
9 years?

10 A. When you say, well, by whom? Taken into account  
11 by whom?

12 Q. By the individuals that were measuring the data  
13 in the 1930s and 1940s. Were those variables  
14 taken into account with the measurements?

15 A. The measurements would reflect those things,  
16 yes.

17 Q. And so would there be, and I think you already  
18 answered this. There is better data today for  
19 that, for like the years 2011 and 2012, there  
20 would be better data in that regard; is that  
21 correct?

22 A. We certainly have more data. There is also  
23 gauge stations where the data may not be better,  
24 may be less accurate than it was even then.

25 Q. Would it have been a good idea to use other

1 software, other software to double check some of  
2 the City's work with respect to calculating a 1%  
3 drought?

4 A. When you say calculate a 1% drought, do you mean  
5 which years to use in a 1% drought or do you  
6 mean calculate the results on the City's system?  
7 How a 1% drought would interact with the City's  
8 system?

9 Q. To calculate the results of how it would impact  
10 the City's system.

11 A. There are certainly other modeling packages out  
12 there. In my professional opinion, the MODSIM  
13 model, while it has its limitations, it is the  
14 best software to do this job.

15 Q. All things being equal though, would it be a  
16 good idea to run some of these calculations on  
17 another model as well and see what the results  
18 are?

19 A. Well, we did. I mean, we ran it on the RESNET  
20 model, and took the results and replicated it,  
21 so it's been done twice.

22 Q. Would it be good to try it on additional models  
23 in the future?

24 A. If you can find a better model, that would be  
25 great.

1 Q. Do you have any opinion on whether or not  
2 replicating the 2011 and 2012 data over eight  
3 years is a good way to calculate a drought for  
4 planning purposes?

5 A. I do.

6 Q. What is your opinion in that regard?

7 A. So if we back up and look at, for example, the  
8 1930s, that's the 1% drought, I chose those  
9 years because they happened historically. That  
10 was a natural trace. So any influences by long  
11 term weather or climate, sun spots, whatever, we  
12 are taking that into account. Statistically you  
13 can take any eight years that added up to the  
14 cumulative PDSI being the same and run them.  
15 And there are whole areas of water resources  
16 modeling where you just do that.

17 It's called Monte Carlo simulations and  
18 you pick years of random and run them over and  
19 over and over to see if the order or the number  
20 makes a difference in the answer you get. And,  
21 in fact, the work you do for Aurora we have done  
22 just that. We have done something like 10,000  
23 simulations. I chose the 1930s because it was  
24 an historical period.

25 If you just took two years of a drought

1 and say, okay, we'll plunk this down and we will  
2 repeat it like a two year drought and we know a  
3 1% drought is eight years long, and run it four  
4 years in a row you would have no idea if that  
5 represents a 1% drought. But in this case we  
6 know that it does because we look at not only  
7 the duration, but the cumulative depth of  
8 drought.

9 And conveniently, when you take eight  
10 years for periods of the 2011 and 2012 drought,  
11 the cumulative PDSI deficit is the same, they  
12 are approximately the same, as what was  
13 calculated in the '30s. So when I first saw  
14 that that's something that wanted to be done, I  
15 was pretty skeptical and then said, oh, well,  
16 that checks out. So, yes, I believe that 2011  
17 and 2012 is a reasonable approximation of a 1%  
18 drought considering there are thousands of  
19 possible droughts and we have now looked at two.

20 Q. I know you already indicated that this was  
21 outside of the scope of the expertise that you  
22 were sought for, but could you flip to Page 2-9  
23 of the City's expert report.

24 A. Yes.

25 Q. Now, in that top paragraph at the very end it

1           says, there is a sentence that says, based on  
2           this comparison the years 2011 and 2012 were  
3           selected to repeat four times for a total of  
4           eight years to simulate a 1% drought. Do you  
5           see where in the proposal I am reading?

6           A. Yes.

7           Q. And in the very next sentence says, this  
8           approach results in a total seasonal cumulative  
9           PDSI, Palmer Drought Severity Index, of -23.45  
10          with a mean PDSI of -2.93?

11          A. Yes.

12          Q. Would it be a true statement that replicating  
13          2011 and 2012 four times to come up with the  
14          eight year drought would it be a true statement  
15          to say that that Palmer Drought Severity Index  
16          was more severe than the 1930s to 1940 drought?

17          A. Off the top of my head I don't remember what  
18          those numbers were. But if that number, if the  
19          PDSI -23.4 is a greater negative number than the  
20          one that was calculated for the 1% drought, it  
21          could be more severe, yes.

22          Q. Let's look at the bottom of that table, table  
23          2-4. It says 1933 to 1940 cumulative, and there  
24          are some numbers indicated there. Do you see  
25          those PDSI numbers? Second column from the

1 bottom of that table.

2 A. You mean in a row?

3 Q. Yes, table 2-4 on that same page.

4 A. Yes.

5 Q. At the very bottom if you go up two rows.

6 A. Yes.

7 Q. It says 1933 to 1940 cumulative?

8 A. Yes.

9 Q. Would you agree that at least with what that  
10 data shows is that the 2011 and 2012 replicated  
11 over four years created a more severe drought  
12 than the one of the 1930s to 1940s?

13 A. Mathematically speaking, that's correct.

14 MR. STUCKY: No further questions.

15 THE HEARING OFFICER: We are now at  
16 12:30. Would the parties like to continue on  
17 until about one or go ahead and take a lunch  
18 break now?

19 MS. WENDLING: I only have a few  
20 questions, it should be less than 30, if that  
21 matters.

22 THE HEARING OFFICER: That might be  
23 nice to at least wrap up that part of it. So  
24 we'll move on to the Intervenor's cross.

25 CROSS EXAMINATION

1 BY MS. WENDLING:

2 Q. So if I understand what you were tasked with was  
3 to develop a model to help the City of Wichita  
4 look at water availability. Is that what the  
5 MODSIM does?

6 A. I would modify that a little bit to say, take  
7 the City's existing model and put it in a form  
8 that was used to city staff; but, yes, it is to  
9 look at groundwater planning management for the  
10 City of Wichita.

11 Q. And you talked about the correlation from the  
12 little or from the Arkansas River to  
13 southwestern Kansas?

14 A. Yes.

15 Q. Does the same statement apply to the Little  
16 Arkansas River or is that isolated to the  
17 Arkansas River?

18 A. It's both.

19 Q. So both rivers are best correlated to  
20 southwestern Kansas?

21 A. Yes.

22 Q. And you mentioned that your determination that  
23 the drought in the '30s most closely correlated  
24 to the 1% drought that was before you had data  
25 on the 2011 and 2012 drought?

1 A. Yes.

2 Q. Have you looked at that further, now that data  
3 is available from the 2011 and 2012 as well?

4 A. The City did that work. I reviewed it.

5 Q. When you are doing your drought reconstruction  
6 analysis, do you ever use, or are the PDSI  
7 numbers able to tell you when a drought has  
8 ended?

9 A. Can you ask that a slightly different way?

10 Q. Is there an assigned PDSI value for not being in  
11 a drought state?

12 A. Only if you said normal is zero and my  
13 definition of that was plus or minus a half, so  
14 -.5 to +.5, only that the PDSI numbers became  
15 positive again. But, no, there is no defined  
16 time. For example, it has to be a positive  
17 number, a positive number at all or positive  
18 number for two years or three years, no, there  
19 is not. Does that answer your question?

20 Q. So you would not be able to use the PDSI index  
21 for signaling recovery from a drought?

22 A. If by that you mean if an extended drought had a  
23 cumulative deficit would you have to wait until  
24 you saw the deficit recover until you had a  
25 positive values to fill in the previous deficit,

1 I have never seen that done that way. But that  
2 just means I haven't seen it. It doesn't mean  
3 it couldn't be used that way.

4 Q. So in your work with drought reconstruction have  
5 you looked at the time it takes to recover from  
6 a drought?

7 A. No. My work was focused on meeting city demand  
8 through a drought. So once it starts to get  
9 wetter, whether that's through river flows that  
10 contribute to the aquifer or whether that's  
11 through increased storage at Cheney, you know  
12 that you are through the worse of it. I have  
13 not looked at recovery.

14 Q. In your other experience outside of the City of  
15 Wichita, have you looked at recovery?

16 A. It depends on the client. Places like the City  
17 of Steamboat Springs where we just did a model  
18 this year, their storage normally fills every  
19 year. So when we looked at various stressors on  
20 their system, it was, it often did include  
21 recovery; but I wouldn't say that was a criteria  
22 for it.

23 Q. So it is possible to estimate the length of time  
24 it will take to recover from a 1% drought?

25 A. Yes. There would be a lot of assumptions to it,

1 but, yes.

2 Q. Going back to the proposal, I believe Exhibit 1,  
3 on page 2-3, there in the lower half of that  
4 section. Are you on the same page?

5 A. 1% Drought Simulation by MODSIM?

6 Q. Yes.

7 A. Yes.

8 Q. You mentioned that when you were preparing the  
9 model for the City there were certain supplies  
10 that you removed. This is with the conversion  
11 from RESNET to MODSIM. Or is that what you  
12 referred to on the lower half of the Page 2-3 of  
13 the proposal? Are those changes that you made?

14 A. No, the changes I made were more where they had  
15 talked about, for example, expanding the local  
16 well field, so the capacity of that was higher  
17 than they thought would be reasonable to  
18 develop. So we reduced things like that. And I  
19 don't remember all the details of that.

20 Q. So the updates on 2-3 to your knowledge would  
21 have been made by the City?

22 A. I would have to look at each of them thoroughly;  
23 but generally speaking, yes.

24 Q. You mentioned earlier that you have done study  
25 on the Arkansas River, not only for the City but

1           maybe other work. Have you also studied the  
2           Little Arkansas River flow?

3       A.    Only looking at the stream flows to see how they  
4           correlated with the PDSI data.

5       Q.    Does that correlation to stream flows in  
6           southwestern Kansas apply to all the streams,  
7           maybe the basin storage area or central Kansas?  
8           Or is it just the Little Arkansas River and the  
9           Arkansas River?

10      A.    Say that again.

11      Q.    Your correlation of stream flow for purposes of  
12           this, you said correlated best to southwestern  
13           Kansas, is that for Little Arkansas River and  
14           Arkansas River only?

15      A.    So when I -- I will try to answer your question,  
16           I may not do it well. When you go back to the,  
17           say, 1920s there is a limited number of gauges.  
18           And there is one on, if you go far enough, just  
19           one on the Little Arkansas and one on the Big  
20           Arkansas. We took those independently and  
21           correlated them with surrounding PDSI, locations  
22           where PDSI had been calculated. So we did the  
23           north part of Kansas, the north part of  
24           Oklahoma, and the east two thirds of Kansas. So  
25           essentially we started from Wichita and went one

1 dot out in every direction for both the Big  
2 Arkansas and the Little Arkansas River and both  
3 correlated best to the southwest Kansas PDSI. I  
4 don't believe there was data farther up Little  
5 Arkansas with a long enough period of record to  
6 do a correlation. So I think the answer to your  
7 question is no, it did not include the entire  
8 Equus Bed area.

9 Q. Do you recall the distance of the gauge that was  
10 used in terms of making your area?

11 A. So I just took the gauge record itself and then  
12 correlated that to the PDSI data.

13 Q. Okay.

14 A. So it's whatever the gauge represents, whatever  
15 the tributary area of that represents.

16 Q. During the cross examination you were talking  
17 about the data that you ran for the ten-year  
18 period.

19 A. Yes.

20 Q. And you made a comment that you ran it from the  
21 1930s to present.

22 A. Yes.

23 Q. But you also mentioned this was done before the  
24 2011-2012 period?

25 A. That was a fudge, I didn't remember how

1 currently it went through. I believe it was  
2 2008, but I would have to check that.

3 MS. WENDLING: Those are all of my  
4 questions.

5 THE HEARING OFFICER: Mr. McLeod, I  
6 assume you will want to ask some more questions  
7 before your witness is excused; is that right?

8 MR. McLEOD: I have maybe three or four  
9 redirects, very short.

10 THE HEARING OFFICER: Let's go ahead  
11 and do them.

12 REDIRECT EXAMINATION

13 BY MR. McLEOD:

14 Q. Mr. Winchester, one of the critiques that you  
15 were asked about in cross and you responded that  
16 PDSI is not a perfect model. Have you ever  
17 worked with a perfect model?

18 A. I have never worked with a perfect model.

19 Q. If we waited to attempt any science until we had  
20 a perfect model to employ in any undertaking,  
21 how often would we accomplish anything  
22 scientifically?

23 A. Never.

24 Q. And I think during cross you admitted that there  
25 apparently have been critiques of PDSI and that

1           it just relies on the available data. Have you  
2           used models to rely on unavailable data?

3       A.    No, I have not.

4       Q.    And with respect to the series of questions  
5           about your expertise on stream flow in western  
6           Kansas, do you need to have much expertise on  
7           stream flow to know what's downstream?

8       A.    I don't believe so.

9                       MR. McLEOD: That's all.

10                      THE HEARING OFFICER: Does anyone  
11           anticipate at this time any more questions for  
12           Mr. Winchester? Okay. Then I think this would  
13           be a good time for a break. It is 12:40 and  
14           let's try to be back at 1:45. Thank you.

15                      (REPORTER'S NOTE: At this time,  
16           12:40 p.m., a lunch recess was taken, after  
17           which, 1:45 p.m., the following proceedings were  
18           held:)

19                      THE HEARING OFFICER: We are now back  
20           on the record. It is 1:45. And, Mr. McLeod, I  
21           believe it's time for you to continue.

22                      MR. McLEOD: Thank you. The City will  
23           next call Joe Pajor to the stand.

24                                      JOSEPH PAJOR,  
25           was thereupon called as a witness herein, and

1 after having first been duly sworn to testify to  
2 the truth, the whole truth and nothing but the  
3 truth, was examined and testified as follows:

4 DIRECT EXAMINATION

5 BY MR. McLEOD:

6 Q. Please state your name for the record.

7 A. Joseph Pajor.

8 Q. Mr. Pajor, do you hold any degrees from  
9 universities or technical schools?

10 A. Yes, I do.

11 Q. What are they?

12 A. I have a bachelor's degree from Benedictine  
13 College in Atchison, Kansas with a major in  
14 physics and a minor in mathematics. I have a  
15 Master of Science degree from Wichita State  
16 University in physics.

17 Q. Do you maintain any professional licenses or  
18 certifications?

19 A. I have a certification in city management from  
20 the Wichita State University and the  
21 International City and County Manager  
22 Association certificate in public management.

23 Q. Where are you employed?

24 A. City of Wichita, Kansas.

25 Q. How long have you been with the City?

1 A. A little over 44 years.

2 Q. What positions have you held with the City?

3 A. For the last decade I have been the deputy  
4 director of public works and utilities, I spent  
5 one year of that time as the interim director of  
6 the department. Prior to that I held a number  
7 of positions in energy, housing, economic  
8 development, natural resources, solid waste  
9 management.

10 Q. In the course of your work for the City have you  
11 had occasion to deal with water supply issues?

12 A. Yes, I have.

13 Q. Were you involved in the projects ultimately  
14 permitted by the State Division of Water  
15 Resources as the ASR Phase I and Phase II  
16 projects?

17 A. Yes. I became actively involved with the  
18 project during the development of Phase II.

19 Q. Have you also served on the governing board of  
20 Equus Beds Groundwater Management District  
21 Number 2?

22 A. Yes.

23 Q. For how long?

24 A. It's been approximately nine years. I am  
25 currently still on that board.

1 Q. In the course of that service on the district  
2 board, did you participate in the Board's review  
3 and analysis of water rights applications, or  
4 the rights modification applications and related  
5 matters on which the Board made recommendations  
6 to the Division of Water Resources?

7 A. Yes.

8 Q. Did those reviews and analyses typically include  
9 consideration of whether the proposed diversion  
10 or modification would impair any existing rights  
11 and whether they would be consistent with the  
12 public interest?

13 A. Yes, they did.

14 Q. Are you generally familiar with the City of  
15 Wichita's integrative local water supply plan?

16 A. Yes, I am.

17 Q. What's the purpose of such a plan?

18 A. The purpose of integrated water supply plan at a  
19 high level is basically to look at the available  
20 resources for water for the customers of the  
21 utility of the City of Wichita, water and sewer  
22 utility, and to make the best possible use of  
23 those resources to meet that customer demand.

24 Q. If you would please refer to figure 12 in the  
25 proposal, which is in the black binder and has

1           been admitted as Exhibit 1. And I believe that  
2           figure can be found at Page 33 of the proposal.

3       A.   (Witness reviews documents). Okay.

4       Q.   Where is the graphic there drawn from?

5       A.   The graphic is based on the information that's  
6           in the USGS Survey Scientific Investigation  
7           Report 2015-5121.

8       Q.   Is that figure depicting the City's use of  
9           groundwater and surface water sources over a  
10          period of decades from a period of 1938 to 2013?

11      A.   Yes.

12      Q.   What does it show happening in the 1993 to '98  
13          timeframe with respect to the surface water  
14          supply and the use of groundwater supply?

15      A.   From 1993 to '98 the City made a conscious  
16          transition from utilizing a source of supply,  
17          primarily the Equus Beds, to transition that to  
18          be primarily from the surface water supply, the  
19          Cheney Reservoir. So basically taking as much  
20          water as possible from surface water supply and  
21          reducing our dependance on the groundwater  
22          resource in the Equus Beds.

23      Q.   Was that transition a consequence of the  
24          integrated local water supply plan?

25      A.   Yes, it was.

1 Q. Did the implementation of integrated local water  
2 supply plan result in a substantial increase in  
3 the percentage of surface water represents in  
4 the total surface water to meet demands?

5 A. It did. It went from approximately 40 percent  
6 on an annual average basis to 60 percent of our  
7 demand being met with surface water.

8 Q. Please turn to figure 13 on Page 3-4 of the  
9 table.

10 A. Okay.

11 Q. Where was that graphic taken from?

12 A. This graphic has its source the geological, U.S.  
13 Geological Survey Scientific Investigations  
14 Report 2016-5165.

15 Q. And what's this graphic illustrating?

16 A. It is illustrating the groundwater level changes  
17 in the shallow part of the aquifer in and around  
18 the Equus Beds well field that the City of  
19 Wichita operates from the period of 1993 to  
20 2016.

21 Q. What's the trend of those changes as shown in  
22 the graphic?

23 A. The trend is generally significant amounts of  
24 recovery within the City of Wichita's well field  
25 in elevations in elevations of groundwater.

1 Q. If we look back to figure 12 in the proposal, in  
2 that figure does irrigation use look to be  
3 trending above 1993 use from most of that same  
4 1993 to 2016 period?

5 A. Yes, it does appear to be the case from that  
6 data.

7 Q. And in the graphic does groundwater use for  
8 irrigation in drought years, 2011 to 2013,  
9 appear slightly higher than other historical  
10 peak years shown in that graph?

11 A. Yes, it.

12 Q. Does the figure 12 also show that the City's  
13 total use of water for public supply in the  
14 years since 1992 has not demonstrated an  
15 increase from the 1992 quantities?

16 A. Yes.

17 Q. Please turn in the lime binder to the tab marked  
18 Equus water use.

19 A. Okay.

20 MR. McLEOD: I will have the reporter  
21 mark this as Exhibit 8.

22 (City Exhibit 8 was marked for  
23 identification by the Reporter.)

24 BY MR. McLEOD:

25 Q. Mr. Pajor, what is this document that has been

1 marked as Exhibit 8?

2 A. This is a graphic presentation of information on  
3 groundwater use in the central Wichita well  
4 field area, and the rest of the study area  
5 around the well field, including the average  
6 annual precipitation in the study area 1998  
7 through 2015. And it also shows water use data  
8 from the Kansas Geological Survey, the  
9 Department of Kansas Agriculture, participation  
10 data are from the National Oceanic and  
11 Atmospheric Administration weather service.

12 Q. Do you know who produced this graphic?

13 A. I believe it was produced by consultants for the  
14 City of Wichita based on information provided by  
15 others.

16 Q. And would the others be the Kansas Geological  
17 Survey and Kansas Department of Agriculture?

18 A. Yes, that's correct.

19 Q. Is that graph providing a graphical  
20 representation of groundwater use and  
21 precipitation trends from 1988 to 2015 in a  
22 study area of the Equus Beds aquifer that  
23 includes the Wichita well field area?

24 A. That's correct, that's what it does.

25 Q. What are the two lines representing, the black

1 and black dotted lines, on the graph?

2 A. The black dotted lines shows the total  
3 groundwater use inside the central Wichita well  
4 field area. And then underneath that, the solid  
5 black line shows the groundwater municipal use  
6 inside that same area.

7 Q. Does the graphically depicted relationship,  
8 total groundwater use in the central Wichita  
9 well field area and the City's groundwater  
10 municipal use in that area, show that the total  
11 groundwater use in the central Wichita well  
12 field area historically parallels Wichita's  
13 municipal use in that area except in dry  
14 conditions?

15 A. Yes, that's a fair characterization.

16 MR. McLEOD: I will go ahead and offer  
17 this graphic as Exhibit 8.

18 THE HEARING OFFICER: Any objections?

19 MR. STUCKY: I guess we are still  
20 unclear on who created this graphic and how this  
21 graphic was calculated. So I guess we would  
22 like a little more foundation on that. I think  
23 the witness wasn't sure exactly who generated  
24 this graphic.

25 MR. McLEOD: I will come back to it

1 with a later witness.

2 THE HEARING OFFICER: Okay.

3 MR. STUCKY: So no objection subject to  
4 later foundation.

5 THE HEARING OFFICER: Okay. Under  
6 those conditions Exhibit 8 will be admitted.

7 BY MR. McLEOD:

8 Q. Mr. Pajor, when did the City begin recharging  
9 the aquifer via the ASR project?

10 A. The aquifer recharge work began with the  
11 establishment of the Phase I plan, approximately  
12 ten years ago.

13 Q. And do you know the date that the Phase II would  
14 have been placed in service?

15 A. Phase II was placed in service approximately  
16 three years ago.

17 Q. Given the relative volumes of water left in the  
18 aquifer by the City's increased use of surface  
19 water under the integrated local water supply  
20 plan, and the volumes injected by the ASR  
21 recharge, which would be the greater factor in  
22 the post 1993 recovery of water levels in the  
23 aquifer?

24 A. I think clearly the surface water rather than  
25 groundwater would be significant.

1 Q. So compared to the ASR at this point it would be  
2 a more minor component?

3 A. Yes. Yes.

4 Q. Apart from the City's change in management  
5 practices under the integrated local water  
6 supply plan and injection ASR of recharge water,  
7 do you know of any other influence on the  
8 aquifer that would account for the recovery of  
9 water levels that we have seen in figure 13?

10 A. Natural recharge and there is the possibility of  
11 changes in practices by others, but I don't have  
12 information about that.

13 Q. Do you think that the post 1993 groundwater  
14 level recoveries within the well field are  
15 primarily as the result of the implementation of  
16 the integrated local water supply plan and the  
17 City's ASR injection?

18 A. Yes.

19 Q. Did the water level recoveries in the aquifer  
20 pose a problem to the City's use of its ASR  
21 facilities to generate physical recharge  
22 credits?

23 A. Yes, it's created a problem because the concept  
24 of the artificial recharge was that the area  
25 that had been depleted from its predevelopment

1 levels in the vicinity of our well field is the  
2 vacant space in to which we would put the  
3 recharge water. Because of our integrated local  
4 water supply plan, and leaving water that we did  
5 not remove with our native water rights it  
6 results in a much higher aquifer; and,  
7 therefore, little to no room for the recharge of  
8 water from the ASR project.

9 Q. How important is the ability to establish and  
10 recover ASR credits as a component of the City's  
11 plan to meet demand for rural water during an  
12 extended drought?

13 A. The ability to produce and recover ASR credits  
14 is critical to the City of Wichita's 50 year  
15 water supply plan. In non drought conditions we  
16 have sufficient supplies in our native water  
17 rights to meet customer demand throughout the 50  
18 year planning period. However, in terms of  
19 extreme drought conditions and prolonged drought  
20 conditions we'll not have sufficient water to  
21 meet customer demand, and that's where the water  
22 that will be produced by ASR will be utilized to  
23 meet that demand.

24 Q. And while we are on the topic of planning, Mr.  
25 Pajor, who is the decision making authority that

1 decides policy issues for purposes of the City's  
2 drought planning?

3 A. Policy issues for the utility are decided by the  
4 City Council as the governing body.

5 Q. So the choice between using, say, a 2%  
6 exceedance or a 1% exceedance drought, a design  
7 drought for planning, would that also be a  
8 policy decision for the City Council?

9 A. Yes, it would.

10 Q. You were present through the testimony of John  
11 Winchester, weren't you?

12 A. Yes.

13 Q. What is the most important aspect of John  
14 Winchester's testimony?

15 A. I think Mr. Winchester provides the foundational  
16 information that we, as a utility, need to have  
17 in order to understand the risks that drought  
18 presents to us going forward to meeting the  
19 demands of our customers. And what we need to  
20 have in terms of capacity for raw water supply  
21 and the ability to treat and deliver that water  
22 and meet our customers in those extreme  
23 conditions.

24 Q. Mr. Pajor, if you would turn in the purple  
25 binder.

1 A. (Witness reviews document).

2 Q. Under tab of strategic plan. And then behind to  
3 the strategic plan follow-up plan document  
4 beginning on Page 25 behind that tab.

5 A. Okay.

6 Q. What is that document that we are looking at  
7 there?

8 A. This is a document that is a reproduction of the  
9 PowerPoint presentation that was utilized with  
10 the City Council in July of 2014 regarding  
11 strategic planning work that they had  
12 undertaken.

13 Q. Does it go all the way back through the, to the  
14 discussion heading in the lower right on Page  
15 37?

16 A. (Witness reviews documents). Yes, it does.

17 MR. McLEOD: I will hand this to the  
18 reporter to have it marked as Exhibit 9.

19 (City Exhibit 9 was marked for  
20 identification by the Reporter.)

21 BY MR. McLEOD:

22 Q. Mr. Pajor, just for clarity, is the printed  
23 material shown on the reverse of that 37th page  
24 is that actually part of this document that we  
25 just marked as Exhibit 9 (indicating)?

1 A. (Witness reviews documents). No, it is not.

2 MR. McLEOD: I will offer Exhibit 9 for  
3 admission as identified by the witness as staff  
4 briefing for the City Council on recommendations  
5 for this strategic plan.

6 THE HEARING OFFICER: Any objections?

7 MR. STUCKY: Can I voir dire with just  
8 one question?

9 THE HEARING OFFICER: Okay.

10 MR. STUCKY: Mr. Pajor, were you  
11 involved in any of these discussions that help  
12 lead to the strategic plan?

13 A. Yes.

14 MR. STUCKY: No objection.

15 THE HEARING OFFICER: Exhibit 9 will be  
16 admitted.

17 BY MR. McLEOD:

18 Q. Mr. Pajor, do pages 28 to 31 of the presentation  
19 include a section on water supply?

20 A. Yes, that's correct.

21 Q. And did you also personally participate in the  
22 discussions that related to that section of the  
23 recommendations?

24 A. Yes, sir, I did.

25 Q. Was the main focus here on expansion of water

1 supply to enable the City to last through a 1%  
2 exceedance drought without having to impose  
3 stage 3 and stage 4 restrictions under the  
4 City's drought plan?

5 A. Yes, that's correct.

6 Q. Looking at Page 28, what did staff expect the  
7 City could accomplish by funding a supply option  
8 to increase supply by ten million gallons a day  
9 coupled with annual conservation of .35 percent?

10 A. The objective was to be able to reduce to an  
11 absolute minimum the number of days during a  
12 severe drought event in which customers would be  
13 subjected to the restrictions that are contained  
14 in our drought response plan, specifically in  
15 stage 3 and stage 4 of that plan.

16 Q. Was it the conclusion or belief of staff that if  
17 they accomplished those goals they could extent  
18 the City's 1% drought protection by some amount?

19 A. Yes. With the implementation of that additional  
20 water we would be able to reduce considerably  
21 the impact on our customers and eliminate during  
22 the 50 year planning period, eliminate stage 3  
23 and stage 4 conditions for our customers.

24 Q. How far in to the future could we expand that  
25 protection with these alternatives?

1 A. With those alternatives the 50 year planning  
2 period of the current water supply plan would be  
3 covered.

4 Q. What were the water supply alternatives that  
5 were under consideration?

6 A. We looked at the possibility of obtaining  
7 treated water from the El Dorado reservoir, from  
8 the City of El Dorado. We looked at the  
9 possibility of well water supply from the  
10 El Dorado reservoir. And we looked at  
11 improvements that could be made in the Aquifer  
12 Storage and Recovery Project.

13 Q. What did the City Council ultimately determine  
14 as among those alternatives?

15 A. City Council directed that we would pursue the  
16 ASR alternative.

17 Q. Looking at the cost comparison in the lower  
18 right corner on Page 30 what was the cost  
19 estimate for those improvements?

20 A. \$421 million dollars.

21 Q. And note, too, for that comparison table  
22 reflects the City was unable to confirm with  
23 El Dorado that the ten million gallons per day  
24 from El Dorado reservoir would be available  
25 exclusively to Wichita during a 1% drought. Was

1           that a problem with the El Dorado alternatives?

2       A.    Yes, absolutely.

3       Q.    Was that because the point of adding the supply  
4           source was to specifically protect against  
5           shortages in the 1% drought?

6       A.    That is correct.  The only time that we need  
7           additional water supply for the next 50 years is  
8           during that extreme drought event, and that's  
9           when we could not be assured we could have  
10          access to that water.

11      Q.    Did the existing findings and orders for the  
12          City's applications to appropriate water  
13          associated with Phases I and II of the ASR  
14          project contain any constraint on lowering  
15          groundwater levels to create physical recharge  
16          capacity?

17      A.    No.

18      Q.    Do they contain presently any cap on the  
19          quantity of physical recharge credits that could  
20          be accumulated?

21      A.    No.  There is no cap as to how many credits we  
22          could accumulate, under the existing conditions.

23      Q.    Is it possible, therefore, for the city  
24          operating within its existing ASR permit  
25          conditions to draw on its existing water rights

1 in the Equus Beds well field to lower  
2 groundwater level in the well field and still  
3 create physical recharge capacity and storage  
4 for the ASR system?

5 A. It is indeed consistent with the requirements of  
6 the existing permits, and it is the only way we  
7 have identified to produce ASR credits today.

8 Q. Is there a limit on the amount of ASR recharge  
9 credits that the City can withdraw in a year  
10 under the existing permits?

11 A. Yes.

12 Q. What is that limit?

13 A. I don't recall.

14 Q. In order to achieve optimum conditions for  
15 physical recharge, to what level would the City  
16 need to reduce the water levels of the Equus Bed  
17 well field?

18 A. We would need to reduce it to the 1998 levels in  
19 order to have an affected area that we could  
20 recharge with our current project.

21 Q. And what would be the amount of recharge  
22 capacity we would expect to create with that?

23 MR. STUCKY: I will object to this line  
24 of questioning. I am not sure we heard any  
25 expertise on the modeling that was performed by

1 the City with this witness, and his testimony in  
2 that regard has to do with modeling projections;  
3 and I am not sure this witness did anything in  
4 that regard.

5 MR. McLEOD: I can tell you the witness  
6 did not do any modeling. But the question, I  
7 think, is not seeking that, but rather simply  
8 seeking the witness' understanding of what we  
9 might hope to accomplish by taking the water  
10 levels down to the 1998 levels in terms of  
11 gallons per day that would allow a recharge.

12 THE HEARING OFFICER: Is there a way  
13 you can rephrase that's clearly within his  
14 domain?

15 MR. McLEOD: I don't know. Possibly  
16 not. Let's skip that one.

17 BY MR. McLEOD:

18 Q. Mr. Pajor, rather than lowering groundwater  
19 levels in the Equus Bed well field to create  
20 physical recharge capacity and storage for the  
21 ASR system, has the City proposed an alternative  
22 that would allow to accumulate recharge credits  
23 without having to reduce existing water levels?

24 A. Yes, we have.

25 Q. Is that basically an alternate recharge

1 accounting method that could operate during full  
2 aquifer conditions?

3 A. Yes, when there is water available in the Little  
4 Ark.

5 Q. So part of the concept would be there would have  
6 to be water there that the City could draw,  
7 treat and inject, if there were storage capacity  
8 available to receive it?

9 A. Yes. And we would, indeed, under this  
10 alternative, we would withdraw it from the  
11 water, we would treat it as we would for  
12 injection.

13 Q. So part of the basis of the proposal also would  
14 be the quantity of level the City diverts that  
15 can't be physically recharged through the ASR  
16 system would be sent to the City's main  
17 treatment plant for direct city use to meet city  
18 demands?

19 A. Yes.

20 Q. And would the water that was left in the  
21 aquifer, as the result of utilizing that Little  
22 Arkansas River flow, then form the basis of the  
23 calculation of an ASR aquifer maintenance credit  
24 under the City's proposal?

25 A. It would indeed, because that would be water we

1 would not be removing to meet customer demand  
2 because we were able to meet it with the treated  
3 water from the ASR project.

4 Q. And that proposed aquifer maintenance credit,  
5 would it have similar characteristics to the  
6 current physical recharge credits that exist in  
7 the ASR system?

8 A. Yes, it would.

9 Q. If you would look at the black binder behind the  
10 tab of summarizing documents.

11 A. (Witness reviews documents).

12 Q. Do you see a, and let me back up to this staff  
13 briefing.

14 MR. McLEOD: Did I have this admitted,  
15 Exhibit 9?

16 THE HEARING OFFICER: I thought so.

17 MR. PAJOR: You did, but you didn't  
18 deliver it.

19 MR. McLEOD: I thought I had.

20 MR. PAJOR: I tried to tell you but you  
21 turned the other direction.

22 BY MR. McLEOD:

23 Q. In that tab behind the black binder, Mr. Pajor,  
24 is there a document dated January 23rd, 2018,  
25 that is captioned testimony provided by Senate

1 Agriculture and Natural Resources?

2 A. Yes, there is.

3 Q. What is that document?

4 A. This is written testimony that I provided to  
5 briefing that was given to the Senate  
6 Agriculture and Natural Resources Committee of  
7 the Kansas legislature on January 23rd of 2018.

8 Q. And the document refers on its last page to an  
9 attachment handout entitled, Equus Bed Aquifer  
10 and Preparing Wichita For Drought, Proposed  
11 Changes. Would that handout be this graphic  
12 document which is near the start of the summary  
13 documents tabbed section?

14 A. Yes, sir, that's the attachment that was  
15 provided with that testimony.

16 Q. What was the purpose of this document?

17 A. Of the attachment?

18 Q. Of the letter and attachment.

19 A. Okay. The entire testimony to the senate  
20 committee, and the attachment, was to provide an  
21 update on our Aquifer Storage and Recovery  
22 Project, how we were transitioning the project  
23 from its original envisioned mission of moving  
24 water from wetter years to water to dryer years,  
25 to much more of a long term project because

1 customer demand had changed over the course of  
2 time so that demands were muted compared to  
3 original projections. And the aquifer was  
4 physically much fuller, near predevelopment  
5 levels, compared to when ASR was first initiated  
6 as a project. So we wanted to bring them  
7 up-to-date on those changing conditions and the  
8 reasons why we were now looking at ASR  
9 specifically to generate credits over a long  
10 time horizon for relatively rare use during  
11 extreme drought events.

12 Q. In terms of changes that the City was  
13 considering and proposing at the time, was the  
14 City asking legislatures to do anything here or  
15 simply informing them of what the City was going  
16 to be asking the Division of Water Resources to  
17 do?

18 A. It was simply the latter. It was simply an  
19 update to them as to our project and to advise  
20 them of the work that we were engaged to take  
21 forward to the Division of Water Resources and  
22 the chief engineer.

23 MR. McLEOD: Let's mark this as an  
24 exhibit.

25 (City Exhibit 10 was marked for

1 identification by the Reporter.)

2 BY MR. McLEOD:

3 Q. On the second page, Mr. Pajor, of the briefing  
4 letter that we have marked as Exhibit 10, it  
5 provides a short discussion of how changes in  
6 actual and projected customer demands led to  
7 that repurposing of the ASR facilities. Can you  
8 explain a little bit more of that.

9 A. Yes. As originally envisioned we were going to  
10 need the ASR project to meet the more routine  
11 needs of our customers, earlier in the 50 year  
12 planning period. As we revisited the  
13 projections of demand we saw that because of a  
14 reduction in the per capita demand for  
15 customers, due to improved water efficiencies  
16 within the use of our customers, by our  
17 customers, and because of additional changes to  
18 water usage, that as the result of that we now  
19 had sufficient water in our native water rights  
20 to meet that customer demand in all but extreme  
21 drought conditions for that entire 50 year  
22 period.

23 Q. And so with that, what became the only purpose  
24 for which the City still needed to be able to  
25 recover ASR credits?

1 A. To meet the demand of our customers in prolonged  
2 extreme drought events, to avoid needing to go  
3 in to stage 3 and stage 4 restrictions within  
4 our drought response.

5 Q. In the course of extreme drought is it  
6 reasonable to expect to have any abundant flows  
7 in the river that we could treat and inject in  
8 the ASR facilities?

9 A. That would not be expected.

10 Q. So really the capacity, to generate recharge  
11 credits in a time of abundance, would be the  
12 characteristic of the ASR project that would  
13 make it a potential mitigation tool; is that  
14 correct?

15 A. That is correct.

16 Q. Back in the third page of the letter did you  
17 identify for the committee some factors that  
18 limit the viability of ASR as a drought  
19 remediation tool?

20 A. Yes, we did.

21 Q. Looking first at the existing basis for recharge  
22 credits, is the problem there that under current  
23 conditions the City would actually have to  
24 partially deplete the aquifer in order to inject  
25 water to accumulate credits?

1 A. Yes. That is the problem.

2 Q. And I will ask this subject to later foundation  
3 because I know you didn't do the drought  
4 modeling, but you have seen the City's drought  
5 modeling of the 1% drought; is that correct?

6 A. Yes, absolutely.

7 Q. And in the proposal that has been admitted as  
8 Exhibit 1 there is a table that reflects how the  
9 City believes demands would need to be allocated  
10 to manage resources on an integrated basis in a  
11 1% drought, is that right?

12 A. Yes.

13 Q. In that table in the proposal, what does the  
14 City believe it would need as a minimum  
15 accumulation of credits to meet the supply  
16 demands during a 1% drought?

17 A. I would have to refer to that table to determine  
18 that number.

19 Q. I think that may be table 2.5.

20 A. (Witness reviews documents).

21 Q. Sir, is there actually a row in that table, Mr.  
22 Pajor, that shows the projected amount of  
23 credits the City would need to take for a model  
24 eight year drought?

25 A. Yes, there is.

1 Q. What's the total of that row going across for  
2 the credits the City would need to use during  
3 that event?

4 A. There is not a total provided here, but it would  
5 be 5,651 plus 19,907 plus 6,732 plus 15,552 plus  
6 1,980 acre feet.

7 Q. So if you did a little quick addition, can you  
8 tell us what that adds up to?

9 A. Well, almost 50,000.

10 Q. And comparing that to what the City has now, as  
11 of the date of the chief engineer's April 11th,  
12 2019, order, which correct me if I am wrong, is  
13 the most current, setting forth available  
14 recharge credits for the end of the year 2016,  
15 was the quantity of credits available to the  
16 City only 6,372.2 acre feet?

17 A. That is correct.

18 Q. To achieve a cumulation of 50,000 acre feet or  
19 more in credits, would it follow that the  
20 aquifer would have to be maintained in a  
21 partially depleted state potentially for a  
22 period of years or decades?

23 A. Under our current permit conditions, yes, that's  
24 what we would have to do in order to get the  
25 physical recharge credits.

1 Q. Because it would take quite awhile to accumulate  
2 that many credits; is that correct?

3 A. It would indeed.

4 Q. If a drought occurred during the time the  
5 aquifer was maintained in that partially  
6 depleted state, what would be the impact in  
7 terms of dealing with that drought?

8 A. Under our current permit conditions the  
9 difficulty would be that because we risk in  
10 later years of a protracted drought not being  
11 able to recover our credits when we need them to  
12 meet customer demand, we would have to take the  
13 credits out earlier in a drought event. And as  
14 we go through a drought event, we don't know how  
15 long it is going to last.

16 Q. Would having the aquifer in a partially depleted  
17 state to accommodate physical recharge also put  
18 the City in the posture of going in to a drought  
19 with lower starting levels in the aquifer?

20 A. Yes. Which would disadvantage all water users  
21 in the area well field.

22 Q. Would that also have the affect of depleting  
23 water levels in the aquifer to the 1993 levels  
24 quicker?

25 A. Yes.

1 Q. And again, recognizing that you haven't done  
2 modeling, you have seen some of the modeling  
3 result that suggest that would occur within the  
4 first two years of the drought; is that correct?

5 A. Yes.

6 MR. STUCKY: I will object again to  
7 this line of questioning. We are talking about  
8 projections based on the model, and projections  
9 as far as what future needs are, what the impact  
10 of the aquifer would be, number one, it's  
11 outside of the scope of the expert report that  
12 was furnished; but, number two, it was already  
13 indicated that this expert doesn't have any  
14 credentials or experience on as it relates to  
15 the modeling itself. And actually didn't help  
16 with the model itself. So I think we have tried  
17 to be lenient to the questioning, but this is  
18 just going way outside of the scope of his  
19 expert report. And there is no foundation for  
20 it.

21 MR. McLEOD: So responding to that, let  
22 me point out the basic fact, which should not be  
23 lost on participants in the hearing, that Mr.  
24 Pajor is not simply an expert witness. Mr.  
25 Pajor is in management role with the City where

1 he has served for a period of many years, and  
2 has the ability to testify to the facts known to  
3 him and beliefs and policy judgments of the City  
4 as well as things that are covered as his expert  
5 opinions in his expert report.

6 So I think it's completely permissible  
7 to ask Mr. Pajor about the projections that he  
8 has seen that reflect, even though he didn't do  
9 the modeling, that the City expects and is  
10 making policy based on the expectation that it  
11 will lose its ability to recover those credits  
12 in the second year of the drought. The  
13 important consideration being here, not whether  
14 the modeling is right, wrong or indifferent, but  
15 whether Mr. Pajor, in city management, believes  
16 that to be the case because that's going to  
17 inform their action based on policy judgment.

18 MR. STUCKY: If it's only for Mr.  
19 Pajor's knowledge on that subject and not for  
20 the truth of the matter asserted, we'll withdraw  
21 the objection, I guess, if it's only limited for  
22 that limited purpose.

23 THE HEARING OFFICER: Will there be  
24 witnesses that form foundation for what he, what  
25 the City was relying on?

1 MR. McLEOD: I expect later on we'll  
2 have witnesses to testify about all the modeling  
3 of the 1% drought and what showed for the 1%  
4 drought.

5 THE HEARING OFFICER: You may proceed.

6 BY MR. McLEOD:

7 Q. And to go back and cover something based purely  
8 on facts observable, Mr. Pajor, you were present  
9 with the City in a management role in 2011 and  
10 2012, weren't you?

11 A. Yes, I was.

12 Q. What happened in 2011 and 2012 with respect to  
13 drought conditions in the aquifer?

14 A. During that time period the region experienced a  
15 significant reduction in precipitation received  
16 compared to averages. And we experienced, as a  
17 utility, considerable increase in customer  
18 demand for water, especially seasonal water use  
19 during that period of time. And we were  
20 experiencing a significant decline in the Cheney  
21 surface reservoir that was becoming concerning  
22 as to our ability to meet customer demand, had  
23 those conditions persisted more than the two  
24 years that it did.

25 Q. And in the aquifer, in that two year drought,

1 Mr. Pajor, what happened to the water levels in  
2 the aquifer during that two year drought?

3 A. During that two year drought our drawing on that  
4 aquifer was not substantially different, but the  
5 other water rights holders obviously were  
6 increasing their water use because of the  
7 climate conditions.

8 Q. Did water levels decline below the 1993 levels  
9 in that drought?

10 A. No.

11 Q. Did we recover any credits in that drought?

12 A. No.

13 Q. Did going through the experience of that two  
14 year drought, and experiencing the conditions at  
15 Cheney and in the aquifer, have an impact on the  
16 City's drought policy and planning?

17 A. Absolutely it did. Because as we were reporting  
18 to the City Council and to the City manager the  
19 conditions at Cheney Reservoir, there was  
20 increasingly a concern for the fact that we did  
21 not have a structured drought response plan in  
22 place at that time. It was unclear as to  
23 exactly how we were going to manage our way  
24 through that process.

25 Q. And I think you had indicated earlier, Mr.

1 Pajor, in your testimony that one of the other  
2 problems with the existing conditions is the  
3 threat of losing the ability to recover credits  
4 makes the City take them early in the first two  
5 years of drought.

6 A. Yes.

7 Q. So we have, therefore, the twin problems that we  
8 are starting with lower levels, if we have to  
9 keep the aquifer depleted to enable recharge,  
10 plus we get to the 1993 levels faster and the  
11 City is under pressure to take those credits  
12 early, does the City even know in the first two  
13 years if it needs those credits for supply  
14 purposes?

15 A. No. And no one can know that. Because until  
16 you are further along in time you can't  
17 determine how long the drought is going to  
18 persist or how severe it is going to be until  
19 after it's over really.

20 Q. And you had indicated there is an aggregate  
21 limit on the City's ability to withdraw credits,  
22 although you didn't know what the limit was. If  
23 the City managed over a period of years to  
24 accumulate credits beyond the amount it is able  
25 to withdraw, would the City then have to make a

1 decision as to what to do with some of its  
2 credits even in the very first year of the  
3 drought?

4 A. Yes. It certainly could be the case.

5 Q. Again, looking back to the table in the proposal  
6 in Exhibit 1, that showed that model, 1% drought  
7 scenario, what does the City think it would  
8 actually need to use in credits in the first  
9 year of the drought?

10 A. We don't anticipate that we would need to use  
11 any of the credits in the first year of the  
12 drought.

13 Q. So for supply purposes, no credits?

14 A. Right, no credits.

15 Q. But if the City had credits accumulated beyond  
16 its annual ability to withdraw, the City might  
17 be forced to take credits in that year, though  
18 it doesn't need them?

19 A. Yes, that could certainly be the case.

20 Q. And if you look at the second year, what does  
21 the City think it would have to take in the  
22 second year of the drought?

23 A. 5,651 acre feet.

24 Q. Not even as much as the City has accumulated in  
25 credits currently; is that correct?

1 A. Correct.

2 Q. But the City would have to make a decision on  
3 its full accumulation in that year because of  
4 the threat of losing the ability to recover them  
5 in the second year?

6 A. Under our existing permit conditions, yes.

7 Q. Is there any reason the City would take any  
8 credits in the first year of a drought or more  
9 than the 5,651 acre feet in the second year,  
10 apart from the consequence that credits not  
11 taken would become unrecoverable for the  
12 duration of the drought?

13 A. No.

14 Q. I think you alluded to this, but does the City  
15 have any way of knowing in the first or second  
16 year of a drought whether that drought is  
17 ultimately going to be a three year drought, a  
18 four year drought or a six year 1950s drought,  
19 or an eight year 1930s dustbowl drought or  
20 exceeding a megadrought of the 20th century?

21 A. We don't have any way of knowing.

22 Q. I am going to give you a couple of hypotheticals  
23 to illustrate a point. And assume with me for  
24 purposes of the hypothetical that the limit on  
25 the City's ability to take credits in a given

1 year is 19,000 acre feet, and that the City has  
2 accumulated, for purposes of a hypothetical,  
3 38,000 acre feet in credits. And a drought  
4 comes along. The City takes 19,000 acre feet in  
5 drought year one, 19,000 acre feet in drought  
6 year two, to prevent the credits being stranded.  
7 And then it turns out that it's only a two year  
8 drought. The City takes all the credits and the  
9 drought is over.

10 In that scenario, with the aquifer  
11 depletion exacerbated by a withdrawal of 38,000  
12 acre feet of credits, even though the City could  
13 have managed to supply needs with 5,651 acre  
14 feet of credits, how is anyone benefited by  
15 that?

16 A. I don't think they would be benefited by that.  
17 That's why the existing permit conditions are  
18 not ideal for properly managing the aquifer.

19 Q. Looking now to look at the other end of drought  
20 duration. Let's this time have a scenario in  
21 which the city accumulated 38,000 acre feet in  
22 credits and takes 19,000 acre feet each year in  
23 drought years 1 and 2 to prevent the credits  
24 being unrecoverable. So that 38,000 acre feet  
25 is gone from the aquifer. Water levels in the

1           aquifer then decline to 1993 levels, does that  
2           38,000 acre feet magically come back when those  
3           water levels decline below the 1993 levels?

4       A.    No.

5       Q.    So the 38,000 acre feet is still gone, the  
6           drought ultimately turns out to be a six year  
7           1950s drought.  In this scenario, if the City  
8           had been allowed to wait and pump the 38,000  
9           acre feet of credits in drought years three and  
10          four, even though the water levels were then  
11          below the 1993 levels, would the impact of that  
12          38,000 acre foot withdrawal on water levels at  
13          the end of the drought be any different?

14      A.    Could you repeat the question, please.

15      Q.    So the question is, if the City had been allowed  
16          to wait and pump the 38,000 acre feet of credits  
17          in drought years three and four, instead of one  
18          and two, even though the levels were below the  
19          1993 levels in years three and four, would the  
20          cumulative impact of that 38,000 acre foot  
21          withdrawal on water levels at the end of the  
22          drought be any different because they were three  
23          and four instead of one and two?

24      A.    No, no, no, they would not.

25                   MR. STUCKY:  I am going to object and

1 ask for foundation as far as how the witness  
2 knows the answer to this question.

3 MR. McLEOD: It's a hypothetical  
4 question.

5 A. It's a hypothetical question. If the water is  
6 gone, the water is gone.

7 MR. McLEOD: I would argue that's  
8 actually a common sense analysis and not  
9 particularly a matter of expertise as well. If  
10 the City draws a 38,000 acre feet in years one  
11 and two, it's gone. And at three and four, it's  
12 still gone. At the end of the drought it's  
13 still gone. If I drank this bottle of water  
14 now, somebody coming in the room an hour from  
15 now wouldn't know if I drank that water five  
16 minutes ago or if I drank that 9:00 o'clock this  
17 morning.

18 MR. STUCKY: With due respect, I think  
19 the aquifer is lot more complex than a bottle of  
20 water. It is subject to river flows, it is  
21 subject to recharge from rain water, it's  
22 subject to differences as drought persists. I  
23 mean, there is a whole, it's subject to the  
24 nature of the rock layers, and it is subject to  
25 the clay layers as far as infiltration what it

1           could look like. There are all these factors  
2           that influence this answer, that's why we are  
3           modeling this. I think it matters, it's  
4           different than a bottle of water.

5                       MR. McLEOD: I would say that goes to  
6           the weight, if they have criticisms of the  
7           hypothetical and the answer, rather than the  
8           admissibility to the witness' answer.

9                       THE HEARING OFFICER: Will you have an  
10          expert witness address these types of questions?

11                      MR. McLEOD: We'll have somebody going  
12          through the modeling later on. As to all the  
13          factors argued by Mr. Stucky, I don't know that  
14          anybody is going to try to go through how some  
15          factor would allegedly made this result  
16          different if the water was drawn in years three  
17          and four versus one and two. I am not persuaded  
18          of the soundness of that argument that was  
19          articulated.

20                      THE HEARING OFFICER: Well, it gives me  
21          pause. That may be an appropriate topic for  
22          cross examination. I will let the question and  
23          answer stand, but there is some validity in  
24          expecting an ability to delve deeper into these  
25          type of issues, and we have had very specific

1 testimony before now. So you may proceed.

2 MR. McLEOD: I will try to avoid  
3 additional detailed hypotheticals.

4 BY MR. McLEOD:

5 Q. Mr. Pajor, would adjusting the lower index  
6 limits help to keep the aquifer fuller by  
7 allowing the City to wait longer before it has  
8 to decide whether to draw credits in a drought?

9 A. Yes, it would because those longer lived drought  
10 events occur less frequently.

11 Q. Which is a point I probably skipped fast, but  
12 you were here during Mr. Winchester's  
13 presentation this morning?

14 A. Yes.

15 Q. He had modeled a range of droughts of various  
16 durations and exceedance probabilities in the  
17 table, which I think is an attachment C to the  
18 proposal there in his technical memorandum. If  
19 you could refer to that table.

20 A. (Witness reviews documents).

21 THE HEARING OFFICER: I am sorry, which  
22 exhibit was that?

23 MR. McLEOD: It would have been one of  
24 the earlier exhibits Mr. Winchester had shown.  
25 It is on Page 6 of 7 of attachment C to the

1 proposal, Exhibit 1.

2 BY MR. McLEOD:

3 Q. Looking at that table, Mr. Pajor, do you see  
4 where the droughts include two year duration of  
5 droughts?

6 A. Yes, I do.

7 Q. Is that drought identified in the table as a 10%  
8 drought?

9 A. Yes, it is.

10 Q. And I think this ties to what you were saying  
11 about frequency of small droughts and large  
12 droughts. Would that 2% drought, as modeled  
13 there in Mr. Winchester's table there as 10%  
14 drought, be expected to occur about once a  
15 decade versus the approximate hundred year  
16 occurrence of a 1% drought?

17 MR. STUCKY: I guess I will object to  
18 this for two reasons. Number one, I don't think  
19 this expert has any kind of expertise on this  
20 subject matter, number one. But, number two, I  
21 think it's cumulative, and we already had  
22 testimony on this table.

23 MR. McLEOD: We had testimony on the  
24 table, but I don't think that it went in to the  
25 point that we can expect two year droughts to

1 occur a lot more frequently than hundred year 1%  
2 droughts. And that's a question for Mr. Pajor  
3 he could probably answer it from his own  
4 personal experience.

5 A. I would also answer it from the experience of a  
6 utility management. This table reinforces, it  
7 quantifies the estimate of a two year duration  
8 drought being a much higher probability event  
9 than an eight year duration drought.

10 Q. Would the longer decisional period that the City  
11 would derive from lower index limits, be likely  
12 for that reason to result in less frequent use  
13 of credits, because the City would not be under  
14 pressure in the first two years of the drought  
15 to take credits it doesn't need?

16 A. Yes. Absolutely.

17 THE HEARING OFFICER: So, pardon me,  
18 but as I understand it, because I don't think I  
19 still resolved the objection, if I understand  
20 correctly, Mr. Pajor is answering from the  
21 standpoint of your view as a city manager, and  
22 city planner, is that what it is? I am getting  
23 objections because this is not his area of  
24 expertise, but what he would do in his role in  
25 city management is his area of expertise.

1                   So I am trying to navigate the  
2                   distinction between those.

3                   MR. McLEOD: Yes, I would say again, in  
4                   that regard whether even Mr. Winchester is right  
5                   or wrong about anything, is less significant  
6                   than that the City believes that he is right,  
7                   and the City believes and will be making policy  
8                   based on the notion as presented by Mr.  
9                   Winchester's work, that that two year drought is  
10                  going to occur about ten times as commonly as a  
11                  1% exceedance drought. So it really is, from a  
12                  managerial perspective, the important part is  
13                  the City believes it to be true, whether it's  
14                  true or not. Whether Mr. Winchester is a  
15                  complete hack, the City will be making its  
16                  policy decisions that it is accurate good  
17                  science.

18                  THE HEARING OFFICER: Which would not  
19                  be a good outcome. But I understand, I  
20                  understand the differentiation. I am concerned  
21                  that we do end up with solid information as to  
22                  whether or not the foundational information is  
23                  reliable and accurate.

24                  So if Mr. Pajor is not testifying to  
25                  that point, then he can testify as to what his

1 interpretation or what the City's interpretation  
2 of this information is.

3 MR. McLEOD: I think we are relying on  
4 Mr. Winchester for the calculation of all of  
5 those exceedance periods as they are spread in  
6 the table. And Mr. Pajor is not making his own  
7 opinion about the science.

8 THE HEARING OFFICER: So perhaps we  
9 could be very careful about how we couch the  
10 language, so that we can try to keep those two  
11 descriptions separate.

12 Mr. Stucky, will that help?

13 MR. STUCKY: Yes. I have no objection  
14 whatsoever if Mr. Pajor wants to testify as to  
15 what decisions the City is making with regard to  
16 planning; but to the extent there is any  
17 opinions on whether or not it's good or bad  
18 planning, I don't think any testimony like that  
19 should be permitted.

20 THE HEARING OFFICER: I think we could  
21 probably draw that distinction, if we are  
22 careful, Mr. McLeod.

23 BY MR. McLEOD:

24 Q. To say it again, whose role is it to do this  
25 planning for the City of Wichita?

1 A. Well, the policy decisions are made by City  
2 Council. The director and his staff are  
3 responsible for implementing those policies and  
4 day-to-day administration of the utility  
5 including decisions on water supply sourcing.

6 Q. Thank you. You previously touched upon, in your  
7 testimony, the point about current aquifer  
8 levels resulting chiefly from the City's  
9 integrative water supply plan, the change and  
10 use of resources that it made in '93 to '98, of  
11 which has been an operating strategy for  
12 sometime now, to integrate management and  
13 optimize water resources. Does the City's  
14 commitment to that effort apply equally both in  
15 times of abundance and in times of drought?

16 A. Yes, it does.

17 Q. Is the City's policy preference with respect to  
18 the aquifer to keep the aquifer as full as the  
19 City can keep it?

20 A. Yes. The experience is much less loss than the  
21 surface reservoir and those are our two primary  
22 water supplies.

23 Q. Is the City committed to making water resource  
24 management practices that are governed by  
25 outcome based results, focused on the long term

1 sustainability of all the available water  
2 supplies?

3 A. Yes.

4 Q. Does the City's proposal, in fact, contemplate  
5 the City will continue to maintain an ASR  
6 operational priority focused on generational  
7 physical recharge credits where and when that's  
8 possible to do?

9 A. Absolutely.

10 Q. And to tack on perhaps a qualifier to the  
11 question, where and when it's possible to do  
12 without having to deplete the aquifer to create  
13 the opportunity?

14 A. That would be the ideal, yes.

15 Q. Does the ability to develop and recover aquifer  
16 maintenance credits contribute to a management  
17 strategy focused on maintaining the maximum  
18 quantity of water possible in aquifer storage  
19 within the Equus Beds well field?

20 A. Yes, it does, because it doesn't require us to  
21 remove water from the aquifer to inject physical  
22 recharged credit water under our existing permit  
23 conditions.

24 Q. If you would turn to table 3-1 in the proposal.

25 A. (Witness reviews documents).

1 Q. This has been admitted as Exhibit 1.

2 MR. STUCKY: Is there a page number?

3 THE HEARING OFFICER: It looks like  
4 3-11.

5 Q. Mr. Pajor, as to the resources that are in the  
6 columns on the left of that table, do you  
7 believe that they will, in fact, experience the  
8 benefits that are spelled out in the column on  
9 the far right of the table, if the City can use  
10 aquifer maintenance credits as proposed?

11 A. Yes. If we are allowed to use aquifer  
12 maintenance credits the benefits of the column  
13 on the right can be achieved for all four of  
14 those resources.

15 MR. STUCKY: Again, I will clarify, is  
16 it his belief that these can be achieved? Or is  
17 he testifying to the fact that they are actually  
18 are achieved? I want to draw a distinction  
19 between the two.

20 Q. Mr. Pajor, can you answer both of those? Do you  
21 believe that they will be achieved and is it  
22 your testimony that they will be achieved?

23 A. It is my belief that they will be achieved and  
24 my testimony is that they will be achieved  
25 provided we have the capability of operating our

1 projects with aquifer maintenance credits.

2 MR. STUCKY: And, again, it is our  
3 opinion that his conclusions are based on the  
4 modeling that exists in the proposal. So to  
5 reach these ultimate conclusions you would have  
6 to have expertise on that subject matter. So  
7 it's the same kind of distinction we were  
8 drawing before.

9 Q. So, Mr. Pajor, let's look at that first box in  
10 the upper right, and let's just look at that  
11 foundationally. As the benefits stated there it  
12 begins with the line, ASR Phase I permits would  
13 not be modified. In fact, part of the proposal  
14 is that the ASR Phase I permits would not be  
15 modified; is that correct?

16 A. That's correct.

17 Q. That's a fact, that's not a matter of your  
18 expertise, is it?

19 A. That's correct.

20 Q. That's a feature of the proposal that has been  
21 admitted as Exhibit 1. And would have been  
22 ascertainable since the time the proposal was  
23 submitted. Then the premise below that,  
24 regional groundwater levels can be managed at  
25 the benefit of water quality and all users.

1 Without particular expertise, you have already  
2 said you know that having the AMCs relieves the  
3 requirements for the City to pull the aquifer  
4 down to deplete it, to create physical recharge  
5 credits; is that correct?

6 A. Yes.

7 Q. And doesn't that represent and constitute  
8 management of the aquifer to the benefit of  
9 water quality and users?

10 A. It does in my opinion, yes.

11 Q. And that's not really a matter of expertise, as  
12 much as a matter of looking at the fuller  
13 aquifer and knowing that it's better?

14 A. Correct.

15 MR. STUCKY: Again, because there is so  
16 much that comes in to play here. We are talking  
17 about a fuller aquifer. You know, we are  
18 talking about the impact of this proposal during  
19 a time of drought, that is a different  
20 statement. We are talking about the impact of  
21 this proposal when the aquifer is full. The  
22 second statement, as shown on the screen up  
23 there, refers to water quality. There is no  
24 expertise as to groundwater quality. To try to  
25 give some sort of blanket assertion that these

1 benefits will be achieved, again is way outside  
2 of the scope of this expert's ability to  
3 testify.

4 THE HEARING OFFICER: In terms of this  
5 particular line of questioning with this table I  
6 have to agree with Mr. Stucky. So I think we  
7 need to strike those questions and have you move  
8 on.

9 MR. McLEOD: Okay.

10 BY MR. McLEOD:

11 Q. Mr. Pajor, at least as to the big benefit of not  
12 having to deplete the aquifer, if we have  
13 maintenance credits, does that result in a  
14 fuller aquifer?

15 A. Yes.

16 Q. Because we don't have to deplete it?

17 A. Yes.

18 Q. And if the City doesn't have to take credits,  
19 when the credits aren't needed, doesn't that  
20 result in a fuller aquifer?

21 A. Yes, it would.

22 Q. In the existing permit conditions, Mr. Pajor,  
23 are there restrictions that prevent the City  
24 from injecting recharged water in to the aquifer  
25 when water levels are within ten feet of ground

1 level?

2 A. Yes, there are.

3 Q. By virtue of that restriction, is it effectively  
4 impossible for the City operating consistent  
5 with the permit conditions to cause an  
6 unreasonable increase in water levels by  
7 injecting recharge?

8 A. Yes, it is. And I could expound on that a bit.  
9 The problem is as the aquifer gets very near to  
10 either predevelopment conditions or the permit  
11 conditions, the ten foot below ground surface,  
12 while there may be that last percent or two of  
13 space that's available, because we are not  
14 allowed to exceed that ten foot below ground  
15 surface, the ability to put the water in at our  
16 recharge wells and not go above the ten feet  
17 while trying to get the water out to that last  
18 couple of percent of the saturated zone is very  
19 problematic.

20 And the analogy I use is when you are  
21 trying to get the last half of gallon of gas in  
22 your tank and the pump keeps clicking off. It's  
23 very hard to get that last half gallon forced in  
24 there because it's so full. The tank is so  
25 full.

1 Q. So that restriction is actually a limitation on  
2 the City's ability to even achieve a full  
3 recharge that would be permitted by its permits?

4 A. Yes.

5 Q. The way that that alternative maintenance,  
6 excuse me, aquifer maintenance credits are set  
7 up in the City's proposal, does the existence of  
8 an aquifer maintenance credit inherently propose  
9 that a quantity of water necessarily, or  
10 necessary to meet that credit has been left in  
11 the aquifer by the City at an earlier period?

12 A. Could you repeat the question, please.

13 Q. Let me rephrase it a little this way. Is the  
14 basis of an aquifer maintenance credit in the  
15 City's proposal that the City has left a  
16 quantity of water in the aquifer, and instead of  
17 drawing that water has taken water that was  
18 available that could have been treated and  
19 injected, if there was physical recharge  
20 capacity in the aquifer, and used it as a direct  
21 supply source instead of drawing from the  
22 aquifer?

23 A. Yes. Including the treatment of that water.

24 Q. And in the proposed accounting method for  
25 aquifer maintenance credits, does the City

1 impute a leakage factor to water that's left in  
2 the aquifer by that mechanism?

3 A. Yes.

4 Q. And so if there is an AMC there, a credit that  
5 exists under that accounting method, does the  
6 existence of that credit depend on the City, in  
7 fact, having left water sufficient to satisfy  
8 that credit in an aquifer in an earlier period?

9 A. Yes.

10 Q. And does that fact on which is inherent in the  
11 definition and accounting method for aquifer  
12 maintenance credits, have a bearing on whether  
13 those credits or the drawing of those credits  
14 would create an unreasonable lowering of water  
15 levels in the aquifer?

16 A. Could you repeat that, please.

17 Q. Would the consideration that the water that's  
18 there representing the aquifer maintenance  
19 credit, is water that the City left there in a  
20 prior period?

21 A. Yes.

22 Q. Have a bearing on the question of whether  
23 aquifer maintenance credits could cause an  
24 unreasonable lowering of the aquifer?

25 A. Yes.

1 Q. And what would that bearing be?

2 A. Well, the aquifer maintenance credit is there  
3 because we didn't have to draw the aquifer down  
4 to make physical space to put that water in to.  
5 We were able to leave the aquifer full and still  
6 get the aquifer maintenance credit.

7 Q. And when that credit is drawn, does it really  
8 become more of a timing of when the City is  
9 using the water rather than how much water the  
10 City is using?

11 A. Yes.

12 Q. Does the proposal include any kind of a cap that  
13 would apply to accumulation of all recharge  
14 credits where no cap exists on the current  
15 permits?

16 A. Yes, it does.

17 Q. What is that proposed cap?

18 A. I believe it is 120,000 acre feet.

19 Q. Do you know what the basis was for proposing  
20 that quantity as a cap?

21 A. I believe it's based on the estimated 60,000  
22 acre feet we need for the 1% drought protection  
23 during the 50 year planning period.

24 Q. In correspondence by the chief engineer, and  
25 also in the proposal, more than one party have

1 used the expression functional equivalent to  
2 parallel these aquifer maintenance credits to  
3 the existing physical recharge credits. Can you  
4 explain what is behind that and what the  
5 reasoning there is.

6 A. The reasoning is that we are still diverting  
7 water from the Little Arkansas River. We are  
8 still treating water through the ASR treatment  
9 plant. And we are taking that water to meet  
10 customer demand in town, rather than taking the  
11 equivalent amount of water out of the aquifer.

12 Q. If the City has to deplete the aquifer, and then  
13 physically inject recharge to create a credit,  
14 how is the impact different on the resulting  
15 quantity of water than if the City had just left  
16 that water in the aquifer and taken its source  
17 from the river instead?

18 A. Well, if we don't have to take the water out of  
19 the aquifer and can instead use the water from  
20 the river, then we don't have to create enough  
21 space in the aquifer to take the recharge water.

22 Q. If the City is able to use its aquifer  
23 maintenance credits, and let me back up. If the  
24 City's proposed modifications to its permits are  
25 approved, and it is able to use the aquifer

1 maintenance credits, and delay any decisions to  
2 draw credits during droughts, to maintain the  
3 aquifer at a fuller level, does that have an  
4 impact on risk of impairment for wells adjacent  
5 to the City's well field?

6 A. Yes, it does, it is a favorable impact because  
7 there is more water in the aquifer.

8 MR. STUCKY: I will object once again  
9 to this testimony. There is no expertise on  
10 impairment that has been established for this  
11 witness.

12 MR. McLEOD: Does Mr. Pajor need to be  
13 an expert on impairment to know that a fuller  
14 aquifer reduces the risk of impairment? I am  
15 not thinking that's an expert opinion, just  
16 something that's within a realm of common sense.

17 THE HEARING OFFICER: I tend to agree  
18 with Mr. Stucky.

19 MR. McLEOD: Okay.

20 BY MR. McLEOD:

21 Q. Mr. Pajor, looking in the purple binder to the  
22 tab labeled fluoride simulations.

23 A. (Witness reviews documents).

24 Q. What is the first document that appears there  
25 behind that tab, maybe the only document.

1 A. Preliminary simulation of chloride transport in  
2 the Equus Beds aquifer and simulated affects of  
3 well pumping and artificial recharge and  
4 groundwater flow and chloride transport near the  
5 City of Wichita, Kansas, 1990 through 2008 USGS  
6 report open file 2014-1162.

7 MR. McLEOD: I will have the reporter  
8 mark this as an exhibit.

9 (City Exhibit 11 was marked for  
10 identification by the Reporter.)

11 MR. McLEOD: I will offer this for  
12 admission.

13 MR. STUCKY: No objection to the  
14 document itself.

15 THE HEARING OFFICER: I am sorry, no  
16 objection?

17 MR. STUCKY: No objection to the  
18 document itself.

19 THE HEARING OFFICER: Exhibit 10 will  
20 be admitted.

21 MR. McLEOD: I think it's actually 11.

22 THE HEARING OFFICER: Pardon me.  
23 Exhibit 11 is admitted.

24 BY MR. McLEOD:

25 Q. Mr. Pajor, in the course of your service with

1 the City, have you become aware of chloride  
2 migration issues that affect the Equus Beds well  
3 field?

4 A. Yes, I have.

5 Q. What are the primary sources that have been  
6 identified?

7 A. Relative to the City of Wichita's well field two  
8 primary sources. The Burrton chloride plume,  
9 which is a remnant of past oil and gas  
10 production and development activities, and  
11 natural chloride from the Arkansas River.

12 MR. McLEOD: I will offer Exhibit 10  
13 now to make a point that was reported to the  
14 legislative committee about the original purpose  
15 of ASR Phase I.

16 MR. OLEEN: Mr. McLeod, could you  
17 please just tell me where again in the binder to  
18 find Exhibit 10?

19 MR. McLEOD: Exhibit 10 is behind the  
20 summary documents tab in the black binder. And  
21 actually consists of the January 23rd letter  
22 with an attached handout.

23 MR. OLEEN: Thank you.

24 THE HEARING OFFICER: Any objections to  
25 Exhibit 10?

1 MR. STUCKY: No objection.

2 THE HEARING OFFICER: Exhibit 10 will  
3 be admitted.

4 BY MR. McLEOD:

5 Q. Mr. Pajor, part of the information that was  
6 presented to the legislative committee within  
7 that Exhibit 10 had to do with the original  
8 purpose and function of the ASR Phase I project  
9 as it was related to these chloride migration  
10 issues. Can you explain that for us.

11 A. Yes. Phase I in particular of the ASR project,  
12 was intended and designed to create a barrier to  
13 reduce the migration of the Burrton chloride  
14 plume towards the vicinity of the City's well  
15 field, and that's, that was and is its primary  
16 purpose.

17 Q. Is that original purpose part of the reason that  
18 the City's current proposal doesn't contemplate  
19 withdrawal of AMCs from the Phase I recovery  
20 wells or any adjustments to the lower index  
21 levels for those Phase I facilities?

22 A. Yes, that's correct.

23 Q. The USGS report we marked as Exhibit 11, dating  
24 from 2014, is it the most recent USGS report  
25 that you are aware of concerning migration in

1 the area of the oil field?

2 A. Yes.

3 Q. Does the basic point of the reported effort is  
4 to figure out chlorides have been living under  
5 existing conditions and what would happen under  
6 various alternative conditions?

7 A. That's correct.

8 Q. Looking back at pages 70 and 71 of the report  
9 have the authors set out their summary of what  
10 they did and the conclusions that they reached?

11 A. They have.

12 Q. Was part of it to model the baseline scenario  
13 based on the existing pumping and recharge for  
14 the study period?

15 A. Yes, it was.

16 Q. Did they also model the scenario with no pumping  
17 to determine what would happen if the chlorides  
18 were not influenced by any well operations?

19 A. Yes.

20 Q. What other alternative pumping and recharge  
21 scenario did they simulate?

22 A. They simulated a double pumping, in which the  
23 Wichita municipal pumping would be doubled, and  
24 existing irrigation scenario would continue.

25 And they also had a double Wichita pumping with

1 no irrigation pumping scenario.

2 Q. Did they model a scenario with additional ASR  
3 recharge?

4 A. Yes, they did.

5 MR. STUCKY: I will pause here and say  
6 I think the document speaks for itself as far as  
7 what these authors concluded. I mean, if the  
8 witness doesn't have expertise on these  
9 subjects, then I don't think we need to read  
10 from this particular document. If the expert  
11 has some sort of expertise on the subject matter  
12 of this expert report, then I suppose he can  
13 testify to what's in it. But if it is merely  
14 reading this document, it's already admitted in  
15 to evidence.

16 MR. McLEOD: After we do go through the  
17 conclusions, that were reached by the modelers,  
18 I would like to ask Mr. Pajor a couple of  
19 questions about them, and I think that  
20 developing it in his testimony is an easier way  
21 than just putting it in the record in the  
22 document and having people read it later.

23 MR. STUCKY: I will withdraw the  
24 objection, subject to later foundation. Go  
25 ahead and proceed, Mr. McLeod.

1 MR. McLEOD: And I am certainly trying  
2 not to read any expansive material myself on the  
3 report.

4 BY MR. McLEOD:

5 Q. Mr. Pajor, in any of the modeling scenarios did  
6 the chloride stop moving towards the well field?

7 A. No.

8 Q. In the no pumping scenario did the Burrton plume  
9 chlorides in the upper layer actually move  
10 toward the well field 120 feet per year faster  
11 than the baseline scenario?

12 A. Yes, that's correct.

13 Q. And in that same scenario, was the chloride  
14 movement from the Arkansas River slowed at all?

15 A. No. It was not.

16 Q. What about the scenario where they model doubled  
17 the City's existing municipal pumping?

18 A. In that case the chloride moved from the river  
19 and from the Burrton salt plume towards the well  
20 field.

21 Q. What was the change in the rate of movement?

22 A. Simulated chloride plume from the river near the  
23 southern end of the well field moved north  
24 toward and into the well field at approximately  
25 810 feet per year in layer 1, 150 feet per year

1 faster than in the baseline scenario; 870 feet  
2 per year in layer 2, 90 feet per year faster  
3 than in the baseline scenario; and 740 feet per  
4 year in layer 3, 80 feet faster per year than in  
5 the baseline scenario.

6 Q. So in that modeling we are talking about an  
7 adverse impact for chloride migration, but it is  
8 expressed by the authors its speed per year of  
9 movement. Correct?

10 A. That's correct. And similar study for the  
11 Burrton chloride plume.

12 Q. And if that went on for a period of eight years  
13 we would still be talking about feet per year;  
14 is that correct?

15 A. Yes.

16 Q. Did the report also ultimately conclude that the  
17 Burrton plume will continue moving towards the  
18 well field area regardless of pumping activity  
19 and that other alternatives may ultimately be  
20 needed to deal with that?

21 A. Yes, it did.

22 Q. Would the total city pumping that was projected  
23 in the 1% drought in the table 2.5 in the  
24 proposal, result in a pumping of the magnitude  
25 that's assumed in the double pumping

1 simulations?

2 A. I don't know.

3 MR. McLEOD: I don't have further  
4 questions for the witness.

5 THE HEARING OFFICER: DWR.

6

7 CROSS EXAMINATION

8 BY MR. OLEEN:

9 Q. Mr. Pajor, I want to clarify something about my  
10 understanding in the City's Exhibit Number 1,  
11 the proposal itself. Table 2-5. Once you have  
12 had a chance to locate that.

13 A. (Witness reviews documents). Okay.

14 Q. Do I understand that, sir, that this table 2-5  
15 lists the modeled inputs and variables by  
16 particular, well, by each of the years of the  
17 simulated eight year prolonged drought; is that  
18 correct?

19 A. Yes, that's my understanding.

20 Q. And so the row that says total EBWF & ASR (AF),  
21 is that a combination of the City's estimated  
22 modeled usage of both what I will call, quote,  
23 native water rights and ASR recharge credits?

24 A. Yes, that's correct.

25 Q. And by native, by quote, native water rights, to

1 be clear for the record, when I say that, I mean  
2 the City's five, quote, normal groundwater  
3 rights in the aquifer. Is that your  
4 understanding of my usage of the term?

5 A. Yes.

6 Q. Okay. So then looking, well, let me back up.  
7 Do I understand then that in order to determine  
8 the number of recharge credits that the model  
9 estimated would be used in each of the eight  
10 years, you always subtract 40,000 from the  
11 numerical view in the row that says EBWF & ASR  
12 (AF)?

13 A. That's correct, because that is, as you have  
14 characterized, our native rights each year.

15 Q. And under this model simulation, it was assumed  
16 that the City would use its entire 40,000 acre  
17 feet of native water rights first, before  
18 proceeding to use any recharge credits, if it  
19 even needed to; is that correct?

20 A. Yes, sir, that is correct.

21 Q. So, for example, then, because in the same row  
22 we have been talking about, total EBWF, year  
23 one, we never exceed the 40,000 acre feet so the  
24 City, under this model simulation, was able to  
25 meet its needs entirely from the native water

1 rights; and, thus, there is a zero in the row  
2 below indicating that no recharge credits were  
3 needed to be used that year; is that correct?

4 A. That is correct.

5 Q. This is a long way of me trying to confirm what  
6 I think is a typo in one of these particular  
7 boxes. And that is, if you look in year five,  
8 the row for total EBWF & ASR (AF), gives a  
9 figure of 56,579 combined native and recharge  
10 credits used; is that correct?

11 A. Correct.

12 Q. The row then below, that also corresponds to  
13 that year five, states that there would,  
14 therefore, be 15,552 recharge credits. Well,  
15 let me rephrase that. Sorry.

16 That out of that total 56,579 acre feet  
17 used in year five that 15,552 are recharge  
18 credits. Is that what it is saying?

19 A. That's what the table is presenting, yes.

20 Q. But am I correct that that should actually be  
21 16,579 recharge credits used in that particular  
22 year?

23 A. That would be my correction also.

24 Q. And it would appear to me, in comparing those  
25 two rows, doing my quick math, that that is the

1           only year for which there is a typo on the  
2           actual recharge credits estimated it would need  
3           to be used, is that your understanding?

4       A.    Yes, from reviewing those two rows I would  
5           agree.

6                       MR. STUCKY:  One objection here.  We'll  
7           certainly stipulate there is a typo on this  
8           table, and we have the same thing; but I guess  
9           the objection is, I don't know if this witness  
10          has any expertise as to how these calculations  
11          were generated and whether or not the witness  
12          can render an opinion as far as which number is  
13          incorrect in that particular column of the  
14          table.

15                      MR. OLEEN:  If it would appease Mr.  
16          Stucky I will phrase my question in the terms of  
17          a mathematical question, as opposed to Mr. Pajor  
18          stating that he knows for a fact that that's why  
19          there is a numerical difference.  Or if Mr.  
20          Stucky just wants to stipulate there is a typo  
21          and agree with what Mr. Pajor has said we can  
22          move on.

23                      MR. STUCKY:  I will stipulate there is  
24          typo or incorrect number of some sort.

25                      MR. OLEEN:  Thank you.

1 BY MR. OLEEN:

2 Q. So now that I understand Mr. Pajor, that that's  
3 a typo, the point though in looking at the sum  
4 of all the boxes in this table 2-5, the row that  
5 says City of Wichita ASR credit pumping, do I  
6 understand that, that that row shows that there  
7 is 50 some thousand recharged credits that the  
8 City anticipates would be, would need to be used  
9 over an eight year period such as this?

10 A. Yes.

11 Q. And so that is the total amount over eight years  
12 and in no singular year would anywhere near  
13 120,000 be proposed to be used, according to  
14 this table?

15 A. That is correct.

16 MR. OLEEN: No further questions.

17 Thank you.

18 THE HEARING OFFICER: Thank you. Mr.  
19 Stucky.

20 MR. STUCKY: Thank you.

21

22 CROSS EXAMINATION

23 BY MR. STUCKY:

24 Q. All right, Mr. Pajor, I am going to ask a few  
25 follow-up questions on your testimony. First of

1 all, when you started your testimony you  
2 indicated that you have served on the Equus Beds  
3 Groundwater Management Boards; is that correct?

4 A. Yes.

5 Q. And you indicated that as part of your board  
6 duties sometimes you would have to consider an  
7 analysis on impairment; is that right?

8 A. Yes.

9 Q. And would it also be correct that as far as  
10 whoever conducted the analysis on the impairment  
11 it would have been the staff of the Groundwater  
12 Management District, would that be a true  
13 statement?

14 A. That is correct.

15 Q. As you are sitting here today, you personally  
16 didn't generate or conduct any analysis on  
17 impairment, would that be a true statement?

18 A. Yes, it would.

19 Q. And, likewise, you said that as part of your  
20 duties sitting on the groundwater management  
21 board that sometimes you look at permits or  
22 applications. Do you recall that testimony?

23 A. Yes, I do.

24 Q. Would it actually be a correct statement to say  
25 that by the time it gets to the Board level for

1 the Board to consider, and we are actually  
2 looking at appeals, would that be a true  
3 statement? We are looking at appeals of initial  
4 applications?

5 A. I am not certain that that would always be the  
6 case.

7 Q. But most of the time, would that be the case?

8 A. I think most of the time, that would be the  
9 case.

10 Q. All right. Now, you also testified as to your  
11 credentials. As I listened carefully, is it  
12 true that you don't have any education or  
13 experience in hydrology; is that correct?

14 A. Yes, it is.

15 Q. And is it also correct that you don't have any  
16 education or experience in hydro geology?

17 A. Also correct.

18 Q. And is it also correct that you don't have any  
19 personal experience as far as with modeling,  
20 when it comes to conducting models or running  
21 models, would that be a true statement?

22 A. Yes, it would.

23 Q. So when it comes to any kind of technical  
24 conclusions or aspects of the City's proposal,  
25 that would be outside of the realm of your

1 expertise, would that be a true statement?

2 A. Yes, it would.

3 MR. STUCKY: Just so we have a clean  
4 record here, since the benefit of this hearing  
5 is for the public to hear all the testimony, and  
6 not be misled by any kind of conclusions that  
7 are made, I would ask that any kind of opinions  
8 that were, that focused on any kind of technical  
9 conclusions in the City's proposal be stricken  
10 and the witness' testimony.

11 THE HEARING OFFICER: I would prefer to  
12 have a specified request. So if there are  
13 particular questions and answers that you would  
14 like stricken, I would like to know which ones.

15 MR. STUCKY: Any kind of testimony as  
16 far as the future benefits to the aquifer,  
17 whether or not water quality would be impacted,  
18 things of that nature, I would ask that it be  
19 stricken.

20 THE HEARING OFFICER: I know some  
21 objections you made were to future foundation,  
22 which I assumed meant future witness foundation.  
23 Was I wrong on that?

24 MR. STUCKY: It would be subject to  
25 future foundation. That's correct. That a

1 future foundation can be laid, but our opinion  
2 is that there was no opinion for this witness to  
3 reach those ultimate conclusions.

4 THE HEARING OFFICER: So I am confused.

5 MR. STUCKY: Sorry, I hadn't had a  
6 chance at that point to voir dire the witness to  
7 his full conclusions in that regard and now I  
8 have had that opportunity.

9 THE HEARING OFFICER: I understand.  
10 But what I was thinking was that you were  
11 requesting was that your objections would be  
12 contingent on future foundation being  
13 established by other witnesses. Was I wrong  
14 about that?

15 MR. STUCKY: We'll leave the objection  
16 in that regard and I will proceed.

17 THE HEARING OFFICER: I am not trying  
18 to direct you in a different position, but I  
19 don't want to be ruling on a blanket request of  
20 a general subject description. If I am going to  
21 be willing to strike particular questions and  
22 answers, then I need to know exactly which ones  
23 we are talking about.

24 MR. STUCKY: I will walk through it.

25 THE HEARING OFFICER: You can do that

1 or come back to that if your future foundation  
2 doesn't happen, or however you want to handle  
3 it. I want to give you a fair process with  
4 that.

5 MR. STUCKY: I will walk through it.

6 BY MR. STUCKY:

7 Q. Now, to start out, you talked about your  
8 testimony, and I am trying to find the exhibit.  
9 I think it was Exhibit 11.

10 MR. STUCKY: Was Exhibit 10 the  
11 testimony that was delivered; is that correct?

12 BY MR. STUCKY:

13 Q. Okay. I ask that you flip to Exhibit 10 and  
14 that's in your testimony it is in the black  
15 binder under the green tab.

16 A. I have it.

17 Q. Okay. Now, on the first page of that particular  
18 exhibit, I believe admitted in to evidence, was  
19 this blue cover sheet (indicating).

20 A. Correct.

21 Q. And then after that I see that there was some  
22 question and answers. Was that also introduced  
23 as part of your testimony?

24 A. To the legislative committee?

25 Q. Yes.

1 A. No, it was not.

2 Q. Do you have any knowledge as far as the  
3 conclusions that is rendered in those question  
4 and answers?

5 A. I have knowledge of them, I have read them. I  
6 participated in the review of them.

7 Q. Well, let's walk through them just a little bit  
8 mirror. First question is, says, why is the  
9 City pursuing these changes now. I would ask  
10 that you walk to the bottom of that question and  
11 answer, second sentence from the bottom it says:  
12 Higher aquifer levels at the beginning of a  
13 drought means the impact would be less severe  
14 and fewer wells will dry up. Does that language  
15 assume that with the City's approach there is  
16 the possibility that at least some wells could  
17 dry up?

18 MR. OLEEN: I am sorry to interrupt,  
19 Mr. Stucky, it was not my understanding that  
20 this document was part of the exhibits brought  
21 in.

22 THE HEARING OFFICER: I can't even find  
23 it.

24 MR. OLEEN: I don't think it was, but I  
25 could be mistaken.

1 MR. McLEOD: It was not part of the  
2 exhibit. I don't mind counsel asking questions  
3 about did and if he wants to offer it, that's  
4 fine, too.

5 MR. STUCKY: I will offer it  
6 independently. I would like to go ahead and  
7 offer it as exhibit.

8 (Exhibit 12 was marked for  
9 identification by the Reporter.)

10 MR. STUCKY: I am going to move to  
11 formally introduce Exhibit 12.

12 THE HEARING OFFICER: Any objections?  
13 No. Exhibit 12 will be admitted.

14 BY MR. STUCKY:

15 Q. To go back to my question, it says higher  
16 aquifer levels at the beginning of the drought  
17 means the impact will be less severe and fewer  
18 wells will dry out. And that's under these  
19 statements as far as the justification for the  
20 city pursuing changes with the ASR; is that  
21 correct?

22 A. Yes. This was done as part of our public  
23 outreach to make public aware of why we were  
24 asking for the changes and what those changes  
25 were.

1 Q. Does that statement assume under the City's  
2 proposal at least some wells could dry up, is  
3 that what that's assuming?

4 A. No. That's pointing out the fact that without  
5 the changes that we are pursuing there is an  
6 increased risk of wells drying up because we'll  
7 have lower aquifer levels because we have to  
8 draw the aquifer down under our existing permit  
9 conditions to create physical recharge credits.

10 Q. Do you have any opinion or expertise or  
11 testimony as far as whether any wells will dry  
12 up during the withdrawal of aquifer maintenance  
13 credits during a drought? Do you have any  
14 opinion on that?

15 A. No, I do not.

16 Q. Okay. I would like you to flip to Page 4 of  
17 that particular document. In the fourth  
18 paragraph from the second sentence it says: The  
19 recharge credits do not renew, they go away when  
20 they are either pumped or when they seep out of  
21 the basin storage area. So is it correct that  
22 at least some of the ASR credits will seep out  
23 of the aquifer?

24 A. Some of the ASR credits will seep out of the  
25 aquifer, yes, it's true of today's permit and it

1 is true in under this proposal.

2 Q. Do you have any knowledge or expertise as to how  
3 those percentages would be calculated as far as  
4 the seepage would look like?

5 A. It would be part of the annual reporting  
6 process.

7 Q. Did you help conduct that annual accounting?

8 A. No.

9 Q. I would like to move back to Exhibit 10, which  
10 was your testimony on March 1st, 2018. On the  
11 second page of that testimony it refers to, it  
12 refers to an average of 88% of the saturated  
13 thickness and to 80% of the saturated thickness  
14 and that's referring to if the minimum index  
15 level is lowered, is that what that testimony is  
16 referring to?

17 A. Yes, it is.

18 Q. Do you have any knowledge or expertise as to how  
19 those percentages were arrived upon?

20 A. Do I have any knowledge or expertise?

21 Q. Yes. Did you help to do the analysis --

22 A. No, I did not.

23 Q. -- to get to those percentages?

24 A. No.

25 Q. Okay. As you were sitting here today you would

1 not necessarily be able to defend those  
2 particular percentages; is that correct?

3 A. Personally?

4 Q. Yes. Personally.

5 A. No.

6 Q. I want to back up to actually the prior page of  
7 this testimony, and it says that on about the  
8 second full paragraph it says, and I am sorry,  
9 second page of the testimony, my mistake, Mr.  
10 Pajor, second page of the testimony, under the  
11 second full paragraph it says: ASR was  
12 originally intended to accomplish three  
13 objectives. Do you see where I am reading?

14 A. I do, yes.

15 Q. And in the third, can you read for the record  
16 the third objective. As you wrote it there.

17 A. Work to reduce the extent of the hole that had  
18 been created in the Equus Beds in the vicinity  
19 of the 55 square miles of the City of Wichita  
20 well field. This hole resulted from over  
21 appropriation in this area prior to the  
22 establishment of safe yield practices for the  
23 granting of water rights in the Equus Beds  
24 aquifer.

25 Q. So, first of all, would you acknowledge the fact

1           that the area of the City's well field is over  
2           appropriated?

3       A.    Yes, I would.

4       Q.    And, second of all, would you acknowledge the  
5           fact that safe yield calculations, and safe  
6           yield practices, are a good practice in the  
7           aquifer?

8       A.    Yes, I would.

9       Q.    I am going to ask you to flip a little further  
10          in that notebook to your next testimony, which  
11          was on January 23, 2018.  It is in that black  
12          notebook.

13      A.    That's where I thought I was.

14      Q.    There is --

15      A.    You were in the house and I am in the senate  
16          now.

17      Q.    Yes.

18      A.    You want me to go to the senate?

19      Q.    That's correct.

20      A.    Okay.

21      Q.    Are you on that document now?

22      A.    Yes, sir.

23      Q.    Now, toward the very bottom of that document it  
24          says that our current forecast for water demands  
25          from our customers for the next 50 years is

1           considerably different than what was projected  
2           in the early 1990s. Is that a true statement?

3       A.    I am sorry. You are at the end of the  
4           testimony?

5       Q.    End of the first page of the testimony.

6       A.    (Witness reviews documents). Correct. Correct.

7       Q.    So let's talk just a moment about projections of  
8           water in the 1990s. First of all, would you  
9           acknowledge that the projections that were made  
10          in the 1990s for the demands of water for the  
11          City turned out to be off base? In other words,  
12          they were incorrect in the projections?

13      A.    I would not characterize them that way, no.

14      Q.    Let me ask you this, do you have any opinion as  
15          far as whether or not the projections were on  
16          track in the early 1990s? Or is it your  
17          testimony that the projections made in the early  
18          1990s for future water requirements of the City  
19          were correct? Which is your testimony?

20      A.    That they were correct in the sense that that  
21          was the analysis using the available data at  
22          that point in time when those projections were  
23          done. They are certainly different than the  
24          projections of today. That's the point of the  
25          sentence.

1 Q. Well, first of all, would you acknowledge that  
2 for the purposes of the City's model, the  
3 projections that have been made, that have been  
4 made for the City's water need are important?  
5 Would you acknowledge that?

6 A. Yes, I would.

7 Q. So how did you come up, did you have any opinion  
8 or expertise as far as how the City came up with  
9 its projections for future water needs based on  
10 medium growth in the proposal?

11 A. Do I have any --

12 Q. Do you have any knowledge or expertise as far as  
13 how that was calculated or how you came up with  
14 the City's future water needs?

15 A. Not the particulars of the calculation, just the  
16 general description of the scenarios and the  
17 methodology that was used, yes. But I did not  
18 make the calculations.

19 Q. And just a moment ago you indicated that the  
20 City is going to need approximately 60,000 acre  
21 feet of water. Was that your testimony?

22 A. I believe I said 50, I would go with 60 just as  
23 being closer.

24 Q. And what was the basis for that number? I guess  
25 I was unclear with how you calculated or derived

1           that number.

2       A.    I added up the ASR acre footage that we used  
3           over the protracted drought that was in the  
4           table that we looked at.

5       Q.    And once again, with respect to that particular  
6           table you didn't help to create that table or  
7           you didn't help to make the calculations that  
8           led to that table; is that correct?

9       A.    That is correct.

10                       MR. STUCKY:  Let's go to Exhibit 1, the  
11           proposal itself.  Exhibit 8, since nothing was  
12           numbered we are having trouble finding the  
13           exhibits.  May I approach?

14           BY MR. STUCKY:

15       Q.    I will move to a different line of questioning,  
16           we are trying to locate the particular exhibit.  
17           Okay.  Let's move back to the proposal.  Can you  
18           turn to figure 12 in the proposal.

19       A.    (Witness complies).

20       Q.    Which is on Page 3-3.

21       A.    Okay.

22       Q.    Just a moment ago you rendered some opinions as  
23           far as trends that are shown on that particular  
24           table; is that correct?

25       A.    Yes.

1 Q. Did you help to calculate any of this data or  
2 help create this table?

3 A. No, I did not.

4 Q. Now, the red, the red shows city artificial  
5 recharge of groundwater, is that correct on this  
6 table, those on this table. The thick red line  
7 at the very bottom.

8 A. Thick red line at the bottom, not the reddish  
9 brown line.

10 Q. The red line above it, shows estimated  
11 groundwater use for agricultural irrigation from  
12 study area; is that right?

13 A. Yes, it is.

14 Q. I think a moment ago you testified that it your  
15 view that irrigation use has gone up based on  
16 your opinion on this particular graph, is that  
17 what you testified to?

18 A. Yes.

19 Q. Have you done any further analysis on this  
20 particular graph to reach that conclusion? In  
21 other words, have you tried to further average  
22 out what this trend shows over time with the  
23 straight line or any kind of analysis of that  
24 nature?

25 A. No, I have not.

1 Q. So your testimony just a moment ago was based  
2 solely on your opinion having just glanced at  
3 this table; is that correct?

4 A. On a simple read of it, yes.

5 Q. Okay. And is it also true that this table ends  
6 in the year 2013?

7 A. It appears to me to go further than 2013.

8 Q. Okay. But at the very least --

9 A. But barely past 2013, yes.

10 Q. So it doesn't have at least the last three or  
11 four years of data; is that correct?

12 A. Correct. Correct.

13 Q. And I think you already answered this, but as  
14 far as how the 120,000 acre feet was calculated,  
15 as far as a cap for the city, you didn't help to  
16 come up with that particular number?

17 A. That is correct.

18 Q. And so you don't have a specific opinion as to  
19 whether or not that's a viable cap, is that  
20 true?

21 A. I do have an opinion whether or not that's a  
22 viable cap, yes.

23 Q. Is it based on your experience and expertise in  
24 your opinion?

25 A. It's based on my review of those experts' work.

1 Q. But once again, you didn't perform any personal  
2 analysis or calculations on deriving that cap?

3 A. That is correct.

4 Q. You talked a little bit about 2011 and 2012  
5 data. And you indicated that the City didn't  
6 use credits during that particular drought; is  
7 that right?

8 A. Yes.

9 Q. And do you have any knowledge, as far as from a  
10 planning perspective, why that occurred?

11 A. Why we didn't use the credits?

12 Q. Yes.

13 A. We didn't see a need to use them.

14 Q. And why was that?

15 A. We did not use our full 40,000 acre feet, is my  
16 understanding.

17 Q. And you also indicated that during the years  
18 2011 and 2012 that you didn't go below the 1993  
19 levels, the aquifer didn't fall below the 1993  
20 levels; is that right?

21 A. Correct.

22 Q. Is it true that in the years 2011 and 2012 the  
23 Little Arkansas River dried up?

24 A. I couldn't testify to that.

25 Q. Okay.

1 A. I don't have that information.

2 Q. In your earlier testimony you talked about  
3 different solutions that the city could  
4 potentially use for its future water demands.  
5 Do you recall that testimony?

6 A. Yes, I do.

7 Q. And you indicated that one particular  
8 alternative was to use water from El Dorado  
9 reservoir. Do you recall that testimony?

10 A. No, sir, I don't. I recall two alternatives for  
11 using water from El Dorado.

12 Q. Two particular alternatives. One was to treat  
13 the water and one was to take untreated water  
14 from the El Dorado reservoir, were those the  
15 two?

16 A. To purchase treated water from El Dorado, yes.

17 Q. What was the reason why it would be so expensive  
18 to treat that particular water before it's used  
19 by the City?

20 A. That would be a question for the City of  
21 El Dorado's water utility.

22 Q. Is it possible to divert the water from  
23 El Dorado reservoir to the City and treat it  
24 within the city limits?

25 A. That was the raw water purchase option that we

1 evaluated.

2 Q. Does the City currently have the capability of  
3 treating that water within its city limits?

4 A. Yes.

5 Q. And so I guess my question is, on that table it  
6 indicated a significant difference between  
7 taking the raw water and taking the treated  
8 water from El Dorado reservoir. So I guess my  
9 question is, if the City has the capability of  
10 treating that water currently, why is there such  
11 a significant cost difference?

12 A. I don't have that answer.

13 Q. Fair enough. Now, in your purple notebook, in  
14 your purple notebook it's under the green tab  
15 it's called strategic plan.

16 A. (Witness reviews documents).

17 Q. Are you at that particular tab?

18 A. Yes.

19 Q. If you could flip with me one, two, three, four,  
20 five pages in to that particular document, and  
21 there is a document called Water Supply  
22 Planning. Do you see that document?

23 A. Yes.

24 Q. And on that particular document, it's about the  
25 third page of that document on Page 3 of that

1 water supply document. Do you follow where we  
2 are at?

3 A. Yes.

4 Q. Now, on this document it indicates that  
5 originally the City was considering nine options  
6 to meet its future water needs. Is that a true  
7 statement?

8 A. Yes, it is.

9 Q. Aside from El Dorado reservoir, you mentioned  
10 two options, and one was treated water from  
11 El Dorado reservoir and one was raw water from  
12 El Dorado reservoir. So that's two of the nine  
13 options. And I believe a third option was  
14 aquifer maintenance credits. What were the  
15 other six options that were considered by the  
16 City?

17 A. I am sure I cannot recall all six. One option  
18 was to take water from Cheney Reservoir to the  
19 ASR plant, treat it and inject it. I don't  
20 recall the other.

21 Q. Now, on that same particular page, on Page 3, so  
22 as you are sitting here today you don't have any  
23 recollection as far as whether or not those, why  
24 those other six options were discounted?

25 A. That's correct. But we, I do recall going

1 through a very deliberative process of creating  
2 that long list and whittling it down to the  
3 three we got to.

4 Q. Toward the bottom of that particular page it  
5 says treated El Dorado water as one of the  
6 options that was considered; is that right?

7 A. Yes.

8 Q. It says in that particular paragraph that if  
9 \$250 million were allocated to this project, the  
10 remaining funds would be used to prepay water  
11 purchase cost. So, in other words, does that  
12 language assume that taking water from El Dorado  
13 reservoir would actually cost less than \$250  
14 million?

15 A. No. This language comes from the proposed sales  
16 tax that would have generated more revenue  
17 during the time that it was in effect, than the  
18 water purchases that we would be making from  
19 El Dorado. So we would be making, we would be  
20 using that revenue from the proposed sales tax  
21 to purchase water for future delivery. That's  
22 what that sentence refers to, is my  
23 recollection.

24 Q. Okay. On the next page there is a table where  
25 it refers to coming up with the total of \$250

1 million to pay for water from El Dorado  
2 reservoir on that very next page; is that  
3 correct?

4 A. Yes.

5 Q. So what this document is purporting to show is  
6 that the cost to get water from El Dorado  
7 reservoir would cost the City roughly \$250  
8 million?

9 A. That's what the table indicates, yes.

10 Q. Now, I want to turn back to the previous page,  
11 the previous page it talks about ASR  
12 improvements that could be made. On the  
13 previous page under ASR improvements it says:  
14 Making those ASR improvements would require also  
15 \$250 million to cover the infrastructure cost;  
16 is that correct?

17 A. For that improvement.

18 Q. So at least what this document shows is that the  
19 cost of getting water from El Dorado reservoir  
20 and the cost of making those ASR improvements is  
21 roughly equal, would that be a true statement?

22 A. That's what the document indicates. It does not  
23 speak to the availability of the water.

24 Q. You have, as you indicated before, you served on  
25 the Equus Beds Groundwater Management Board and

1 I think you are familiar with the concept of  
2 multiyear flex accounts; is that correct?

3 A. Yes, I am.

4 Q. Did the City ever consider the possibility of  
5 using multiyear flex accounts as a planning  
6 resource, or a planning tool, to meet needs  
7 during a drought?

8 A. Yes.

9 Q. And if that option was considered why was that  
10 option not used or why was that option  
11 discounted in the City's analysis?

12 A. It was determined not to be workable.

13 Q. Why was it determined not to be workable?

14 A. I don't recall.

15 Q. Do you have any idea who would have testimony as  
16 far as why the multiyear flex account wasn't  
17 workable?

18 A. No, I don't.

19 Q. So as you are sitting here today, you know the  
20 MYFA was considered but it was discounted but  
21 you are not sure why, is that true?

22 A. It was discussed, that's right, it was  
23 considered.

24 Q. But as you are sitting here today you are not  
25 sure why it was discounted; is that correct?

1 A. It didn't work, but I don't know the details. I  
2 did not participate in the calculations.

3 Q. Okay. Is it possible for the city to, currently  
4 with the infrastructure the City has, is it  
5 possible for the City to recharge the aquifer  
6 and pump to the City at the exact same time as  
7 your infrastructure currently exists with  
8 respect to your recharge facility?

9 A. We have operational restrictions as to be able  
10 to do both of those at the same time.

11 Q. Now, what are those operational restrictions?

12 A. I cannot describe them accurately in detail.

13 Q. Theoretically if those operational, well, if the  
14 infrastructure was changed with respect to your  
15 recharge facilities, if that infrastructure  
16 would change, would it be possible to recharge  
17 the aquifer and also pump to the City at the  
18 same time, if that infrastructure was changed?

19 A. I don't believe I have the credentials or  
20 experience to speculate on an answer to that  
21 question.

22 Q. Let me ask you this, did the City ever analyze  
23 or try to consider what kind of costs would be  
24 involved in changing the infrastructure to allow  
25 the City to recharge at the same time that it's

1           pumping water to the city? Was that ever  
2           discussed by you?

3       A.    Not by me.

4       Q.    Has the City considered putting in to place  
5           additional recharge basins in the Equus Beds  
6           well field?

7       A.    Yes.

8       Q.    And why has that not occurred at this juncture?

9       A.    It's not something we are pursuing at the  
10           moment. It's something that we are still  
11           considering.

12      Q.    Okay.

13      A.    I am not sure how to answer beyond that.

14      Q.    If I were to, so has that been discussed to your  
15           knowledge at City Council meetings or anything  
16           of that nature at this juncture or has it just  
17           been discussed internally?

18      A.    I do not recall it being discussed at City  
19           Council meetings, that doesn't mean it hasn't  
20           been.

21      Q.    I am going to circle back to some earlier  
22           projections that were made by the City. And I  
23           believe all of our exhibit notebooks are up  
24           there; is that correct? We have an exhibit  
25           notebook and it's volume 6 in our, of our

1 exhibit notebooks. Do you have that document is  
2 in front of you?

3 A. Yes, I do.

4 Q. Circle back to our conversation a moment ago  
5 about future projections. In this particular  
6 document I ask that you flip to page 39. It's  
7 labeled as document 78 in our notebooks. And if  
8 I had told you that this was the testimony of  
9 David Warren with the City during ASR Phase I  
10 would you have reason to disagree with me?

11 A. I could neither confirm nor deny that.

12 Q. And, in fact, on page 39 there is a question  
13 about in the middle and it says: Mr. Warren,  
14 how does the City of Wichita water utility rank  
15 in terms of size with other cities in the State  
16 of Kansas? So at least as that question exists,  
17 does it appear that that question was being  
18 asked to David Warren?

19 A. It certainly appears that way.

20 Q. I would like to go to the last answer on that,  
21 could you read that answer on the bottom of page  
22 39?

23 A. As part of our study of water supply, of course  
24 you have got to look at demand projections. In  
25 the water supply plan there was a water demand

1 projection made in 1993 as a part of that  
2 report, and it projected that by 2050 the city's  
3 average day demand would be about 125 million  
4 gallons a day, and the maximum day demand would  
5 be about 250 million gallons a day. The City  
6 updated those demand in 1997 as a result of  
7 the --

8 Q. Proceed to the next page.

9 A. -- implementation of the water rate structure  
10 that I mentioned previously in this testimony.  
11 At that time, we adjusted those demands, and the  
12 average a day 2050 demand was down to about 112  
13 gallons a day, and the maximum day demand was  
14 down to about 225 million gallons a day. 2003,  
15 which was the most recently complete year that  
16 we have records for, the average day demand for  
17 Wichita was 55 million gallons a day, and the  
18 maximum demand was 107 million gallons per day.

19 I will mention that subsequent to that  
20 year --

21 Q. You can pause.

22 A. Thank you.

23 Q. Would you agree then that at least in the early  
24 1990s the projections made by the City as far as  
25 future water demands would change, would you

1 agree with that?

2 A. This appears to indicate that, yes.

3 Q. And I think a moment ago you indicated that  
4 water use by the City, since the early 1990s,  
5 has not significantly changed, was that your  
6 testimony?

7 A. Correct.

8 Q. But your model indicates that water use in the,  
9 by the City in the future, will be based on  
10 projected medium growth; is that right?

11 A. Yes.

12 Q. And so would you agree that based on what we  
13 have learned from this testimony, and what we  
14 have learned from the past, that trying to  
15 predict water use in the future is purely  
16 speculative, at best?

17 A. No.

18 Q. Would you agree that it's something, that they  
19 are projections we are guessing as to the future  
20 and it's not an exact science, would you agree  
21 with that?

22 A. I would characterize it as a forecast.

23 Q. And it's impossible to predict a forecast  
24 perfectly; is that right?

25 A. Yes, that's correct.

1 Q. And, in fact, in the past when the City made  
2 forecasts, as far as future water needs as  
3 indicated by that testimony, at least, those  
4 forecasts turned out to be incorrect; is that  
5 right? At least as that testimony indicates.

6 A. Yes.

7 Q. Now, I would like you to also flip in our  
8 exhibit notebooks to notebook Number 1.

9 A. (Witness reviews documents).

10 Q. Would you flip to what's labeled as Exhibit  
11 Number 7 in those notebooks, or at least tabbed  
12 as Number 7 in those notebooks.

13 A. Yes.

14 Q. Would you agree with me that this particular  
15 document is titled, The City of Wichita's  
16 Responses to Equus Beds Groundwater Management  
17 District Number 2 First Request For Admissions  
18 City of Wichita. Would you agree that that is  
19 what that document purports to be?

20 A. Yes.

21 Q. Now, in this particular document if we flip  
22 toward the end of the document. As you look  
23 through that document did you review those  
24 requests for admissions before they were  
25 provided to the district?

1 A. Quite possibly. I don't have a clear  
2 recollection of having done so. But it's quite  
3 possible.

4 Q. Now, I would ask that you flip to page number 7  
5 of that particular document. I am sorry. To  
6 question number 14 on that particular document.  
7 It says, admit or deny that there is not a  
8 definition of AMC or aquifer maintenance credits  
9 or statute or regulation. And the answer to  
10 that is admit. Would you agree with that?

11 A. Yes, sir.

12 Q. As you are sitting here today, would you also  
13 agree there is no statute or regulation that  
14 defines an aquifer maintenance credit?

15 A. Yes, sir.

16 Q. Would you also agree --

17 MR. McLEOD: I will object to asking  
18 the witness questions about laws and  
19 regulations. I think the hearing officer  
20 indicated she'll take judicial notice of laws  
21 and regulations and it's completely cumulative.  
22 The witness has no specific expertise to testify  
23 to laws and regulations.

24 BY MR. STUCKY:

25 Q. In your expert report you referred, subject to

1           what Mr. McLeod just said, in your expert report  
2           you talked about how AMCs are a functional  
3           equivalent of aquifer maintenance or ASR  
4           credits. Is that what you put in your report?

5           A. Yes.

6           Q. And just a moment ago Mr. McLeod said you have  
7           no experience in interpreting statutes and no  
8           experience in determining what the law should be  
9           in that regard. Did you hear the objection from  
10          Mr. McLeod a moment ago, or response a moment  
11          ago?

12          A. Yes, I did.

13          Q. Would you agree, based on what Mr. McLeod just  
14          said, it would be outside the scope of your  
15          expertise to render an opinion as to whether or  
16          not an aquifer maintenance credit is a  
17          functional equivalent of a different type of  
18          recharge credit. Would you agree with that?

19          A. Could you restate the question?

20          Q. To determine whether or not an aquifer  
21          maintenance credit is the functional equivalent  
22          of a traditional recharge credit, one would have  
23          to have, one would have to construe the statutes  
24          and regulations to reach that conclusion; is  
25          that correct?

1 MR. McLEOD: That in and of itself  
2 calls for a legal conclusion from the witness.  
3 It's quite possible Mr. Pajor only meant to  
4 suggest with the use of functional equivalent  
5 the two types of credits do the same thing.

6 Q. I guess my question is, do you have any legal  
7 training or expertise that based, that you base  
8 your conclusion, that you based your conclusion  
9 of functional equivalent on in your report?

10 A. No.

11 Q. Would you agree that with respect to strictly  
12 the accumulation of aquifer maintenance credits,  
13 that as aquifer maintenance credits are  
14 accumulated, no source water would be put in to  
15 the aquifer?

16 A. Yes.

17 Q. And would you also agree that with the use of  
18 aquifer, as aquifer maintenance credits are  
19 accumulated, strictly with respect to  
20 accumulating aquifer maintenance credits, there  
21 would be no physical recharge of the aquifer  
22 that would occur. Would you agree with that?

23 A. Yes.

24 Q. So, in fact, with respect to an aquifer  
25 maintenance credit, the City is asking for a

1 credit for water that's not pumped out of the  
2 aquifer, is that essentially what it is? Or  
3 pumped in to the aquifer.

4 MR. McLEOD: I think that's become  
5 compound enough I would ask counsel to restate  
6 it.

7 MR. STUCKY: I will rephrase.

8 BY MR. STUCKY:

9 Q. The basis for an aquifer maintenance credit, and  
10 the reason the City is asking for a credit, is  
11 because the City is leaving water in storage in  
12 the aquifer, is that a true statement?

13 A. That's part of the reason.

14 Q. What is the other reason?

15 A. There is no room in the aquifer to put the  
16 physical water that we diverted from the river  
17 and treated at the treatment plant. At that  
18 point we only had two choices. Can't go in the  
19 ground, so that only leaves one choice. So it  
20 goes to town where it meets demand. Absent the  
21 ASR, absent the operation of the ASR, that  
22 demand has to be met with water withdrawn from  
23 the aquifer.

24 Q. So let me just walk through a gallon of water as  
25 an aquifer maintenance credit is accumulated.

1           You testified to the benefits of an aquifer  
2           maintenance credit a moment ago. So if a gallon  
3           of water is sent directly to the City, and one  
4           aquifer maintenance credit is accumulated, do  
5           you follow me so far?

6           A. Yes.

7           Q. That water, that one gallon of water would be  
8           used by the City for its municipal water supply;  
9           is that correct?

10          A. Yes, it is.

11          Q. And is what the City is then saying is at a  
12          later time when the City is asking to withdraw  
13          its aquifer maintenance credit for that one  
14          gallon of water, that the City would be allowed  
15          to then take another gallon of water from the  
16          aquifer at a later time. Is that what the  
17          City's proposal purports to do?

18          A. Yes. The gallon we did not remove on the day we  
19          started with to meet the demand of the customer.

20          Q. So just under my scenario, so I am clear, this  
21          gallon of water that is sent to the City would  
22          be used to meet the City's municipal water  
23          supply?

24          A. Yes. In lieu of the gallon out of the aquifer.

25          Q. And then later, because a credit is generated

1 under the aquifer maintenance credit for that  
2 same gallon of water, the City would also be  
3 able to take an additional gallon of water out  
4 of the aquifer at a later time; is that correct?

5 A. No, we are taking the gallon of water we didn't  
6 take out at the beginning of your transaction,  
7 because we didn't have to take it out because we  
8 produced it with the ASR.

9 Q. So you are saying in the future no water would  
10 be taken out of the aquifer?

11 A. We would take the gallon we didn't take at the  
12 beginning of your analysis.

13 Q. So just in a strict sense, would you take  
14 another gallon of water out of aquifer later?

15 A. No. We would take the gallon we did not take  
16 out at the beginning of your analysis.

17 Q. So no water would come out of the aquifer at a  
18 later time under the aquifer maintenance  
19 credits?

20 A. Yes, the gallon would come out. It would be the  
21 gallon we did not take out at the beginning of  
22 your analysis.

23 Q. So, in other words, and I understand how you are  
24 characterizing it; but, in other words, for each  
25 gallon of water that's sent to the City, the

1 water, the City can then take an additional  
2 gallon of water out of the aquifer because it  
3 was left in storage; is that correct?

4 A. No. I disagree with your characterization as  
5 additional. It's the gallon we did not take at  
6 the time we had the original demand because we  
7 were able to meet demand with an alternative  
8 source.

9 Q. Okay. Let me just ask this quite simply. If  
10 one gallon of water is used, one gallon of water  
11 would be used in the City; is that right?

12 A. Okay.

13 Q. Sent directly to the City. Could the City  
14 withdraw, later under an aquifer maintenance  
15 credit, a gallon of water out of the aquifer?

16 A. We could withdraw that gallon of water. Not an  
17 additional gallon. The gallon that was to meet  
18 the demand for that gallon that we didn't have  
19 to pull out and send on that day because we put  
20 the ASR water in to the pipeline to town.

21 Q. So the City later could take a gallon of water  
22 out of the aquifer?

23 A. That gallon that we did not take at the  
24 beginning.

25 Q. So is the answer yes in that regard?

1 A. My answer is, it's the gallon that we did not  
2 take out at the beginning of your analysis.

3 Q. But the City could take that gallon out later;  
4 is that correct?

5 A. Yes.

6 Q. Okay.

7 A. Because we did not take it out at the beginning.

8 Q. In ASR Phases I and 2, and especially in ASR  
9 Phase I, are you familiar with any of the  
10 conditions as they related to passive recharge  
11 credits?

12 A. Only very vaguely, very broadly.

13 Q. So as you are sitting here today would you have  
14 any opinion or testimony with regard to passive  
15 recharge credits? Would you have any knowledge  
16 or expertise as far as what qualifies as a  
17 passive recharge credit?

18 A. No.

19 Q. Do you believe that with respect to an aquifer  
20 maintenance credit, and just follow me for a  
21 moment. The City pumps 40,000 acre feet to the  
22 city, directly from the Little Arkansas River  
23 during it's overflow, and then later and then  
24 has 40,000 aquifer maintenance credits built up.  
25 Do you follow my hypothetical so far?

1 A. Yes, sir.

2 Q. After the City uses those 40,000 acre feet of  
3 aquifer maintenance credits, is it your opinion  
4 that the City should replace that water later?

5 A. I am not sure what you mean by replace that  
6 water. Have we loaned it from somebody?

7 Q. Replace its physical recharge credits. Should  
8 the City replace it with physical recharge  
9 credits.

10 A. My intention is to generate every physical  
11 recharge credit that we can, every day that we  
12 can.

13 Q. My question is this, if the City is to take out  
14 40,000 acre feet in aquifer maintenance credits,  
15 as far as a hypothetical goes, do you think it  
16 would be a good planning initiative and a good  
17 condition for your proposal to require the City  
18 to then replace that water with physical  
19 recharge credits or physical recharge in the  
20 future?

21 A. I am not sure that that, I am not sure that that  
22 would be appropriate.

23 Q. Okay. And why not?

24 A. Well, I am not sure where the claim comes from  
25 to require that. What is the reasoning to

1           require it? That we, I mean, that assumes that  
2           AMCs are not a functional equivalent of recharge  
3           credits.

4       Q.    Let's back up a little bit on your testimony.  
5           Sorry, it's a little harder for me to flip  
6           through documents. I apologize.

7                        You testified just a moment ago that  
8           part of the reason for the City's planning and  
9           the benefits that you touted with respect to the  
10          aquifer maintenance credit is based on the fact  
11          that if the minimum index level is lowered, the  
12          City could wait longer before it would have to  
13          claim any of its recharge credits. Is that what  
14          your testimony said?

15       A.    Absolutely.

16       Q.    Now, let me ask you this, is that, would the  
17          City wait to claim those recharge credits  
18          because it's part of good planning by the City?  
19          Or would it be required by the City? Is it a  
20          requirement?

21       A.    We would wait because we only want to be using  
22          those credits, the ASR credits, in the severe  
23          prolonged drought. And until it's severe and  
24          prolonged, we wouldn't want to use them. We are  
25          saving them for those very rare occasions.

1 Q. And I want to clarify though, the benefits that  
2 are derived from that, assume that the City  
3 would voluntarily choose to be a good steward of  
4 the aquifer. Is that an accurate statement?

5 A. I am not sure I understand your question.

6 Q. Well, let me ask it this way. There is no  
7 requirements in place that would dictate when  
8 the City would have to draw down the aquifer and  
9 when it couldn't draw down the aquifer, other  
10 than that minimum index level. In other words,  
11 it would be the City's decision whether or not  
12 to pump down the aquifer, is that a true  
13 statement?

14 A. Yes.

15 Q. And, in fact, if it's the City's decision on  
16 whether to pump down the aquifer, is it true  
17 that part of the benefits that are derived from  
18 the City's model assume that the City would make  
19 decisions and execute planning that would be  
20 consistent with sound aquifer maintenance and  
21 planning? Do you follow my question?

22 A. I do not. Would you just repeat it, I think I  
23 could follow it the second time.

24 Q. Okay. Do part of the benefits of the City's  
25 proposal have a baseline assumption that the

1 City is going to implement planning that would  
2 be best for the aquifer in its planning?

3 A. That's why we are here today.

4 Q. So, in other words, if you are to testify and  
5 say there will be benefits because if the  
6 minimum index level is lowered, we'll not have  
7 to pump the aquifer as soon. Those statements  
8 are based on the assumption that the City would  
9 pump out of the aquifer and choose to be a good  
10 steward of the aquifer only under those  
11 circumstances, is that true?

12 A. We intend to always be a good steward of the  
13 aquifer.

14 Q. And so, but let me ask you this, there is no  
15 requirement of the City, other than the  
16 requirements that are in ASR Phase I and Phase  
17 II, that specifically require the City to be a  
18 good steward of the aquifer, is that a fair  
19 statement?

20 A. And those are requirements that no other water  
21 rights holder has. No other water rights holder  
22 has that are in those permit conditions. If I  
23 am following the question.

24 Q. I think a moment ago you said that you don't  
25 have any testimony as far as whether or not an

1 aquifer maintenance credit is a passive recharge  
2 credit, that you didn't have any knowledge or  
3 expertise in that area; is that correct?

4 A. Yes.

5 MR. STUCKY: I don't have any further  
6 questions.

7 THE HEARING OFFICER: Miss Wendling,  
8 did you have questions for the witness?

9 MS. WENDLING: Yes.

10

11

CROSS EXAMINATION

12

BY MS. WENDLING:

13

Q. Going back to your strategic plan, I think it's  
14 Exhibit 9.

15

AUDIENCE MEMBER: Can you move the  
16 microphone closer.

17

Q. The strategic plan in Exhibit 9 is in the purple  
18 binder.

19

AUDIENCE MEMBER: It's not on.

20

MS. WENDLING: Is that better?

21

AUDIENCE MEMBER: Yes.

22

BY MS. WENDLING:

23

Q. So on Page 30 power slide 36 on that  
24 presentation.

25

A. Okay. I am there.

1 Q. So you have the cost comparison of the different  
2 plans and you have a cost figure for ASR?

3 A. Yes.

4 Q. Are those the costs associated with the AMC  
5 proposal?

6 A. No. These were costs that were associated with  
7 the alternative strategy of an additional  
8 storage of the surface water flow prior to  
9 treatment, as well as additional treatment or  
10 injection points for ASR.

11 Q. Does this PowerPoint presentation address the  
12 concept of the AMCs?

13 A. No. I do not believe it does.

14 Q. And it was this presentation of the strategic  
15 plan that was voted on by City Council and  
16 approved?

17 A. Yes, that's my understanding, is that this was  
18 part of a follow up to the presentation that was  
19 made to them in 2014 regarding strategic  
20 planning work that they had done on a number of  
21 subjects, including water supply.

22 Q. So the strategic plan that was approved at that  
23 point in time did not include AMCs?

24 A. That's my understanding.

25 Q. And did that proposal include a change to a

1 minimum index level?

2 A. I do not believe it did.

3 Q. You have talked a bit about the current  
4 situation where you believe the aquifer is too  
5 full that it cannot be, you cannot accumulate  
6 recharge credits, is that a fair  
7 characterization?

8 A. Yes, it is.

9 Q. What are some of the things that cause the  
10 aquifer to be too full that would prevent your  
11 physical recharge?

12 A. When we switched to our integrated water supply  
13 plan, excuse me, when we switched our emphasis  
14 to using more water to meet customer demand from  
15 Cheney Reservoir, and taking less of our native  
16 water rights, the 40,000 acre feet per year that  
17 we have in the Equus Beds, that contributed.  
18 Natural recharge contributed. Artificial  
19 recharge contributed. And it's possible that  
20 the changes and practices of other water right  
21 holders in the area could have contributed. I  
22 do not have knowledge of that directly.

23 Q. Other than the fullness of the aquifer, are  
24 there other limitations on your ability to  
25 perform physical recharge?

1 A. If I interpret your question to mean if that, if  
2 the, if the aquifer were not full would there  
3 still be limitations on producing physical  
4 recharge? Yes. There would be physical  
5 limitations of the treatment plant. There would  
6 be physical limitations of the treated water  
7 transmission, there would be treated injection  
8 point limitations, there would be raw water  
9 delivery from the river to the treatment plant,  
10 and there would be the raw water availability in  
11 the Little Ark. They would all be physical  
12 limitations. Today none of those come in to  
13 play as the limiting factor.

14 Q. Other than the raw water availability in the  
15 Little Arkansas, are those other limiting  
16 factors within the City's ability to improve?

17 A. Yes. We could build bigger treatment plant and  
18 we could build larger pipelines and we would  
19 still have the same existing bottleneck of a  
20 full aquifer. And we would have better delivery  
21 to that choke point.

22 Q. I believe you said you became involved with  
23 Phase II of the ASR project; is that correct?

24 A. Yes.

25 Q. And that was implemented about three years ago?

1 A. That was my guess.

2 Q. And a rough estimate of around 6,000 recharged  
3 credits accumulating?

4 A. No. I believe it's about 6,400 --

5 Q. Okay. Close enough.

6 A. -- acre feet.

7 Q. So if it's been three years, was ASR Phase II  
8 designed to meet your needs within three years  
9 or did it have a longer time horizon?

10 A. No. The original idea of the short-term  
11 transfer from wet years to dry years it would be  
12 operating within that timeframe. Within this  
13 new mission that we have for this plant and this  
14 project, it's a very long horizon, it is  
15 decades.

16 Q. You mentioned pumping to create space within the  
17 aquifer.

18 A. Yes.

19 Q. Are there alternatives to pumping that would  
20 create space in the aquifer?

21 A. Not that I am aware of.

22 Q. Is it your belief that the current, the alleged  
23 full state we are presently in, will continue  
24 indefinitely?

25 A. First of all, I am not sure what to do with the

1           characterization of alleged full state. I tried  
2           to explain earlier in my testimony that the  
3           final couple of percent of predevelopment level  
4           is difficult to achieve. I will tell you that  
5           at GMD2 board meetings the Board has had  
6           discussions about problems that people have had  
7           with wet basements because of high groundwater  
8           levels. I don't know what the alternatives  
9           would be.

10        Q. I will come up with a different question.

11        A. Okay.

12        Q. In your experience with water management, do  
13           you, have you experienced the aquifer at varying  
14           levels throughout your tenure with the City?

15        A. Yes.

16        Q. So sometimes it's high and sometimes it's low?

17        A. Well --

18        Q. Lower.

19        A. Well, figure 13 shows the recovery from '93 to  
20           2016. In the area of our well field that's all  
21           positive to extremely positive in terms of a net  
22           increase. Yes, there are variations. There are  
23           variations over time and over space within the  
24           well field and time.

25        Q. So one could assume that over time, even without

1 the City's current pumping, the aquifer would  
2 drop to a point where you would then again be  
3 able to accumulate physical recharge credits?

4 A. Oh, that's our strategy today. Our strategy  
5 today is we are now reemphasizing and  
6 prioritizing taking water out of the aquifer to  
7 draw the aquifer level down to create the  
8 physical space to put physical recharge credits  
9 in. That's what our current permit condition  
10 allows us to do. That's what we working on now.  
11 We certainly plan on it going down.

12 Q. As an alternative to the City intentionally  
13 pumping the aquifer down, is it also possible  
14 you could wait and over time the aquifer level  
15 would go down without the City having to force  
16 it down?

17 A. No, that doesn't meet our needs for protection  
18 from drought.

19 Q. I am not asking about your needs for drought. I  
20 am talking about your experience monitoring  
21 levels in the aquifer. Even without the city's  
22 pumping, the levels in the aquifer might go  
23 down?

24 A. Not as fast as if we worked to get it there.

25 Q. I am not asking about the speed, it's a

1           yes-or-no question. Will it go down without the  
2           city's pumping?

3       A.    I don't know.

4       Q.    So you have mentioned your current strategy of  
5           pumping intentionally to create space. I  
6           believe you also mentioned that you do not know  
7           when a drought will occur; is that correct?

8       A.    Yes, ma'am.

9       Q.    And you associated some risks with having a  
10          lowered or partially depleted state when we  
11          enter the drought; is that correct?

12      A.    Yes, ma'am.

13      Q.    So do you perceive risks with your current  
14          strategy of pumping a hole in the aquifer at  
15          this point?

16      A.    Yes, ma'am.

17      Q.    Have you quantified that risk?

18      A.    No. We haven't quantified it.

19      Q.    You have expressed a desire to keep the aquifer  
20          full, and you are being a good water steward; is  
21          that correct?

22      A.    Yes, ma'am.

23      Q.    However, in the proposal is there a limitation  
24          as to when to pump the AMCs?

25      A.    In our proposal that we are here today?

1 Q. Yes.

2 A. Yes.

3 Q. There is a limit?

4 A. Yes.

5 Q. What is that?

6 A. There are new bottoms defined for all of the  
7 index cells.

8 Q. Other than the index level, is there any other  
9 limitation on when the City would be allowed to  
10 pump AMCs?

11 A. If I am following your question, the answer  
12 would be no.

13 Q. So if you were no longer in your position and  
14 someone else were making decisions on pumping,  
15 who did not choose to be a good water steward,  
16 they could, in fact, pump those AMCs outside of  
17 a drought?

18 A. It is physically possible for me, or anyone  
19 else, to pump AMCs outside of a drought. AMC  
20 produced water is by far, by orders of  
21 magnitude, the most expensive water we have in  
22 our portfolio. We have no motivation to spend  
23 that in anything except a critical condition to  
24 our customers.

25 Q. You have also commented that the City's efforts

1 in reducing groundwater use, and relying more  
2 heavily on Cheney, have resulted in significant  
3 recovery to the aquifer. Is that a correct  
4 characterization?

5 A. Yes, correct.

6 Q. Can you explain what you mean by recovery?

7 A. Figure 13 on Page 3-4 of the City of Wichita's  
8 proposal shows the recovery from 1993 to 2016.  
9 That's the recovery.

10 Q. So is it accurate to say recovery is a higher  
11 water level?

12 A. Yes.

13 Q. And the City's decision to not pump has resulted  
14 in a higher water level?

15 A. Yes.

16 Q. But that's not the city physically adding water,  
17 aside from the limited physical recharge  
18 credits?

19 A. Correct. Which is figure 12.

20 Q. Very good. You mentioned, and I will tell you  
21 the figure, in your proposal benefits to every  
22 water source in the area as the result of this  
23 proposal; is that correct? I was joking. We  
24 don't really need the figure, you talked about  
25 benefits to all the water credits; is that

1 correct?

2 A. Yes. But I don't remember if that was  
3 successfully objected to or not.

4 Q. At this point I don't either. When you talk  
5 about these benefits, those benefits are  
6 associated with accumulation of credits; is that  
7 correct?

8 A. Yes.

9 Q. In the event the City pumped 120,000 acre feet  
10 over an eight year drought, that would not  
11 actually benefit the aquifer at that point in  
12 time, would it?

13 A. I am not sure I follow your question.

14 Q. So the City --

15 A. If pumping water is not benefiting the aquifer  
16 then every water rights user that's ever existed  
17 has done a disservice to the aquifer.

18 Q. I am trying to question what happens when the  
19 City actually uses the AMC, the point where you  
20 need to pump the AMCs out of the aquifer.

21 A. What happens is customer demand is, in spite of  
22 a 1930s level dustbowl area drought.

23 Q. And I want to think about the aquifer. The City  
24 would have the ability to pump 120,000 acre feet  
25 of AMCs over an eight year drought, if that were

1 to happen, what is the benefit to the aquifer at  
2 that point in time? Is this a benefit to the  
3 aquifer?

4 A. It has done its job. It has supplied water to a  
5 water rights holder. That's what, I mean,  
6 Kansas water law says that's what we are  
7 supposed to do, make economic use of the waters  
8 of the State of Kansas.

9 Q. You have also proposed to lower the minimum  
10 index levels. If during a drought, or if at any  
11 time, the water levels are dropped an additional  
12 ten feet to the new proposed minimum index  
13 levels, what benefit does that have to the  
14 aquifer?

15 A. I am not following your question. What is the  
16 benefit to the aquifer of a lower aquifer level,  
17 is that your question?

18 Q. Of allowing users to lower the aquifer to a  
19 lower minimum index level.

20 A. Well, the waters have been put to economic use.

21 Q. Does the proposal, as it stands, as it's  
22 written, require the City to continue engaging  
23 in physical recharging?

24 A. Our proposal that we are here on today?

25 Q. Yes.

1 A. Yes, we are making a commitment that if we could  
2 do physical recharge, that's our first highest  
3 priority of what to do with water produced by  
4 the project.

5 Q. And you have expressed that the physical  
6 recharge is the most expensive water out there  
7 for you to produce?

8 A. Yes.

9 Q. Now, the City has committed to physical  
10 recharge, but does the proposal, the words of  
11 the proposal, actually contain a requirement  
12 that the City engage in physical recharge?

13 A. That's my understanding.

14 Q. Are you able to tell me where in the proposal it  
15 says that?

16 A. No, I am not.

17 Q. Okay.

18 A. But that's our intention.

19 Q. Are you aware of any detriments to lowering the  
20 water levels to the newly proposed minimum index  
21 level?

22 A. Lower aquifer levels will adversely impact the  
23 chloride contamination that we talked about  
24 earlier. So if water levels are lower, the  
25 tendency of those plumes, in both the natural

1 and manmade, are going to move more, in general.

2 The USGS report shows there are exceptions.

3 Q. I believe you agreed the City is not restricted  
4 to using the AMCs at any time, you agreed to  
5 that, I believe.

6 A. Yes, I have. And I hope I made it clear that it  
7 doesn't make any sense. It's the height of  
8 irresponsibility to use it at times when you  
9 have free water available. I mean the water  
10 from our 40,000 acre foot native right is free.  
11 Why would we use the very expensive ASR water  
12 when we, if we haven't already used all of our  
13 native right?

14 Q. As a utility, as a water utility, you provide  
15 water to a number of customers and other  
16 municipalities; is that correct?

17 A. Yes. We have a number of wholesale customers  
18 and a number of customers that are served at  
19 retail outside of the city limits.

20 Q. And it's possible that you could take on a new  
21 customer in the future?

22 A. Well, yes.

23 Q. And it's possible that with that added customer  
24 you would exceed the demand of just the 40,000  
25 acre feet?

1 A. In order to draw that conclusion we would have  
2 to assume characteristics of this hypothetical  
3 new customers. I could tell you that because  
4 today, outside of the city limits, we are  
5 already serving 70,000 citizens of Kansas. If  
6 the customers that we serve outside of the city  
7 limits of Wichita, it would be a city that would  
8 be the seventh largest city in Kansas. We've  
9 already got that footprint. That's already  
10 built in to our planning. There is nobody  
11 outside of that footprint, of any significance,  
12 in terms of water consumption. You literally  
13 get to other municipalities. We are not going  
14 to be serving wholesale water to Hutchinson or  
15 serving wholesale water to Tulsa.

16 Q. You have a bottle of water sitting on the desk  
17 in front of you?

18 A. Yes.

19 Q. And bottled water is very popular these days.

20 A. Yes, it is. I brought my container with my tap  
21 water in it, but this was provided and I didn't  
22 want to be rude.

23 Q. It's possible that a new company could be your  
24 customer and they want to sell bottled water and  
25 that could be the increased demand, it doesn't

1 have to be municipalities; is that correct?

2 A. That's true. We have a very large bottled water  
3 customer that's our customer this afternoon.

4 Q. Love to here that's where my water is going.  
5 You could take on another customer which could  
6 increase the demand for water; is that correct?

7 A. Yes.

8 Q. And the AMCs could be used to meet that demand?

9 A. I understand that you are connecting those dots.  
10 I mean, the customer that we have got today is  
11 decimal dust on our utility. If we got ten of  
12 those it would not be a significant increase in  
13 our water demand. If we were running away from  
14 this proposal because of a fear that a lot of  
15 bottled water is going to cause the aquifer to  
16 go dry, no, I don't agree with that assertion.

17 Q. If we could turn back to the proposal, I believe  
18 it's Attachment A to your proposal. It is your  
19 drought response plan.

20 A. (Witness reviews documents).

21 Q. I believe you stated earlier that one of the  
22 goals is to avoid going in to stages 3 or 4 in  
23 the model 1% drought, is that my understanding?

24 A. Yes.

25 Q. Could you go to Page 6, the plan which talks

1 about the actions in stage 3.

2 A. Yes.

3 Q. In the second bullet point on the right-hand  
4 column under the City of Wichita internal  
5 conservation, can you tell me what that is.

6 A. Reduce hours at city owned fountains.

7 Q. So if your goal is achieved we'll survive a 1%  
8 eight year drought with the City still running  
9 all their fountains?

10 A. I can't speak to the details of this. I am not  
11 recalling the details behind that bullet point.

12 Q. All right. On the left-hand column under  
13 utility customers, can you tell me what the  
14 third bullet point on the left says.

15 A. It says exceptions are provided for businesses  
16 generating economic activity directly from  
17 outdoor irrigation.

18 Q. Are you familiar with what types of customers  
19 that would be describing?

20 A. Yes. A golf courses, athletic fields, water  
21 parks.

22 Q. So during this modeled 1% drought we'll still  
23 have green golf courses; is that correct?

24 A. No. If we reach stage 3. Yes, in stage 3 they  
25 would still be exempted.

1 Q. And your goal is reaching stage 3?

2 A. Yes, it is.

3 Q. And the water parks will all still be up and  
4 running?

5 A. Yes.

6 Q. So if we flip back to Page 4 where we are at  
7 stage 2 of the drought response plan, under  
8 utility customers, the third bullet point on the  
9 left. Can you read that one?

10 A. Outdoor water usage prohibited from 10:00 a.m.  
11 until 8:00 p.m. on all days. It is not allowed  
12 at all on Saturdays, Sundays or Mondays.

13 Q. So utility customers would still be able to  
14 water their lawn weekly, even if we are at stage  
15 2?

16 A. Yes. Correct.

17 Q. And if we go back to the proposal itself, I  
18 believe it's table 2-5. Page 2-10.

19 A. I am there.

20 Q. I think you did the rough math earlier for the  
21 row of city pumping to be approximately 50,000.

22 A. Yes.

23 Q. And do you have any reason to anticipate your  
24 needs during the model drought would exceed that  
25 estimated 50,000?

1 A. No. This is, this is our best planning  
2 estimate.

3 Q. And the AMC's purpose is to provide water during  
4 a drought; is that correct?

5 A. Yes.

6 Q. You have no reason to assume that you would ever  
7 need the full 120,000 acre feet cap?

8 A. We might need it before we could reestablish  
9 enough for another drought. I mean, remember 1%  
10 probability drought does not mean it going to be  
11 hundred years until the next one. We all know  
12 that. So the 120,000 is a cap that provides for  
13 two of these severe droughts to be able to be  
14 banked in our credits.

15 Q. Okay.

16 A. And that compares to no cap this afternoon.

17 Q. In addition to being expensive, would you  
18 characterize the physical recharge credits as  
19 being somewhat difficult to obtain?

20 A. I think you could use the words expensive and  
21 difficult rather interchangeably, yes.

22 Q. And do you believe that AMCs will be easier to  
23 accumulate?

24 A. No. They are going to have the same cost to us  
25 either way. There is no price differential. It

1 is literally coming out of the river, going to  
2 the treatment plant, going through the treatment  
3 plant, coming out of the treatment plant, and  
4 either going into either physical injection or  
5 going to town. Our costs are the same.

6 Q. So when you spoke earlier about the difficulties  
7 of getting the last half gallon of gas in to  
8 your automobile and translated that in to the  
9 aquifer, with the AMC concept, that difficulty  
10 would no longer be present; is that correct?

11 A. The AMC concept allows us to reflect the fact  
12 that eventually you stop clicking on the pump,  
13 okay? Our first choice is still to create  
14 physical recharge water, always has been, always  
15 will be. But because of the nature of the  
16 aquifer, and the mounting around the recharge  
17 points, we are physically limited in our ability  
18 to get that water spread out over the very top  
19 of that aquifer without exceeding our ten foot  
20 restriction. In other words, we can't pump the  
21 water in as fast as the aquifer can accept it to  
22 spread it out in that last couple of percent of  
23 space that's available. So we have to actually  
24 over excavate the water with a cone of  
25 depression by drawing the water out to be able

1 to put that mounted water back in without  
2 breaking through that ten foot restriction,  
3 especially when we are getting down to that last  
4 2%. It's a finesse thing.

5 Q. And using the AMCs you no longer need that  
6 finesse?

7 A. Well, the finesse, it's not a matter of finesse.  
8 If we could finesse our way in, we will. We  
9 have finessed our way to the last couple of  
10 percent. At that point you just can't finesse  
11 any more. The aquifer is practically full. And  
12 we don't mean that as an approximate. We mean  
13 that there is not a practical way to get water  
14 back in.

15 Q. To your knowledge has the City looked at the  
16 amount of time it will take the aquifer to  
17 recover from the simulated drought?

18 A. I believe we have evaluated that. I have not  
19 participated in that. I don't have direct  
20 knowledge of it.

21 Q. Do you know who would have direct knowledge of  
22 it?

23 A. No. Not off the top of my head, I don't.

24 MS. WENDLING: I have no further  
25 questions.

1 THE HEARING OFFICER: Mr. McLeod, what  
2 do you think?

3 MR. McLEOD: I have some redirect. It  
4 is my understanding we committed to the church  
5 we would not stay after 5:00 o'clock and we are  
6 not in keeping with that at this moment.

7 THE HEARING OFFICER: That's true. So  
8 we better recesses until tomorrow morning.

9 MR. McLEOD: That would be my proposal  
10 to pick up with redirect tomorrow morning.

11 THE HEARING OFFICER: Okay. We'll see  
12 everybody tomorrow morning at 9:00 a.m.

13

1 P R O C E E D I N G S

2  
3 THE HEARING OFFICER: Good morning. We  
4 are now back on the record. It is December 11,  
5 2019. And it's 9:00 o'clock in the morning and  
6 this is day two of the formal phase of the  
7 public hearing for the City of Wichita's  
8 modification proposal regarding their Aquifer  
9 Storage and Recovery Project, Phase II. Before  
10 we get started with questioning, just a  
11 logistical thing that I need to put on the  
12 record regarding the marking of exhibits. The  
13 parties have agreed to have their exhibits  
14 marked with the party indication, as well as the  
15 number of their exhibits, so that each parties'  
16 exhibits will begin with Number 1.

17 So the City's exhibits from yesterday,  
18 numbered 1 through 12, and the court reporter  
19 has remarked them as City 1 one through City 12.  
20 And that's the way we will proceed from this  
21 point forward regarding the marking of exhibits.

22 Is there anything else that the parties  
23 would like to raise before we start? Okay.  
24 Hearing none, Mr. McLeod, we return to you.

25 MR. McLEOD: Okay. I think Mr. Pajor

1 should resume the seat of honor at the witness  
2 table being already under oath.

3 THE REPORTER: Is the mic on?

4 MR. McLEOD: Yes.

5

6 CONTINUATION OF REDIRECT EXAMINATION

7 BY MR. MCLEOD:

8 Q. Mr. Pajor, yesterday there continued to be  
9 questions several times in your direct about  
10 whether the City would use its 40,000 acre feet  
11 base rights before taking credits. That's  
12 actually a proposed permit condition, isn't it,  
13 in the proposal?

14 A. Yes, it is.

15 Q. And is it also a feature of our current ASR  
16 operations plant?

17 A. Yes, that's correct.

18 Q. It was mentioned by Mr. Stucky and you conferred  
19 with him that in the prior instances where you  
20 looked at permits and permit modification  
21 requests as a member of the GMD board, those  
22 analyses were done by the district staff. In  
23 each of those cases who had to make the ultimate  
24 decision on recommendations based on those  
25 analyses?

1 A. The Board of Directors of the district was  
2 responsible for the ultimate decision.

3 Q. And so as a board member you still had to read  
4 and understand those analyses and make a  
5 decision based on that?

6 A. That's correct.

7 Q. And that was part of the experience that you  
8 bring with you to the witness stand today?

9 A. Yes.

10 Q. On the issue of seepage and the imputation of  
11 seepage to AMCs, and indeed the physical  
12 recharge credits, you had given Mr. Stucky a  
13 general answer that you thought those seepage  
14 numbers came from the annual accounting reports.  
15 And my question for you today, to may be a bit  
16 more specific, when the chief engineer and  
17 Groundwater Management District review those  
18 accounting reports and the chief engineer issues  
19 ultimately an order saying what credits the City  
20 will get based on that annual accounting report,  
21 does the chief engineers order have appended to  
22 it a table that includes a column showing what  
23 net loss to the river is being recognized in the  
24 computation of those credits?

25 A. Yes, that occurs on an annual basis.

1 Q. So there is actually like a short government  
2 document in the order of the chief engineer in  
3 which those numbers on seepage can be drawn?

4 A. That's correct.

5 Q. Counsel asked you a question about whether you  
6 could say the 120,000 acre foot cap was a viable  
7 cap. I don't know that there was any definition  
8 given there as to what a viable cap was. Does  
9 the City have any cap currently on the  
10 accumulation of a credits?

11 A. No. Our current permit does not have any  
12 restrictions on a cap for credits.

13 Q. So what we know about the 120,000 acre foot cap  
14 is, is that it's more of a cap than it is  
15 currently; is that correct?

16 A. Yes, it would be new.

17 Q. On the discussion of demand projections, there  
18 was reference by counsel to a prior testimony by  
19 David Warren where Mr. Warren discussed updates  
20 of demand projections that have proven in the  
21 course of time not to match objective facts as  
22 they unfolded. Do you remember how long ago  
23 that testimony from Mr. Warren would have been?

24 A. No, I don't recall. A number of years ago  
25 certainly.

1 Q. In the course of making demand projections, I  
2 think you concurred with Mr. Stucky there is an  
3 element of speculativeness there, these are  
4 forward looking projections, correct, where you  
5 are looking out to the year 2060 to figure out  
6 what system demand might be?

7 A. That is correct.

8 Q. We have to recognize that inherently they may  
9 not turn out as projected; is that correct?

10 A. Correct.

11 Q. Does it follow from Mr. Warren having made an  
12 update to the projections because facts were  
13 unfolding differently than projected that the  
14 projections the City makes will always be wrong?

15 A. They will always have to be revised because the  
16 actual numbers will most likely be different  
17 than the forecasted.

18 Q. From a management perspective, is that something  
19 that regularly happens in using planning  
20 projections that you have to update them as you  
21 go through time?

22 A. Yes. Absolutely. And I think in the discussion  
23 that was had in the state process of developing  
24 the 50 year revision it was pointed out several  
25 times that municipal cities generally, Wichita

1 included, while we do 50 year projections we  
2 redo those projections every few years in order  
3 to refresh them based on actual information that  
4 we have acquired.

5 Q. And as much as a projection has to be changed,  
6 if it was just a bad projection, might a  
7 projection have to be changed if customer  
8 behavior changed or technology changed or rate  
9 structure changed in a way that caused customer  
10 to be different than what was projected?

11 A. Yes.

12 Q. There could be, in fact, information with a  
13 bearing on impact on demand that wasn't knowable  
14 or foreseeable at the time that the projections  
15 were first made; is that correct?

16 A. Yes. And we are also looking at the assumptions  
17 that we made previously and adjusting the  
18 magnitude of those assumptions to reflect actual  
19 experience.

20 Q. Is there a speculative element in all management  
21 planning?

22 A. Yes. Absolutely. And that's why it is  
23 important as we do that work when we are making  
24 those forecasts we are conservative in our  
25 assumptions. And for a water supply that means

1           ensuring that if our numbers are not going to be  
2           spot on that we have coverage with additional  
3           water; as opposed to, for example, sales  
4           revenues if we are not going to be spot on with  
5           revenues we want to be conservative and assume  
6           somewhat less revenues will be received.

7       Q.    Are sales revenues then another thing that the  
8           utility regularly projects?

9       A.    Yes.

10      Q.    And you have annual budget projection  
11           requirements that are imposed by the state; is  
12           that correct?

13      A.    That's right.

14      Q.    And you know all of those things are likely to  
15           come out different than the projections; is that  
16           correct, just because of the degree, number of  
17           years you are looking forward?

18      A.    Yes.  And I think anyone that's done a personal  
19           or business budget understands that the actuals  
20           after the fact is going to be different than the  
21           budget forecast.

22      Q.    So does it follow from the fact that they are  
23           likely to be different than projected that you  
24           just shouldn't do projections and plannings  
25           because they may not match what the facts turn

1 out to be?

2 A. Obviously we can't do that because we wouldn't  
3 have a basis for operating utility and making  
4 plans.

5 Q. So you are stuck with a degree of planning, even  
6 though it's imprecise, because you really can't  
7 run the utility without it?

8 A. Correct.

9 Q. As between city staff, who are running the  
10 utility, and staff of the Groundwater Management  
11 District, who are not, who is in the best  
12 position to make a guesstimate about projections  
13 for future years?

14 A. I would submit that the City of Wichita would  
15 be.

16 Q. If those projections turn out to be disastrously  
17 off, with operational consequences for the  
18 utility, who is going to get fired? Somebody  
19 from your staff or somebody on the Groundwater  
20 Management District staff?

21 A. Again, it would be the City staff who would be  
22 responsible to the elected officials and the  
23 city manager.

24 Q. There was some questions yesterday about  
25 alternatives the City might have pursued for

1 supplies from the City of El Dorado. In all  
2 such discussions, is there a party in the  
3 discussions other than the City?

4 A. Yes. The City of El Dorado.

5 Q. And so in terms of what can and can't be done,  
6 the City of Wichita has no unilateral say over  
7 terms of an arrangement; is that correct?

8 A. That's correct. We would have to have  
9 negotiated a mutual agreement.

10 Q. And there would be a need in the course of that  
11 to come to terms with whatever the City of  
12 El Dorado thought was in its best interest; is  
13 that correct?

14 A. Certainly.

15 Q. And I think it was mentioned as to all the  
16 El Dorado scenarios yesterday in your direct,  
17 that one of the issues was whether the City of  
18 El Dorado could, in fact, promise the City of  
19 Wichita firm supply in the event of a drought?

20 A. Yes. Because the City of El Dorado, to the best  
21 of our knowledge, had never pursued their water  
22 supply plan assuming a 1% probability drought.  
23 And, therefore, we had to do that work in order  
24 to determine whether or not we would be  
25 comfortable that water would be there. And our

1 analysis showed it would not be available, most  
2 likely.

3 Q. And did we try to get any assurances from the  
4 City of El Dorado about the availability of that  
5 water?

6 A. We did. And we were unsuccessful at securing  
7 that.

8 Q. In terms of the City operating fountains and  
9 such things during stages of drought  
10 restrictions, Mr. Pajor, is the City's drought  
11 response plan a plan, the details of which are  
12 posed on the City by some authority?

13 A. No. The City's drought response plan was  
14 entirely voluntarily developed by city staff and  
15 adopted by the City Council.

16 Q. And to your knowledge, do any of the other users  
17 in the Equus Bed well fields have a similar  
18 drought arrangement that they follow?

19 A. Not to my knowledge.

20 Q. You were asked a question yesterday I believe by  
21 Mr. Stucky about multiyear flex plans, and you  
22 had a distant recollection of a discussion that  
23 you weren't sure when it had occurred. If you  
24 would look in lime binder behind the tab  
25 responses and find the City of Wichita responses

1 to Intervenors' interrogatories to the City of  
2 Wichita, Kansas.

3 (City Exhibit City 13 was marked for  
4 identification by the Reporter.)

5 BY MR. McLEOD:

6 Q. Flipping back through that set of  
7 interrogatories and answers, Mr. Pajor, do you  
8 see where the City was asked by the Intervenors  
9 to talk about whether, and to what extent, it  
10 had modeled to the proposal, some kind of  
11 alternative for multiyear flex plans.

12 A. (Witness reviews documents).

13 Q. And if you were to start on Page 9 of those  
14 responses, that might assist you in getting  
15 there.

16 A. (Witness reviews documents). When I look in the  
17 City of Wichita's responses to Equus Beds  
18 groundwater first request for admissions?

19 Q. No. You are looking for City Responses to  
20 Intervenor's interrogatories. It may be a  
21 little further back.

22 A. (Witness reviews documents). It's actually  
23 towards the end of that tab section, the  
24 Intervenor's answers are the later material in  
25 that section. (Witness reviews documents.) City

1 of Wichita responses to Intervenor's production  
2 request?

3 Q. You are probably getting near.

4 MR. McLEOD: May I approach the  
5 witness, Madame Hearing Officer?

6 THE HEARING OFFICER: Yes.

7 Q. I think that's it (indicating).

8 A. I am there. Thank you.

9 Q. Okay, Mr. Pajor, and do you see looking on Page  
10 9 at the Intervenor's interrogatory number 19  
11 that the City, that they had propounded a  
12 question, if the City contends that a multiyear  
13 flex account would not meet the City simulated  
14 water needs assigned to the Equus Bed well field  
15 in ASR in table 2-3 of the proposal, please set  
16 forth any facts and identify any related  
17 documents which you rely upon to support such a  
18 contention.

19 And then after objecting in a lawyerly  
20 way, we went on to provide an answer and in the  
21 course of that answer you had to participate in  
22 a discussion about multiyear flex accounts at  
23 that time, didn't you?

24 A. Yes.

25 Q. And looking at that answer it begins at the

1 bottom of Page 9 and continues over on to the  
2 following Page 10, does that refresh your  
3 recollection about the substance of that  
4 discussion?

5 A. Yes, it does.

6 Q. And the reasons why multiyear flex accounts were  
7 not good solutions for the City's water needs?

8 A. Yes.

9 Q. And what were those problems, or at least the  
10 ones that were identified at that time in that  
11 discussion with trying to use a multiyear flex  
12 account for those purposes?

13 A. We relied upon and provide in our response that  
14 we consulted with the DWR staff, and the  
15 Division of Water Resources, had not proposed  
16 multiyear flex accounts as an alternative for  
17 us. And they had advised that they would not  
18 consider such an account as being viable.

19 In addition, we found that the multiyear  
20 flex account would likely not be helpful in our  
21 modeling of a drought, or working our way  
22 through a model drought, because multiyear flex  
23 accounts require term permits be issued to  
24 replace the base water rights during suspension.  
25 Therefore, all pumping, including the quantity

1 under the 40,000 acre feet, what we referred to  
2 yesterday as our native rights, would be junior  
3 to most surrounding water rights. Duration of  
4 the multiyear flex account is five years and the  
5 1% drought, as we modeled it, exceeds the five  
6 year time, it runs approximately eight years in  
7 duration.

8 The water quality and the water use  
9 flexibility would be excessively restricted,  
10 current statute prescribes a maximum allotment  
11 of five times the average water use from 2000 to  
12 2009. During the period 2000 to 2009 the City's  
13 average water use was much less than our  
14 permitted 40,000 acre feet. Thus, the multiyear  
15 flex account would greatly reduce the water  
16 supply available below the existing water rights  
17 that provide for 40,000 acre feet per year, our  
18 native rights, as we have referred to it.

19 In addition, statute allows for the  
20 examination of different calendar years where,  
21 quote, water conservation reduced water use  
22 under the base water right. End quote. But  
23 even if that quandary was granted consideration  
24 under the water conservation provision the 5x of  
25 the City's base water rights of \$40,000, with

1 the exemption of drought year one, every year we  
2 need more water than the 40,000 in order to meet  
3 customer demand during the 1% drought.

4 For those reasons it was deemed it was  
5 not feasible to use multiyear flex accounts.

6 Q. Although the City, in fact, not modeled that in  
7 its original proposal, and not addressed it in  
8 its original proposal, your recollection that  
9 you had yesterday, that you looked at that,  
10 there were problems with it, this flushes out  
11 the detail of that?

12 A. Yes.

13 MR. McLEOD: I will offer the  
14 interrogatory responses of City's 13 for  
15 admission.

16 THE HEARING OFFICER: Any objection?

17 MR. STUCKY: No objection.

18 THE HEARING OFFICER: City's Exhibit  
19 Number 13 will be admitted.

20 BY MR. McLEOD:

21 Q. Mr. Pajor, the references, let me actually just  
22 back up here and have you do a simple overview  
23 of current ASRs and what the City is asking to  
24 change in the permit modifications. Currently,  
25 and as originally designed, how does the ASR

1 system work? What was it supposed to do?

2 A. The original approach for ASR was that during  
3 periods of sufficient flow, permit sufficient  
4 flow, in the Little Arkansas River we would  
5 divert part of that high flow event, we would  
6 treat that water to drinking water standards in  
7 our dedicated water treatment plant for the  
8 project and we would inject that water through a  
9 combination of injection wells and injection  
10 basins in to the aquifer to be able to generate  
11 credits that could be used in future years, in  
12 addition to our native water right. That was  
13 the original concept.

14 So water that was available in wetter  
15 years would be able to move to provide a source  
16 of supply for water in dryer years.

17 Q. Okay. And was there an index level set for the  
18 basin storage area below which the City would  
19 not be allowed to withdraw credits?

20 A. Yes, there was, and it was basically the levels  
21 of the aquifer in 1993.

22 Q. And when those conditions were first set, that  
23 would have been in conjunction with the ASR  
24 Phase I project; is that correct?

25 A. Yes.

1 Q. And what was the water source for ASR Phase I?

2 A. The water source for ASR Phase I is water from  
3 the Little Arkansas River above a permanent  
4 level of flow.

5 Q. And what was one of the main purposes of  
6 injecting that water in to the aquifer in Phase  
7 I?

8 A. Phase I and Phase II are fundamentally different  
9 in that Phase I is dedicated specifically to  
10 improving the hydraulic barrier of the Burrton  
11 chloride plume as it migrates towards the City's  
12 well field and other users' well.

13 Q. And when the 1993 levels were made, the lower  
14 limit, I think you had indicated that was just  
15 drawn from the low measurements of record.

16 A. Yes.

17 Q. Was there a connection between that and that  
18 purpose of keeping a hydraulic barrier in front  
19 of the Burrton chloride plume?

20 A. Well, I think the concept was as that was  
21 depleted in the aquifer and vicinity; and,  
22 therefore, it made sense everyone would  
23 understand the project was supposed to keep  
24 water above that level. And in Phase I that  
25 continues to be our objective.

1 Q. So basically if we weren't keeping water above  
2 that level, we weren't establishing or  
3 maintaining a hydraulic barrier?

4 A. We were not providing benefit from the project  
5 in terms of the Burrton chloride.

6 Q. How did ASR Phase II differ?

7 A. ASR Phase II has the same water source, the  
8 Little Arkansas River higher flows. It differs  
9 in that the intention was that that water would,  
10 indeed, be recovered originally on a regular  
11 basis, today on a very sparse basis to address  
12 drought response.

13 Q. And what are the permit modifications asking to  
14 change in the operation of the current ASR?

15 A. We are seeking these permit changes because two  
16 fundamental things changed over the course of  
17 the ASR project. The first is, the aquifer was  
18 recharged from its 1993 levels to nearly, or  
19 very nearly, functional full to predevelopment  
20 conditions. That's a major change in condition.

21 The second major change in condition  
22 that we have been talking about is our forecast  
23 of future customer demands for water. And as  
24 those have changed over the course of time, when  
25 we made those changes, we now see that the only,

1 quote-unquote, new water we need, the only water  
2 we need in addition to our annual native rights  
3 from Cheney reservoir and the Equus Beds well  
4 field, is water during severe drought. So ASR's  
5 mission today is to become that water supply for  
6 those rare, but severe, protracted drought  
7 conditions to meet a portion of the customer  
8 demands that our native rights in our water  
9 sources do not meet.

10 Q. And to help facilitate that, what are the two  
11 main areas of change that the proposed  
12 modifications would make?

13 A. In order to transition ASR from its original  
14 vision to the 1% drought response, we need to do  
15 that in a way that makes maximum use of the  
16 recovery of the aquifer that we have had. And  
17 also allows us to accumulate these credits over  
18 decades for these rare periods where we will  
19 need to use them.

20 Therefore, we have requested a way to  
21 generate credits from treating water in the  
22 Little Arkansas River, even though the aquifer  
23 is full, to be able to leave the aquifer full by  
24 taking those credits and using them to displace  
25 water that otherwise would have come from the

1 aquifer on that day to meet customer demand of  
2 our utility. We'll leave the aquifer full,  
3 we'll generate the water with our plant, we'll  
4 meet customer demand with it.

5 The second request we are making is  
6 that we be able to hold these precious expensive  
7 credits that we are generating over the course  
8 of an extended timeframe, so that we only use  
9 them if we are, indeed, in a long term  
10 protracted drought. We don't need them in a two  
11 year drought. But if we have to use them before  
12 they became stranded, because of the current  
13 bottom of the area in which we can store  
14 credits, that's what we are forced to do. And  
15 we don't want to use them prematurely, we want  
16 to hold them.

17 Q. And, Mr. Pajor, with respect to the term and  
18 phraseology functional equivalent which has been  
19 used in the proposal, and also bandied about in  
20 answers yesterday, when you say that the aquifer  
21 maintenance credit is a functional equivalent of  
22 the existing credit, are you trying to give some  
23 kind of legal opinion there?

24 A. No.

25 Q. Explain what you are getting at when you say

1           that the credits would be a functional  
2           equivalent.

3       A.    I am describing it operationally.  I am  
4           describing the water that comes out of the  
5           Little Arkansas River, gets treated through our  
6           treatment plant.  At that point it comes out of  
7           the treatment plant.  Our first choice of what  
8           to do with that water is to put it in to one of  
9           the recharge points and put it physically in to  
10          the aquifer.  Only at times in which that isn't  
11          physically possible to do, and instead we take  
12          that water directly to the meet customer demand  
13          and leave water, if we didn't have this plant,  
14          leave water that we would be pulling out of the  
15          aquifer so that we can use it at a future time,  
16          rather than using it at the time when ASR is  
17          running.

18       Q.   So under the current ASR operation to generate a  
19           credit you would have to deplete the aquifer and  
20           then refill it to a degree of, using counsel's  
21           example of yesterday, if you wanted to get  
22           credit, physical recharge credit, for a gallon  
23           of water you would have to go deplete the  
24           aquifer by a gallon of water, and then draw from  
25           the river, treat and inject a gallon of water.

1 And then in addition to refine the hypothetical  
2 from yesterday, there is a leakage factor there  
3 as well, that has to be accounted for?

4 A. Yes. All of that is true. And as I said in my  
5 testimony yesterday, it isn't remove a gallon to  
6 inject a gallon, we have to remove more than a  
7 gallon to make enough space to put that gallon  
8 in because of the nature of the recharge  
9 process.

10 Q. So we actually lose a little ground there?

11 A. We lose net ground in terms of water levels and  
12 physical water and storage in the aquifer.

13 Q. So the difference with the AMC is, instead of  
14 having to empty the aquifer and then put a  
15 little water back in to get the credit, you just  
16 leave the water?

17 A. That's correct.

18 Q. And to demonstrate, I don't have a gallon but I  
19 have this little bottle that's here on counsel  
20 table. As you are sitting here in the room do  
21 you know if this has just been sitting there all  
22 morning untouched by me or if I drank this and  
23 emptied the bottle about five to nine and  
24 refilled it from a water source?

25 A. No, I wouldn't know.

1 Q. Because the bottle of water is full either way,  
2 right?

3 A. Yes.

4 Q. And when you say that the credits are functional  
5 equivalents, is it just that factual scenario  
6 that they do the same thing that you are  
7 getting?

8 A. Yes.

9 Q. There was a criticism, a question actually,  
10 directed I think as a criticism yesterday, that  
11 the proposal, as written does not, cannot  
12 withdraw of credits to give anyone else  
13 direction over the City's withdrawal. So it  
14 would only be the City's decision when to draw  
15 those credits. Do you recall that line of  
16 questioning?

17 A. Yes, I do.

18 Q. Isn't that true now, Mr. Pajor, with respect to  
19 the physical recharge credits that the City has?

20 A. Yes, it is true.

21 Q. And isn't it also true with respect to the  
22 40,000 acre feet based rights that the City has  
23 in the well field?

24 A. That's correct.

25 Q. And yet even though it's the City's decision,

1           totally discretionarily on subject, of course,  
2           to permit conditions, when to draw under those  
3           rights, the aquifer is full today, isn't it, Mr.  
4           Pajor?

5           A.    Yes, very nearly.

6           Q.    Can you think of any reason why the City that  
7           has left the aquifer full, despite having  
8           decisional control on where to draw credits and  
9           its space rights, would suddenly choose to just  
10          simply draw down the aquifer for no reason  
11          connected to need?

12          A.    No, that wouldn't be in our physical interest,  
13          it wouldn't be in our economic interest, it  
14          wouldn't be appropriate.

15          Q.    You were asked yesterday whether factors, other  
16          than city pumping from the aquifer, and I think  
17          you indicated in your direct response that you  
18          weren't really aware of factors other than  
19          pumping. To refine that, pumping by other  
20          parties certainly could deplete the aquifer,  
21          even if the City was not pumping, wouldn't it?

22          A.    Yes.

23          Q.    And it would still be pumping, it would still  
24          consistent with your answer, it just wouldn't be  
25          the city's pumping; is that correct?

1 A. Correct.

2 Q. Is there a reason that the city would want to  
3 get in to that relationship, where if the party  
4 is putting water in to the aquifer, and then  
5 waiting for everybody else to draw it, in order  
6 to deplete it for physical recharge?

7 A. That would not be in our economic interest at  
8 all.

9 Q. And I think you had also indicated that timing  
10 wise there would be a problem in that the City  
11 taking that posture, it would take a long time  
12 for the levels to be pulled down enough for  
13 recharge?

14 A. Yes. It certainly would.

15 Q. And you were asked about limits on when the City  
16 could pump aquifer maintenance credits, and as  
17 such, and I think you indicated there are no  
18 temporal limits in the permit that say when the  
19 City can draw those credits; is that correct?

20 A. That's right.

21 Q. But you had alluded to an annual limit during  
22 direct that there is a restriction on what the  
23 City can take out in any kind of credit. Even  
24 our current physical recharge credit in any  
25 given year, so that restriction would apply,

1 correct?

2 A. Yes.

3 Q. And also, as we mentioned at the start of your  
4 redirect, there would be an impact from the  
5 City's concurrence with the condition and the  
6 point in the KSA operational plan, that we'll  
7 have to draw 40,000 acre feet in base rights  
8 first?

9 A. Yes.

10 Q. So it's not expressed in the permit conditions  
11 as a temporal restriction, but there will be an  
12 annual restriction on what we can take and it  
13 will have to be only after the 40,000 acre feet  
14 in base rights are drawn, whatever that means  
15 for the calendar?

16 A. Yes.

17 Q. Mr. Pajor, you don't have before you, or you do,  
18 you have the District exhibit books. Please  
19 turn to tab 15 in the District exhibit books.

20 MR. McLEOD: And I will give a document  
21 to the reporter to mark as Groundwater  
22 Management Districts 15.

23 (GMD Exhibit 15 was marked for  
24 identification by the Reporter.)

25 MR. McLEOD: Let me offer that for

1 admission.

2 THE HEARING OFFICER: Any objections?

3 No. The District's GMD 15 will be admitted.

4 BY MR. McLEOD:

5 Q. Mr. Pajor, you were having difficulty recalling  
6 yesterday the extent of that limit on what the  
7 City can take out in a year and physical  
8 recharge credits. The document before you I am  
9 going to represent is a supplemental response by  
10 the Department of Water Resources to a question  
11 that the District had asked them in discovery.  
12 And if you review that response you see a  
13 reference by the Division of Water Resources in  
14 there about what was that annual availability to  
15 take credits is?

16 A. Yes.

17 Q. And what is it?

18 A. 19,000 acre feet.

19 Q. Okay, I just wanted to get that into the record  
20 for completeness. Ms. Wendling had asked you  
21 some questions yesterday about lower index  
22 levels, and it seemed to me that you might have  
23 gone astray and answered her about lower water  
24 levels instead. She had asked you, for example,  
25 what is the benefit of lowering the 1993 index

1 levels. Focusing on the index levels, what is  
2 the benefit of lowering the index levels?

3 A. With lower index levels for recovery of our  
4 water, we'll be able to avoid pulling credits to  
5 avoid stranding them during a drought at the  
6 beginning of the early years of a drought,  
7 because we don't know what the drought duration,  
8 nor intensity, is going to be over time. So if  
9 we had lower levels to which we could recover  
10 those recharge credits, we could hold those  
11 recharge credits to match the need that we  
12 anticipate in later years of the drought from  
13 our modeled 1% drought event.

14 Q. And then on the flip side of that, I believe  
15 also with intent to inquire about the index  
16 levels, Ms. Wendling had asked you whether we  
17 were aware of any detriments of lowering the  
18 index levels?

19 A. Well, lowering the index levels don't provide a  
20 detriment, they provide a benefit because they  
21 reduce the frequency with which we'll be  
22 withdrawing the recharged credits.

23 Q. In the rare case, for purposes of what has been  
24 discussed at the hearing so far, the 1%  
25 exceedance drought, where the City actually has

1 to pump down so the water level declines to the  
2 new index level. Would there be potential  
3 adverse impact to any wells from that event?

4 A. Yes, there could be.

5 Q. Do you think that based on the measurement of  
6 the depth in the current proposed index levels,  
7 and the proposed newer lower index levels, that  
8 those well impacts could be redressed by  
9 extending the wells down by the same number of  
10 feet that we are changing the index levels?

11 MR. STUCKY: I will object. This is  
12 outside of the scope of this expert's knowledge  
13 and expertise.

14 MR. McLEOD: I will withdraw the  
15 question.

16 BY MR. McLEOD:

17 Q. I think also, Mr. Pajor, there was some  
18 confusion in what the City would need to address  
19 the 1% exceedance drought because tallying  
20 numbers in a table you came to a \$50,000 some  
21 figure and at some other points in your  
22 testimony you talked about a \$60,000 acre foot  
23 figure. Is the difference there attributable to  
24 leakage from the credits?

25 A. I think it's attributable to my math in

1 summarizing those numbers, but there is a  
2 leakage loss.

3 Q. So if you thought you were going to have to pump  
4 56,000 acre feet of credits you might need to  
5 accumulate initially more than that because of  
6 leakage?

7 A. Oh, absolutely because every year when the  
8 accounting report is run we have additional  
9 losses and the fuller the aquifer is the greater  
10 losses are.

11 Q. So it would be logical that you would need some  
12 margin above what you would actually account for  
13 credits to account for that leakage?

14 A. Certainly.

15 MR. McLEOD: I don't have further  
16 questions for the witness.

17 THE HEARING OFFICER: Are there other  
18 questions for this witness before he is excused?  
19 First I will ask DWR.

20

21 RE CROSS EXAMINATION

22 BY MR. OLEEN:

23 Q. Mr. Pajor, I believe yesterday Ms. Wendling had  
24 a line of questions with you about whether the  
25 City might try to withdraw all of its

1 accumulated recharged credits, whatever those  
2 are, at one time, or in a non drought situation.  
3 Do you remember that highly summarized line of  
4 questioning?

5 A. Yes, I do.

6 Q. Is it true that you had attempted to explain  
7 that it would not be in the City's economic  
8 interest to use recharged credits in a non  
9 prolonged drought situation?

10 A. That was my intent.

11 Q. The current proposal does not offer any specific  
12 condition in that regard though, isn't that  
13 true?

14 A. I am not sure if that's true or not.

15 Q. Let me ask it, the question this way. Droughts  
16 are difficult in that one doesn't know whether  
17 one is in a drought until one might be already  
18 deep in to one to some extent. Is that fair?

19 A. Absolutely.

20 Q. So I understand that recognizing when one is in  
21 a drought can be difficult, but what I want to  
22 know is whether the City has contemplated some  
23 sort of expressed condition that would be  
24 imposed as part of this proposal, such that the  
25 City could only withdraw accumulated recharge

1 credits under some defined drought situation?

2 A. I think that's very reasonable. I mean that's  
3 our intention, that's our need, that's our  
4 economic interest. So having that as a  
5 restriction or a requirement would be entirely  
6 consistent with our objectives and our  
7 intentions.

8 Q. So to the extent that an appropriate condition  
9 could be drafted, that would limit the City's  
10 withdrawal of recharged credits only in some  
11 certain defined drought situation, the City is  
12 open to such an express condition to be imposed  
13 as part of this proposal?

14 A. Yes.

15 Q. To your knowledge has GMD2, or the Intervenors,  
16 or anyone else proposed such a condition, an  
17 express condition?

18 A. Not to my knowledge. And certainly to my  
19 frustration they have not.

20 Q. And to your knowledge the exact language of any  
21 such condition has not been discussed amongst  
22 the parties to this matter?

23 A. Not to my knowledge.

24 MR. OLEEN: No further questions.

25 THE HEARING OFFICER: Mr. Stucky, go

1 ahead.

2 MR. STUCKY: Thank you.

3

4 RECROSS EXAMINATION

5 BY MR. STUCKY:

6 Q. Just a moment ago you were asked about some  
7 existing conditions as far as the AMC proposal,  
8 do you recall that question a moment ago?

9 A. Yes.

10 Q. And just to be clear for the record, the concept  
11 that these aquifer maintenance credits have to  
12 only be withdrawn during the time of drought,  
13 that's not currently part of the proposal; is  
14 that correct?

15 A. Not to my recollection, that's correct.

16 Q. Okay. And, in fact, there was a draft order  
17 that was provided by the chief engineer early on  
18 in this case; is that correct?

19 A. Yes.

20 Q. And in that draft order of the chief engineer,  
21 was that condition part of that draft order?

22 A. I don't recall the terms and conditions in that  
23 draft.

24 Q. I ask that you flip in the black notebook to the  
25 proposal correspondence.

1 A. (Witness reviews documents).

2 Q. It is the pink tab.

3 A. Okay.

4 Q. And I tell you what, it's a lot of documents,  
5 that are hard to pull out, so I will just show  
6 you.

7 MR. STUCKY: May I approach the  
8 witness?

9 THE HEARING OFFICER: Yes.

10 (City Exhibit 14 was marked for  
11 identification by the Reporter.)

12 MR. OLEEN: Mr. Stucky, what are you  
13 marking?

14 MR. STUCKY: The draft order.

15 MR. OLEEN: From where did you get  
16 this?

17 MR. STUCKY: About the middle of the  
18 black notebook under proposal correspondence  
19 halfway through.

20 MR. OLEEN: If it's the enclosure with  
21 the chief engineer's letter of June 1st, which  
22 it appears to be, I will later be having the  
23 letter itself be an exhibit.

24 MR. STUCKY: We can mark this there.

25 MR. OLEEN: Maybe have the whole

1 enclosure.

2 MR. STUCKY: Let's mark it as your  
3 exhibit.

4 MR. BOESE: May I interject? With the  
5 issue of the City's notebook, because once again  
6 we have duplex pages that are not applicable.  
7 It would be much more helpful because we'll end  
8 up with pages from other exhibits because they  
9 are duplex.

10 THE HEARING OFFICER: Which document is  
11 this again?

12 MR. STUCKY: Findings and Order in the  
13 Matter of Permit Conditions Under Appropriation  
14 of Water, File Number 46,714. It's a draft  
15 order.

16 THE HEARING OFFICER: Is it the marked  
17 up draft?

18 MR. OLEEN: May we go off the record?

19 THE HEARING OFFICER: Yes. Off the  
20 record.

21 (A short off-the-record discussion  
22 was held at this time.)

23 THE HEARING OFFICER: We are now back  
24 on the record.

25 MR. STUCKY: At this time I would like

1 to withdraw City's Exhibit 14 and I would like  
2 to have permission to approach the witness  
3 again?

4 THE HEARING OFFICER: That's fine.

5 MR. STUCKY: Let's mark this.

6 (DWR Exhibit 1 was marked for  
7 identification by the Reporter.)

8 BY MR. STUCKY:

9 Q. Mr. Pajor, I have handed you what has been  
10 marked as DWR Exhibit 1. Do you recognize that  
11 document? If I were to tell you that's a cover  
12 letter from the chief engineer of the Division  
13 of Water Resources and also has some enclosed  
14 draft orders, would you agree that's what that  
15 document is?

16 A. Yes, absolutely.

17 Q. Have you seen that document before?

18 A. I believe I have.

19 Q. Does that seem to be an accurate depiction and  
20 copy of what the chief engineer has proposed in  
21 the past in that regard?

22 A. It certainly appears to be and to the best of my  
23 recollection, yes.

24 MR. STUCKY: I would like to go ahead  
25 and move to admit DWR Exhibit 1 in to evidence.

1 THE HEARING OFFICER: Any objections?

2 DWR Exhibit 1 will be admitted.

3 BY MR. STUCKY:

4 Q. Mr. Pajor, if you could flip to I believe it's  
5 the, we'll go past the cover letter, and if you  
6 could flip to the, it's about the fourth part of  
7 that and it's called, Draft, June 1, 2018,  
8 Proposed Replacement F&O for Phase II. Have you  
9 found a document that's titled that?

10 A. Yes.

11 Q. I would ask you to flip to the permit  
12 conditions, I am sorry, to the order.

13 A. Okay.

14 Q. Can you tell me where in the order itself, in  
15 this draft order, first of all, it states that  
16 aquifer maintenance credits can only be  
17 withdrawn during a time of drought.

18 A. (Witness reviews documents). You are asking me  
19 to find that?

20 Q. Yes. And to save you some time would you just  
21 agree with me that it is not currently part of  
22 the draft order?

23 A. I would agree with you. I don't find it as part  
24 of the draft order.

25 Q. Just a moment ago during the redirect by Mr.

1           McLeod, you also testified that you believed  
2           that with respect to this draft order it was a  
3           proposed part of the order itself that the  
4           40,000 acre feet of native water rights would  
5           have to be pumped first. Do you recall that  
6           question?

7           A. I do recall that question.

8                         MR. OLEEN: I object, I think that  
9           misstates the witness' testimony. Are you  
10          saying, Mr. Stucky, you are characterizing his  
11          testimony of this proposed finding and order?  
12          Or the proposal? Maybe you used the order when  
13          you meant the word proposal. Maybe I misheard.

14                        MR. STUCKY: I believe the question by  
15          Mr. McLeod was whether or not it was an order.  
16          I heard that question pretty exactly.

17                        MR. McLEOD: I believe that the witness  
18          was asked to address whether that was part of  
19          the proposed conditions, and I think they were  
20          proposed in a letter, which will later be  
21          introduced, and the witness was also asked  
22          whether that was an existing point of the  
23          existing ASR operations plan, to which he said  
24          that it is.

25                        MR. OLEEN: I withdraw my objection. I

1 just want to make sure we are being precise in  
2 what we are referring to.

3 BY MR. STUCKY:

4 Q. To be precise in what we are referring to, we  
5 are still referring to DWR Exhibit 1; is that  
6 correct?

7 A. Okay.

8 Q. And now that you have had a little chance to  
9 look at the order portion of that document,  
10 would you agree with me that there actually is  
11 no condition in that draft order portion that  
12 requires the City to first pump its 40,000 acre  
13 feet of native water rights before it can  
14 withdraw aquifer maintenance credits, would you  
15 agree with that statement?

16 A. Yes.

17 Q. And, in fact, if we were to pull up the official  
18 order of ASR Phase II, and we look at the order  
19 language of ASR Phase II, would you also agree  
20 that there is actually no requirement in the  
21 order conditions that the 40,000 acre feet of  
22 native water rights must be pumped first before  
23 recharged credits can be withdrawn?

24 A. I don't have knowledge of that.

25 Q. Well, maybe I misunderstood your testimony. A

1 moment ago I thought you testified in that  
2 regard. So if your testimony at this point is  
3 that you don't have knowledge of that aspect, I  
4 will move on.

5 Now, you also indicated just a few  
6 moments ago that when you spent time on the  
7 Equus Beds Groundwater Management Board, you  
8 have had the opportunity to review additional  
9 permits and appeals that have come before the  
10 Board. Do you recall that testimony again?

11 A. Yes.

12 Q. And, in fact, I believe that, well, let me ask  
13 you this. How many years have you served on the  
14 Equus Beds Groundwater Management Board?

15 A. Approximately nine years yesterday and  
16 approximately nine years plus one day today.

17 Q. All right. So through that board service, you  
18 have had the opportunity to consider, and I am  
19 going to ask, and we can ask it in a moment  
20 about whether or not you and abstained during  
21 those votes, that's not what I am asking; but  
22 during your board service, the ASR Phase II  
23 permits would have come up for review before the  
24 Board; is that correct?

25 A. I believe that's correct.

1 Q. And again, without looking at the record it's  
2 very possible you would have abstained, but at  
3 the very least on the official vote, but at the  
4 very least you would have heard the discussion  
5 with respect to the ASR Phase II permits, is  
6 that a true statement?

7 A. I cannot, from my recollection, determine  
8 whether or not that's a true statement. I mean,  
9 do you know when those permits would have been  
10 issued?

11 Q. If I were to tell you the last, last one was  
12 approved in 2010, would you agree that that  
13 would be --

14 A. That's within the margin of error of my estimate  
15 of when I started on the Board.

16 Q. Okay.

17 A. I cannot say definitively whether I was on the  
18 Board or not when that happened.

19 Q. Let me ask you this, to see if you can answer  
20 this question based on your board service or  
21 general knowledge of your ASR Phase II permits.  
22 Is it true that a number of, well, let me ask  
23 you this. Do you know what spacing requirements  
24 mean?

25 A. Regarding well spacing?

1 Q. Yes. Well spacing permit.

2 A. Yes.

3 Q. Can you, for a clear record, explain what  
4 spacing requirements are for a well permit.

5 A. Spacing requirements for wells are set to  
6 ensure, to protect against well to well  
7 interactions. And they are different for  
8 residential than they are for non residential  
9 wells. I am not sure, I can't share very many  
10 particulars off the top of my head. I can tell  
11 you that.

12 Q. With respect to ASR Phase II there were spacing  
13 requirements for those permits, is that a true  
14 statement?

15 A. I am sure.

16 Q. And if I were to tell you that the spacing  
17 requirements, for example, domestic wells was  
18 660 feet, would you agree with that statement?

19 A. I would.

20 Q. Now, if I were to also tell you that a number of  
21 those ASR Phase II permits did not meet those  
22 spacing requirements, would you agree with that  
23 statement?

24 A. Yes, I would.

25 Q. Would you also agree with the statement that

1 over a dozen of those ASR Phase II permits  
2 required what are called spacing waivers?

3 A. Yes, I would.

4 Q. Can you explain for the record what a spacing  
5 waiver is.

6 A. Spacing waiver is granted by a water rights, or  
7 water well owner, to allow encroachment by a  
8 subsequent applicant within the 660 foot  
9 distance of protection.

10 Q. So if you would have sought spacing waivers,  
11 with respect to these ASR Phase II permits, do  
12 you recall, have a recollection of whether or  
13 not they were granted?

14 A. My recollection is they were granted.

15 Q. Now, let me ask you this, if those ASR Phase II  
16 spacing waivers had certain conditions that they  
17 were based upon, would those same conditions now  
18 apply to the City's new proposal?

19 A. I can't speak to the legal mechanism of  
20 application, but I think it is reasonable that  
21 they would apply.

22 Q. Okay. Now, just a moment ago you were asked  
23 some questions about water that was left in a  
24 water bottle. Do you recall that discussion?

25 A. Yes.

1 Q. I want to start out by asking you to flip in the  
2 District's white notebook. And it would be  
3 Volume 1 of the District's notebooks.

4 MR. STUCKY: May I approach the  
5 witness?

6 THE HEARING OFFICER: Yes.

7 MR. STUCKY: I would like to go ahead  
8 and mark the District's Exhibit Number 8.

9 (GMD Exhibit 8 was marked for  
10 identification by the Reporter.)

11 BY MR. STUCKY:

12 Q. I have marked what's GMD 8. Do you recognize  
13 that document?

14 A. Yes.

15 Q. And just generally speaking, what is it?

16 A. It is a City of Wichita's response to the  
17 Groundwater Management District's second  
18 interrogatories.

19 Q. And to save time I flipped to a page where the  
20 signature portion of that document is; is that  
21 correct?

22 A. Yes.

23 Q. And would you agree that that is, in fact, your  
24 signature on this document?

25 A. Yes, it is.

1 MR. STUCKY: And again, I would like to  
2 formally admit this in to evidence.

3 MR. McLEOD: No objection.

4 THE HEARING OFFICER: GMD 8 will be  
5 admitted. And, Mr. Stucky, could you come look  
6 at my book and make sure I have the same  
7 document?

8 MR. STUCKY: Yes.

9 THE HEARING OFFICER: Thank you.  
10 Please go ahead.

11 BY MR. STUCKY:

12 Q. I would like to start by asking you to flip to  
13 question Number 12 in this particular document.

14 A. (Witness complies). Okay.

15 Q. Question Number 12, would you agree the  
16 question, and I will read it to you, it says:  
17 Please specify whether any of the following will  
18 occur when an AMC is accumulated as opposed to a  
19 physical recharge credit, prejudicially affect  
20 the public interest and impair existing water  
21 rights, and I won't read the full question. But  
22 do you see that particular question?

23 A. Yes.

24 Q. And there is an answer, and in that particular  
25 answer there is a discussion of how an AMC would

1 be withdrawn; is that correct?

2 A. Yes, it is.

3 Q. And I am going to back up just a moment. When  
4 an AMC is accumulated, I want to walk through  
5 the mechanics of that again, because there have  
6 been a number of questions. When an AMC is  
7 accumulated, and again we keep using this  
8 analogy of a gallon of water. If a gallon of  
9 water is taken from the Little Arkansas River  
10 during the time of overflow, it's treated, and  
11 it's diverted directly to the City, and that  
12 gallon of water would be used by the City; is  
13 that correct?

14 A. Yes, it is.

15 Q. And at a later time, and when that gallon of  
16 water is used by the City during that process,  
17 the City would acquire an aquifer maintenance  
18 credit for approximately another gallon of  
19 water; is that correct?

20 A. From the gallon of water we didn't remove from  
21 the aquifer, that gallon, that's what we get it  
22 for. We retagged a gallon of water in the  
23 aquifer as our AMC credit. It was water in the  
24 aquifer, it is now tagged, that gallon is tagged  
25 as AMC water, because it was not removed and

1 taken to town, because it wasn't needed because  
2 we took water through the plant and met that  
3 demand for that gallon in town. So we relabeled  
4 one gallon of water in the aquifer.

5 Q. And I understand your answer. And I am really  
6 not trying to trick you, Mr. Pajor. So follow  
7 me once again. We take a gallon of water to the  
8 city and for that gallon of water we take to the  
9 city, an aquifer maintenance credit would be  
10 accumulated. Let's say one aquifer maintenance  
11 credit.

12 A. Okay.

13 Q. At a later time, at a subsequent time then,  
14 would the city be able to withdraw a subsequent  
15 gallon of water from the aquifer?

16 A. At a subsequent point in time, the city would be  
17 able to withdraw the relabeled gallon of water  
18 in the aquifer, subject to the losses that occur  
19 from cell to cell and ultimately losses that  
20 occur out of the edge of the aquifer to the  
21 river. Subject to those losses, it's that  
22 relabeled gallon that we are able to recover.

23 Q. So subject to those losses, the answer to my  
24 question is yes; is that correct?

25 A. That is correct.

1 Q. Okay. And, in fact, if we were to read from  
2 interrogatory Number 12, what you wrote in  
3 interrogatory Number 12 is, and I am looking at  
4 the top of Page 8, very top of Page 8, it says:  
5 Subsequent withdrawal of the AMCs will result in  
6 a water level change equivalent to recovery of a  
7 recharge credit. End quote. Do you see where I  
8 am reading?

9 A. Yes.

10 Q. So, in other words, taking out this AMC at a  
11 subsequent time, and again I am using your  
12 language, at a subsequent time, would be similar  
13 to taking a gallon of water as if the City was  
14 diverting a later recharge credit, is that what  
15 you are saying?

16 A. Yes, I am.

17 Q. Now, let's go to the example of the water  
18 bottle. Let's say that I walked in to this  
19 room, and I am already tired from just having  
20 shoulder surgery and I am thirsty and I want to  
21 drink a water bottle, okay? And I have a water  
22 bottle and it is full. If I set it over here on  
23 the table, would you agree that I haven't drank  
24 that water bottle (indicating)?

25 A. Yes.

1 Q. Okay. Now, if I were to pull another water  
2 bottle off the table, and I were to drink this  
3 entire water bottle, would you agree then, let's  
4 assume, so I don't have to drink it in front of  
5 everybody in the room, let's just assume with me  
6 that I drank that water bottle and the bottle is  
7 now empty. Do you follow me?

8 A. Yes.

9 Q. Would you agree that that water was consumed and  
10 is now gone?

11 A. Yes.

12 Q. Okay. On the other hand, would you agree that  
13 this water bottle that I left in storage on the  
14 table is still full?

15 A. Yes.

16 Q. Now, moving back to the concept of an aquifer  
17 maintenance credit, if we analogize the water  
18 directed to the city, directly to the city for  
19 municipal use, would that at least be analogous,  
20 could you follow me for a moment, would that be  
21 analogous to me consuming a bottle of water?  
22 Would you agree that just like the city would  
23 consume that gallon of water, it would be  
24 similar to me drinking a bottle of water at the  
25 table. And I get that there is a lot of

1 technical differences, but just in a very  
2 fundamental level, would you agree that the  
3 water would be consumed by the city just like I  
4 would consume this bottle of water?

5 A. I am not sure I can agree with that because I am  
6 developing in my mind a parallel analogy that  
7 works differently than that. And maybe that's  
8 the problem we are having communicating on this.  
9 To me, you have a bottle of water there, and  
10 instead of consuming it, you are going to go out  
11 and use the water fountain, you will use the  
12 water fountain, so the water is still there. I  
13 am not --

14 Q. If I open this water right now I could drink it,  
15 correct?

16 A. Yes.

17 Q. It's available for me to drink; is that correct?

18 A. Yes.

19 Q. And, in fact, I just drank some of it, is that  
20 correct?

21 A. Yes.

22 Q. And so, in fact, just because it's left in  
23 storage on the table doesn't mean it can't be  
24 later consumed; is that correct?

25 A. Correct.

1 Q. So just back up with me for a moment. If this  
2 water, would you agree that similar to me  
3 drinking a bottle of water, and it's consumed,  
4 would you also agree that when a gallon of water  
5 is diverted to the city it's consumed by the  
6 city, would you agree with that premise?

7 A. I would agree.

8 Q. And would you also agree with the premise that  
9 just like I left this bottle of water  
10 unconsumed, with the aquifer maintenance credit  
11 proposal, a gallon of water would be left in the  
12 aquifer? Would you agree with that?

13 A. Yes.

14 Q. Would you also then agree that that gallon of  
15 water, just like I could drink this bottle of  
16 water at a later time, would you also agree that  
17 that gallon of water could be consumed by the  
18 city at a later time?

19 A. Yes.

20 Q. Okay. Now, let me ask you this about the water  
21 that is later consumed pursuant to an aquifer  
22 maintenance credit, okay? Where does that water  
23 come from? Does it come from the aquifer?

24 A. Yes.

25 Q. Now, I know you are going to tell me that's

1 water left in storage, but just so I am clear,  
2 would that be water that would be already  
3 appropriated by other permits?

4 MR. McLEOD: I am going to ask for a  
5 clarification. What's meant by other permits?  
6 Are you including the City's base right permits?

7 MR. STUCKY: Yes, I am including the  
8 City's based rights permits, I am including  
9 irrigators that may be in the room, I am  
10 including everybody's permit in the City's well  
11 field. That's the question.

12 BY MR. STUCKY:

13 Q. Would it already be water that is appropriated  
14 pursuant to other permits?

15 MR. McLEOD: And I am going to object  
16 now based on all the objections hitherto to by  
17 opposing counsel that the witness lacks the  
18 ability and expertise to speak to questions of  
19 that nature.

20 MR. STUCKY: Well, this isn't a  
21 technical question. This isn't asking for  
22 knowledge of hydrology, this isn't asking for  
23 asking for knowledge of hydro geology. The  
24 witness testified a moment ago that he has a  
25 basic understanding of approval of permits, and

1 as it's gone before the Board, and he has a  
2 basic understanding of the mechanics of a water  
3 right. This question is just about the  
4 mechanics of a water right. And the question is  
5 simply, where this water is coming from. It's  
6 not, it's not a technical question, it's not, I  
7 am not asking him to interpret the proposal or  
8 anything of that nature. It is just a very  
9 fundamental question asking if the witness knows  
10 whose water this is.

11 MR. McLEOD: The question is spatially  
12 asking for the witness to give a legal opinion  
13 on whether the water in the aquifer that's  
14 subject to an AMC is already appropriated by  
15 other permits. It is a legal opinion that's  
16 being called for, it's spatially a legal  
17 opinion.

18 THE HEARING OFFICER: I am not  
19 convinced that, forgive my voice, it seems to me  
20 that the question of whether or not water is  
21 appropriated under an appropriation right permit  
22 is a legal question. That's a fact question.  
23 So I will let the question go forward and the  
24 witness can answer, if he knows.

25 BY MR. STUCKY:

1 Q. Do you recall the question, Mr. Pajor?

2 A. I do recall the question. And my problem with  
3 the question is, water rights to withdraw  
4 physical water from an aquifer do not ever have  
5 to be tied out to the inventory of the water in  
6 the aquifer. Indeed, we live in a state in  
7 which the state, by its own decision, its own  
8 policy, has created rights to remove more water  
9 than the aquifer has available.

10 So when you ask the question, is that  
11 water that I characterized as relabeled, ASR  
12 water, already spoken for to other water right  
13 holders permits, I am not sure that I can  
14 connect those dots.

15 Q. Let me ask you the question this way. Yesterday  
16 I asked you some questions about whether or not  
17 the City's well field in the Equus Beds aquifer  
18 is over appropriated, do you recall the  
19 question?

20 A. Yes.

21 Q. And your answer was it's over appropriated; is  
22 that correct?

23 A. That is correct.

24 Q. So, in other words, would you agree that all the  
25 water that exists within the Equus Beds, the

1 City's well field, in the Equus Beds is already  
2 appropriated for someone's use?

3 A. Yes.

4 Q. So if you just follow me again, with this  
5 analogy, and we assume that all the water in the  
6 Equus Beds well field is already appropriated  
7 for someone's use, would you also agree with me  
8 that when this gallon of water is consumed  
9 pursuant to an aquifer maintenance credit,  
10 that's water that's already been dedicated to  
11 somebody's use?

12 A. The problem with that question is to the extent  
13 that I answered yes to your last question, it is  
14 impossible to use the aquifer as a storage  
15 vessel for physical recharge credits. Because  
16 when I put that physical recharge credit water  
17 in, you are now going to argue with that line of  
18 questioning that you just had that it's already  
19 spoken for by others. I can never go back and  
20 get it out because it's an over appropriated  
21 aquifer. All the water in there is spoken to.  
22 To this point, Chief Engineer Barfield has often  
23 used an analogy of different color of water.  
24 And that is my version of a labeled gallon of  
25 water that is now relabeled as ASR water.

1 That's a physical recharge credit, has to be  
2 able to achieved. We have an existing permit  
3 that says we can achieve a physical recharge  
4 credit. Your argument now suggests we can't  
5 produce physical recharged credits because we  
6 are in an over appropriated aquifer.

7 Q. And again, Mr. Pajor, I am really not trying to  
8 trick you in any means, I think just a moment  
9 ago --

10 MR. McLEOD: I will renew the  
11 objection. I think at this point it's become  
12 clear there is a legal argument in process  
13 between counsel and the witness.

14 MR. STUCKY: I think it's a simple  
15 question of whether or not the water is already  
16 dedicated to somebody else, and I can ask a few  
17 foundational questions to get to the point  
18 again.

19 THE HEARING OFFICER: I am not sure you  
20 are making progress. You and the witness don't  
21 seem to be seeing eye to eye. If you could ask  
22 a different way, or possibly move on.

23 MR. STUCKY: Okay. I will.

24 BY MR. STUCKY:

25 Q. Let me ask you this. With respect to a physical

1 recharge credit, when a gallon of water is put  
2 by the City in to the aquifer, would you agree  
3 that that is water dedicated to the City that  
4 the City can later take out and withdraw at a  
5 later time?

6 A. Not under the argument that you were just  
7 making.

8 Q. Well, a moment ago I think you said that all the  
9 water in the aquifer is already dedicated for  
10 use, and it is fully appropriated and dedicated  
11 for use by the users of the aquifer; is that  
12 correct?

13 A. No, sir. It's over appropriated.

14 Q. It's over appropriated?

15 A. It's worse than your assertion.

16 Q. So every gallon of water is dedicated in that  
17 aquifer to somebody; is that correct?

18 A. To a couple of somebodies.

19 Q. Yeah. To a lot of somebodies; is that correct?

20 A. Yes.

21 Q. So just so I am clear, if the City diverts that  
22 subsequent gallon of water out of the aquifer,  
23 pursuant to an aquifer maintenance credit, is  
24 that water that was already dedicated to  
25 somebody, one of those somebodies you just

1 referred to?

2 A. This is why the functional equivalent is so  
3 important. Your argument can't stop at AMCs, it  
4 has to role over physical recharge credits, too.  
5 To the extent it's valid and we put water in and  
6 try to get it back later or leave water in and  
7 try to get it later, if the reason we can't get  
8 it later is because the aquifer is over  
9 appropriated, it's over appropriated for  
10 everyone and all types of ASR.

11 MR. STUCKY: Madame Hearing Officer, I  
12 hate to do this but the last question was a  
13 simple yes-or-no question. It is just  
14 paraphrased the language used by the witness, it  
15 was a yes-or-no question, could you please  
16 direct the witness to answer the question in a  
17 yes or no format.

18 THE HEARING OFFICER: Would the witness  
19 please answer the question.

20 A. Yes, Madame Hearing Officer, if counsel would  
21 restate the question for my clarity, please.

22 Q. If a gallon of water is taken out of the aquifer  
23 at a subsequent time, and that is, in fact,  
24 water that's already dedicated to one of those  
25 many somebodies that used the water in the

1           aquifer, would that gallon of water then be  
2           taken from water that's already dedicated to  
3           those many somebodies?

4       A.    Yes.

5       Q.    Okay.  Now, if we back up just for a moment with  
6           respect to a physical recharge credit, would you  
7           agree that when there is a physical recharge  
8           credit accumulated, the City is actually putting  
9           a gallon of water in to the aquifer?

10      A.    Yes.

11      Q.    And would you also agree that when an aquifer  
12           maintenance credit is accumulated, the City is  
13           not actually diverting or pumping a gallon of  
14           water in to the aquifer?  Again, it's a  
15           yes-or-no question, Mr. Pajor.

16      A.    Yes.  Let's move on.

17      Q.    All right.  Now, I would ask that you flip to  
18           Exhibit 1, which is the City's proposal.

19      A.    (Witness reviews documents).

20      Q.    I ask that you flip to 41 of the City's  
21           proposal, City's Page 41 of the City's proposal.  
22           Are you on that page?

23      A.    Yes.

24      Q.    Now, at the very bottom of that page, it says:  
25           DWR, GMD2 staff and the City have each conveyed

1 interest in developing a simplified accounting  
2 method for AMCs. Do you see where I am reading?

3 A. Yes.

4 Q. And when Mr. McLeod was asking you questions you  
5 testified to the accounting methodology for the  
6 aquifer maintenance credits. Do you recall that  
7 question?

8 MR. McLEOD: That mischaracterizes the  
9 witness' testify. The witness was asked about,  
10 and testified about, orders by the chief  
11 engineer with respect to the accounting method  
12 and the accounting for physical recharge credits  
13 that have been approved in the past.

14 THE HEARING OFFICER: Could you  
15 restate?

16 MR. STUCKY: I will restate.

17 BY MR. STUCKY:

18 Q. Do you have any familiarity with the accounting  
19 methodology for aquifer maintenance credits?

20 A. I have very limited knowledge; but some, yes.

21 Q. And, in fact, yesterday did you testify, at  
22 least in a limited regard, to the accounting  
23 methodology for aquifer maintenance credits?

24 A. Yes, I did.

25 Q. Now on this particular page that I referred you

1 to in that paragraph, could you read for me into  
2 the record the second two sentences of that  
3 paragraph.

4 A. In addition, using the current accounting  
5 process for AMCs would be impractical as the  
6 physical ASR recharge accounting relies on a  
7 comparison of groundwater modeling results that  
8 utilize actual metered physical recharge values  
9 compared to actual water levels. There would be  
10 no observed water level to compare the AMC  
11 results against, since the location of the AMC  
12 recharge would be theoretical.

13 Q. So just a couple of things, so I am clear about  
14 this. The reason why there would be no reason  
15 for metering with respect to an aquifer  
16 maintenance credit, as it says in that first  
17 sentence, is because no water would be pumped or  
18 diverted in to the aquifer; is that correct?

19 A. That is correct.

20 Q. And also in the second sentence, the reason why  
21 it says that AMC recharge would be theoretical  
22 is because no actual physical recharge would  
23 occur; is that correct?

24 A. Correct. Because it's a relabeling of that  
25 gallon.

1 Q. Okay. I would like you to, well, let me ask it  
2 this way. Is it true that without an attempt to  
3 accumulate a physical recharge credit, is it  
4 true that the City has already diverted water  
5 directly from the Little Arkansas River to the  
6 City for its use?

7 A. Yes, that's correct.

8 Q. And, in fact, that was done in a time when the  
9 Equus Beds well field, or the City's well field  
10 the Equus Beds aquifer, was already full; is  
11 that correct?

12 A. Yes, that's the only reason we would have taken  
13 that water to town.

14 Q. And is the reason that you were able to take  
15 that water to town because the City's existing  
16 ASR II permit has two uses in the permit, is  
17 that a true statement?

18 A. That's a true statement.

19 Q. And if I were to tell you that the two uses of  
20 the existing ASR II permit are for municipal  
21 use, number one; and for recharge credits,  
22 number II. Would you agree with that statement?

23 A. Yes, I would.

24 Q. And so when that water is diverted directly to  
25 town, it's being used for municipal use, that's

1 the beneficial use; is that correct?

2 A. Yes.

3 Q. When that water was pumped directly to town, and  
4 no recharge credit was accumulated during that  
5 gallon being pumped, would you agree that's the  
6 only beneficial use being made of that water?

7 A. No, I would not. There is a beneficial use of a  
8 gallon of water that was not removed from the  
9 aquifer to meet that same demand of our  
10 customers.

11 Q. Where in your ASR Phase II order does it have  
12 that third beneficial use that you are referring  
13 to?

14 A. It doesn't.

15 Q. So that's --

16 A. To my knowledge.

17 Q. So I am asking just about those two beneficial  
18 uses that are in the ASR Permit II, and again,  
19 there is no attempt to deceive you with those  
20 questions. Well, first of all, let me ask you  
21 this. Do you know how many gallons of water  
22 have been diverted to the City where no physical  
23 recharge credit was accumulated?

24 A. No, I don't.

25 Q. I would ask that you flip in the black notebook

1 to the City's correspondence. It's the pink tab  
2 called proposal correspondence.

3 A. Okay.

4 Q. And if you walk with me for just a moment, I  
5 flip pages a little slower than others right  
6 now.

7 A. I should be able to keep up then.

8 Q. Yes. It's obviously toward the end of this  
9 particular document.

10 MR. STUCKY: May I approach the  
11 witness?

12 THE HEARING OFFICER: Yes.

13 BY MR. STUCKY:

14 Q. There you go. Just to refresh the witness'  
15 memory in this regard, I have asked that you  
16 flip in the City's Exhibit notebook to a  
17 document that was written by Mr. Barfield to the  
18 City on May 22, 2018. Is that a true statement?

19 A. Yes, it is.

20 Q. I am sorry, I mischaracterized, I apologize, it  
21 was a letter written by the City to Mr.  
22 Barfield. Is that a true statement?

23 A. That's even more true, yes.

24 Q. Okay. I mischaracterized, my mistake. So, in  
25 fact, if we were to flip to the last page of

1           that document, there is a signature page on page  
2           127 of this document. And that document was  
3           signed by Alan King; is that right?

4   A.   That is correct.

5   Q.   So would you agree that this would characterize  
6           an official opinion or statement that was made  
7           by the City?

8   A.   Yes, I would.

9   Q.   Now, I would ask that you flip to page 125 of  
10          that document. And I want you to read to me  
11          from the very bottom of page 125 of that  
12          document for the record.

13   A.   Number 10, for 2014 and 2015 a total of 1,132.19  
14          acre feet was diverted to town and could have  
15          been diverted to AMCs. Any calculation related  
16          to years prior than 2014 would be highly  
17          speculative in nature.

18   Q.   So a moment ago I asked you, at least, let's  
19          focus on the years 2014 and 2015. Would you now  
20          have an opinion, at least for those years, as to  
21          how much water was sent directly to the City for  
22          municipal use where no recharge credit was  
23          accumulated?

24   A.   Yes.

25   Q.   What would be your answer?

1 A. 1,132.19 acre feet.

2 Q. Now, if we were to focus on the ASR II, order  
3 and permit, and those accompanying documents,  
4 would you agree that that water was used as a  
5 municipal beneficial use?

6 A. Yes, I would.

7 Q. And would you also agree with me that that water  
8 was not used pursuant to the other beneficial  
9 use. Namely, the recharge credit beneficial  
10 use?

11 A. With that argument you can't have AMCs. And I  
12 know that's where you are trying to get me to.

13 Q. Well, I am just asking you to answer the  
14 question.

15 A. Sure. I will answer it yes.

16 Q. All right. Now, if we were to, well, you were  
17 asked a few moments ago some questions by Mr. --  
18 well, I want to back up also just to clarify the  
19 record.

20 Yesterday you were asked how many  
21 permits the City had, and I believe your answer  
22 was five. Is that correct? I am sorry, how  
23 many water rights the City has. I am sorry.  
24 Mr. Oleen, I misspoke. Mr. Oleen asked you  
25 yesterday how many water rights account for the

1 40,000 acre feet owned by the City? Do you  
2 recall that questioning yesterday?

3 A. I do.

4 Q. And I believe it was stated there were five?

5 A. I believe that's what was said.

6 Q. Could you name those five water rights?

7 A. No, sir, I could not.

8 Q. If I were to tell you, to clarify the record  
9 today, that there were actually three water  
10 rights, would you have reason to disagree with  
11 me?

12 A. I would not.

13 Q. Now, it is my understanding that with respect to  
14 aquifer maintenance credits and the City's  
15 proposal, well, let's just focus on lowering the  
16 minimum index level of the proposal. Would  
17 lowering the minimum index level apply to the  
18 existing ASR Phase II permits?

19 A. Yes.

20 Q. What about, would it apply to any future Phase  
21 II applications?

22 A. I don't know. We haven't made such  
23 applications.

24 Q. Well, from your knowledge, having sat on the  
25 Board, and your knowledge of approvals of

1           permits on the Board, do you have an opinion in  
2           that regard, as you are sitting here today?

3       A.    No.

4       Q.    And so you don't have an opinion, as you are  
5           sitting here today, whether or not the lowering  
6           of the minimum index level, if that change would  
7           apply to future permits of the City, or future  
8           applications of the City, you are not prepared  
9           to answer that question; is that correct?

10      A.    That's right.

11      Q.    Okay.  If I were to tell you that the draft  
12           order that we admitted as DWR Exhibit 1 just a  
13           moment ago, if I were to tell you that that  
14           order refers to all existing permits of the  
15           City, and all future permits of the City, would  
16           you have reason to disagree with me?

17      A.    I would not.

18      Q.    Are you familiar with the concept of ASR Phase  
19           III?

20      A.    Yes.

21      Q.    Can you tell me what ASR Phase III is.

22      A.    It is one of several different alternatives that  
23           we have considered for future development and  
24           expansion of the capacities and capabilities of  
25           ASR.

1 Q. Has there been any application made for grant  
2 funding for ASR Phase III?

3 A. Yes.

4 Q. What was the result of that application?

5 A. We were unsuccessful in receiving the grant  
6 funds, is my recollection.

7 Q. Pursuant to ASR Phase III, would one of the  
8 goals of ASR Phase III be to put additional bank  
9 storage wells in to place along the Little  
10 Arkansas River?

11 A. Potentially.

12 Q. And let me just ask you this, if additional bank  
13 storage wells were put in to place along the  
14 Little Arkansas River, would that increase the  
15 City's capacity to accumulate aquifer  
16 maintenance credits?

17 A. Am I to assume we have such things?

18 Q. If they were to be put in place would that  
19 increase the City's capacity to accumulate  
20 aquifer maintenance credits?

21 A. Not in and of itself, it would be subject to the  
22 availability of not being able to recharge the  
23 aquifer, otherwise it would be physical recharge  
24 credits we would be producing.

25 Q. If the aquifer was full and you were unable to

1 recharge the aquifer, and the City were to put  
2 in to place additional bank storage wells, would  
3 that increase the City's capacity to accumulate  
4 AMCs?

5 A. Yes, it would.

6 Q. Yesterday, and I just, I am not sure I am clear  
7 on this question. Yesterday there was a  
8 question about the 120,000 acre feet of  
9 recharged credits and there was some questions  
10 with regard to that. And it was indicated that  
11 50,000 acre feet of credits would be needed  
12 during a 1% drought; is that right?

13 A. I believe that was my statement and I would  
14 suggest that that number was an approximate  
15 number. The number may actually be 60 or 60  
16 plus thousand.

17 Q. Okay. And I just, I want to characterize the  
18 testimony yesterday of Mr. Winchester, which you  
19 heard, his testimony was that a 1% drought  
20 occurs once every 100 years; is that right?

21 A. No.

22 Q. Well, was it his testimony that although you  
23 can't predict when a 1% drought will occur, when  
24 we are calculating a 1% drought we are looking  
25 at an event that we are predicting will occur

1           once every 100 years, is that a 1% drought?

2       A.    No.

3       Q.    What is your definition of a 1% drought?

4       A.    There is a 1% probability of that drought  
5           occurring every year.

6       Q.    So if we were to multiply 1 x 100 to come up  
7           with 100 years, do you follow my math so far, 1  
8           x 100 is 100; is that correct?

9       A.    Yes.

10      Q.    And if we were to then assume that in any given  
11           year, well, if, then statistically speaking a 1%  
12           drought could occur, would most likely occur in  
13           one time in a 100 years; is that right?

14      A.    No. That is not right. You cannot add up the  
15           1% probabilities for 100 times and be assured of  
16           a 1% drought in that 100 year period. It's  
17           statistics.

18      Q.    I understand, I am not saying we are assured of  
19           it, I understand statistics, and I am not saying  
20           we are assured of it. But if we were to play  
21           the averages, if we were to assume and play the  
22           averages, statistically would a 1% drought  
23           generally happen just once in a 100 years?

24                   MR. McLEOD: I am sorry, in the  
25           questioning if we were to assume what?

1 MR. STUCKY: If we were to just assume  
2 these percentages, assume that these  
3 calculations as far as how we are characterizing  
4 a 1% drought.

5 BY MR. STUCKY:

6 Q. Let me ask you this. If you were to be an odds  
7 maker, if you were to predict when, if the City  
8 is trying to predict when a 1% drought would  
9 occur, how many times, if you were an odds maker  
10 and you were playing the bets at Vegas, how many  
11 times would you predict that a 1% drought would  
12 occur within 100 year period?

13 A. It would be irresponsible for me to answer that  
14 question as a utility executive. That isn't the  
15 way we approach it.

16 Q. All right. So as you are sitting here today,  
17 you don't have an answer to that question; is  
18 that correct?

19 A. I am telling you the question is inappropriate.

20 Q. Okay. Is the question unclear? Or how could I  
21 better clarify or rephrase?

22 A. You could describe the 1% probability drought as  
23 having a 1% probability of occurring each and  
24 every year. I feel like I am watching the 6:00  
25 o'clock news and somebody just said we had the

1 100 year flood last year, this can't be 100 year  
2 flood. It certainly can. That's my problem.

3 Q. No, I think we are saying two different things.

4 MR. McLEOD: At this point I am going  
5 to say asked and answered multiple times, and  
6 also I will point out Mr. Pajor has not been  
7 qualified to speak as a statistician, and I  
8 think counsel is roaming in to an area where he  
9 has not been qualified as an expert.

10 MR. STUCKY: I can move on.

11 THE HEARING OFFICER: Let's move on.

12 MR. STUCKY: Okay. Fair enough.

13 BY MR. STUCKY:

14 Q. I am going to ask that you flip in the District  
15 Exhibit notebook in Number 14 in the District  
16 exhibits. I think I asked you to flip to the  
17 wrong document.

18 A. I am at DWR's responses to GMD2's second set of  
19 admissions.

20 Q. I am sorry, I would like for you to flip to  
21 Exhibit Number 6.

22 A. Okay.

23 Q. If you were to flip to the last page of that  
24 document, would you agree that that is, in fact,  
25 or one of the last pages of that document, would

1           you agree that that is, in fact, your signature  
2           on one of the last pages of that document?

3       A.    I would agree that on Page 17 that's my  
4           signature.

5                       MR. STUCKY:   At this time I would like  
6           to mark GMD's Exhibit 6.

7                       (GMD Exhibit 6 was marked for  
8           identification by the Reporter.)

9       BY MR. STUCKY:

10      Q.   Just a moment ago I think you examined the GMD  
11           Exhibit 6 and acknowledged the fact that those  
12           are interrogatories that were sent to the City  
13           by the District; is that correct?

14      A.   These are responses to those, correct.

15                       MR. STUCKY:   I would like to move to  
16           admit GMD 6 in to evidence.

17                       THE HEARING OFFICER:   Any objection?

18                       MR. McLEOD:   No objection.

19                       THE HEARING OFFICER:   GMD 6 will be  
20           admitted.

21      BY MR. STUCKY:

22      Q.   Just a moment ago you were asked some questions  
23           about multiyear flex accounts and you, you were  
24           asked about an Exhibit 13 of the City; is that  
25           correct?

1 A. Yes.

2 Q. And in response to, the response that was made  
3 by the City documented the analysis that was  
4 performed with respect to multiyear flex  
5 accounts; is that right?

6 A. Yes.

7 Q. And in the response that you read for the  
8 record, would you agree that what was stated was  
9 that someone from the Division of Water  
10 Resources advised the City that it was not the  
11 best idea to utilize multiyear flex accounts?

12 MR. McLEOD: Just on characterization,  
13 was the question meant to seek that was part of  
14 what was stated?

15 MR. STUCKY: Yes.

16 BY MR. STUCKY:

17 Q. If we could go back to interrogatory number 19  
18 of the City's Exhibit 13.

19 A. (Witness reviews documents). Can you tell me  
20 where to find that?

21 MS. WENDLING: In the lime binder.

22 MR. OLEEN: Did you perhaps mean  
23 Exhibit 15, Mr. Stucky?

24 MR. STUCKY: 13. Yes. I will make  
25 this easy for you, Mr. Pajor.

1 BY MR. STUCKY:

2 Q. If you flip to Volume I to Exhibit 18, I will  
3 make it easy for you.

4 MR. STUCKY: And just for clarity  
5 purposes, I would like to mark GMD Exhibit 18.  
6 I know it's a duplicate but so we could have a  
7 clean set.

8 (GMD Exhibit 18 was marked for  
9 identification by the Reporter.)

10 MR. STUCKY: I would like to, and it's  
11 a duplicate copy, but I would like to offer GMD  
12 18 in to evidence.

13 MR. McLEOD: No objection.

14 MR. OLEEN: No objection, but a  
15 request. Mr. Stucky, please help me with my  
16 disorganization. Which one?

17 MR. STUCKY: Do you have the exhibit  
18 notebooks that were furnished to you by the  
19 District?

20 MR. OLEEN: Yes, I do.

21 MR. STUCKY: Volume I, Number 18.

22 MR. OLEEN: And you asked that it be  
23 marked 18?

24 MR. STUCKY: Yes, I will mark them all  
25 eventually.

1 THE HEARING OFFICER: So as I  
2 understand it, Mr. Stucky, GMD 18 is the same as  
3 City 13?

4 MR. STUCKY: That's correct. I am  
5 doing it for convenience.

6 THE HEARING OFFICER: GMD 18 will be  
7 admitted.

8 BY MR. STUCKY:

9 Q. I ask that you flip to interrogatory number 19  
10 in that document. And again, you can flip to  
11 either GMD Exhibit 18 or the City's Exhibit 13.  
12 Either one.

13 A. Okay. I am there.

14 Q. Now, if you look with me and read with me at the  
15 bottom of that page, it says: Further, DWR  
16 staff has not proposed multiyear flex accounts  
17 as an alternative, and have advised that they  
18 would not consider such accounts a viable  
19 alternative due to health and safety concerns.  
20 End quote. Would you agree I have accurately  
21 read that sentence?

22 A. Yes, sir, you have.

23 Q. Would you agree that it at least implies someone  
24 from the Division of Water Resources advised the  
25 City that multiyear flex accounts were not the

1 best solution? Would you agree with that  
2 statement?

3 A. Yes, sir, I would.

4 Q. Were you part of these discussions?

5 A. I do not recall having had discussions on this  
6 subject with any DWR staff. I do recall having  
7 discussions on the subject with city staff and  
8 our consultants regarding discussions with DWR  
9 regarding this.

10 Q. Okay. Do you have any knowledge then, as you  
11 are sitting here today, who on the DWR staff  
12 advised you that multiyear flex accounts were  
13 not a viable alternative?

14 A. I do not.

15 Q. Do you have any knowledge of who with the City  
16 may be able to answer that question?

17 A. Not from my knowledge.

18 Q. Now, just a little bit ago with respect to  
19 multiyear flex accounts, on Number 1 it was  
20 stated, multiyear flex accounts require term  
21 permits to be issued to replace the base water  
22 rights during suspension; therefore, all  
23 pumping, including the quantity under 40,000  
24 acre feet, would be junior to most surrounding  
25 rights. Do you see where in that response I was

1 reading?

2 A. Yes, I do.

3 Q. And, in fact, there was a discussion that the  
4 City was concerned that if a multiyear flex  
5 account was used, their 40,000 acre feet would  
6 suddenly become junior and would no longer have  
7 a senior priority. Is that what their concern  
8 is?

9 A. Yes, it is.

10 Q. I would ask that you --

11 MR. STUCKY: May I approach the  
12 witness?

13 THE HEARING OFFICER: Yes.

14 BY MR. STUCKY:

15 Q. I would ask that you flip to Exhibit Number 22  
16 in Volume II. Would you agree that those are  
17 the rules and regulations of the Kansas Water  
18 Appropriation Act?

19 A. Yes. Is this it in its entirety?

20 Q. Yes, it is.

21 A. No wonder your notebooks are so thick.

22 MR. STUCKY: I know that we have taken  
23 judicial notice of these rules and regulations,  
24 but I would like to go ahead and mark this as  
25 GMD's Exhibit 22.

1 (GMD Exhibit 22 was marked for  
2 identification by the Reporter.)

3 MR. STUCKY: I can't imagine there will  
4 be a dispute in this regard, since you've  
5 already taken judicial notice, but I would like  
6 to admit this in to evidence.

7 THE HEARING OFFICER: Any objection?

8 MR. OLEEN: Not an objection, Madame  
9 Officer, I presume that these are all the most  
10 updated DWR regs. I agree it could, well, to  
11 the extent qualified people are going to talk  
12 about laws, it could be helpful for us to all  
13 have a set to look at. I don't know if this is  
14 the full set, I don't know if this is an updated  
15 set. Just so we are not bound to this Exhibit  
16 22 being the actual laws and that to the extent  
17 you, Madame Officer, will be referring to laws  
18 you won't just be referring to what's here,  
19 because I don't know what is actually here.

20 MR. STUCKY: If I could respond to that  
21 very briefly. Yesterday a lot of exhibits were  
22 admitted as official government documents. This  
23 was printed directly off the Water Resources'  
24 website just shortly before this hearing, for  
25 what it's worth.

1 THE HEARING OFFICER: To the extent  
2 that anything in this exhibit is not consistent  
3 with current statute and regulation, then I will  
4 rely on the current statute and regulation.

5 MR. OLEEN: Thank you. That dissuades  
6 my concern.

7 BY MR. STUCKY:

8 Q. I want to clarify the record because you  
9 testified to an aspect in that interrogatory.  
10 If we were to flip to K.A.R. 5-16-7 on Page 161  
11 of that document.

12 THE HEARING OFFICER: I am sorry, could  
13 you repeat that page number?

14 MR. STUCKY: Page 161.

15 BY MR. STUCKY:

16 Q. If I were to tell you that pursuant to a  
17 multiyear flex account, native senior water  
18 rights are protected, would you have reason to  
19 disagree with me, if I were to characterize that  
20 regulation in that fashion? Would you have  
21 reason to disagree with me, if I were to  
22 characterize it as saying that the quantity  
23 authorized with respect to a senior native water  
24 right is protected, would you disagree with that  
25 characterization?

1 A. No.

2 MR. McLEOD: Madame Hearing Officer, I  
3 think we are again, we are getting in to an area  
4 where counsel is asking the witness to make  
5 interpretations of laws and regs, and maybe such  
6 an argument would be properly relegated to the  
7 post hearing briefs where legal arguments are  
8 normally made, rather than in the evidence.

9 MR. STUCKY: If I could respond, just a  
10 moment ago he testified to the exact opposite  
11 and what this regulation says, is that any  
12 existing water right that is put in to a  
13 multiyear flex account, that quantity is  
14 protected, and that water right is protected.  
15 And in this interrogatory was read into the  
16 record, which states something different. So  
17 because it was read into the record the witness  
18 testified to something different. So I think it  
19 is a fair question in that regard.

20 THE HEARING OFFICER: I think since the  
21 witness opened the door to that, that allows  
22 questioning on that. If that's a criteria on  
23 which a decision was made, I think exploring  
24 that criteria is fair.

25 MR. McLEOD: I would make the further

1 point that the witness read it into the record  
2 because it is in the interrogatory response.  
3 And essentially what counsel is doing is legally  
4 arguing with the interrogatory response by going  
5 through this set of steps. And again, that  
6 would be more appropriately done in post hearing  
7 briefs than in the evidence.

8 THE HEARING OFFICER: Perhaps so, but  
9 the interrogatory response, as I understand it,  
10 was created by the witness.

11 MR. McLEOD: Mr. Pajor, I think signed  
12 the interrogatories. I don't think there has  
13 been any voir dire as to whether the analysis in  
14 that response was actually created by Mr. Pajor.

15 MR. STUCKY: Well, let me ask this.

16 BY MR. STUCKY:

17 Q. Mr. Pajor, before you signed those interrogatory  
18 responses did you review them?

19 A. Yes.

20 Q. And so when you signed that interrogatory and  
21 affirmed that everything in those  
22 interrogatories was true and correct, when you  
23 placed your signature on that, one could assume  
24 you would have read it, correct?

25 A. Yes.

1 Q. So to back up, if we were to ask you about your  
2 answer to interrogatory number 19, would you at  
3 least agree with me now, that Number 1, bulleted  
4 point Number 1, in that response, is incorrect?

5 A. That appears to be the case.

6 Q. Okay. I am just going to ask one question about  
7 the proposal. Is there any knowledge that you  
8 have about whether or not, as far as a permit  
9 condition, that some sort of requirement for  
10 rotational pumping would occur? In other words,  
11 the City would withdraw its aquifer maintenance  
12 credits in a rotational fashion.

13 In other words, at one point they  
14 recover some of the credits from one part of the  
15 well field, and at another time recover some of  
16 credits from a different part of the well field,  
17 and the reason for doing that is to better  
18 protect the aquifer. Do you recall that being a  
19 proposed permit condition?

20 A. I call it in discussion, I don't know whether it  
21 is in the proposed permit condition or not. It  
22 seems reasonable that it would be.

23 Q. Do you think it would be a reasonable permit  
24 that if the City were to use an aquifer  
25 maintenance credit, that the amount of water

1           that could be taken to town at a later time  
2           would be reduced? Do you think that would be a  
3           reasonable requirement?

4   A.   Reduced to what? For what? Why? How?

5   Q.   Well, we'll strike that question actually.  
6       We'll withdraw it.

7                    You were asked some questions about  
8           seepage and accounting by Mr. McLeod a few  
9           moments ago. And the City has provided some  
10          percentages as far as what that seepage could  
11          look like. Are you prepared or qualified to  
12          testify on that subject?

13   A.   Not in my opinion.

14   Q.   Okay. I will move on.

15                    You were asked a question a little bit  
16           ago about 19,000 acre feet that could be pumped  
17           under the existing permits pursuant to ASR Phase  
18           II. Do you recall that question?

19   A.   Yes, I do.

20   Q.   Just to clarify the record, the 19,000 acre  
21          feet, that would be an annual requirement; is  
22          that correct? An annual quantity; is that  
23          correct?

24   A.   Yes.

25   Q.   You were also asked some questions by Mr. McLeod

1 about whether or not lowering the index level  
2 would be a benefit to the aquifer. And I think  
3 your answer was yes in that regard. My question  
4 is, would you agree that when an aquifer  
5 maintenance credit, when those credits are used,  
6 would the water in the aquifer potentially be  
7 drawn down to a lower level than it could be  
8 drawn down today by the City, pursuant to the  
9 physical recharge credits?

10 A. Yes. But only about once every 100 years.

11 Q. Okay. Aha, that gets --

12 A. Aha.

13 Q. That gets me back to my prior question.

14 A. Aha.

15 Q. That gets me back to my prior question. So in  
16 your estimation, the aquifer maintenance credits  
17 would be used and withdrawn essentially once  
18 every 100 years; is that correct?

19 A. You betcha, you got me. Let's move on.

20 Q. So with respect to that, is it true that if  
21 50,000 acre feet of aquifer maintenance credits  
22 would be needed once every 100 years to utilize  
23 the entire 120,000 acre feet of aquifer  
24 maintenance credits, which is the cap, from a  
25 mathematical perspective would it take

1 approximately 240 years to use that 120,000 acre  
2 feet?

3 A. Yes. And isn't that a benefit to the aquifer?

4 MR. STUCKY: No further questions.

5

6 RE CROSS EXAMINATION

7 BY MS. WENDLING:

8 Q. Earlier this morning I believe you testified  
9 that it would take a long time for the levels to  
10 be drawn down enough by the City to earn  
11 physical recharge credits without this proposal.  
12 That's when you were talking about the aquifer  
13 depleting aside from the City's pumping?

14 A. Yes.

15 Q. Have you been able to quantify what a long time  
16 is?

17 A. That has, estimates have been made, I do not  
18 know the answer to the question what is that  
19 amount, I don't have that with me.

20 Q. So do you, to your knowledge has the City  
21 modeled how long it would take the aquifer to  
22 draw down to a level where physical recharge  
23 credits could be accumulated?

24 A. I don't know that we have modeled it, I know we  
25 have estimated it.

1 Q. Do you know who would have that estimated  
2 amount?

3 A. I am not sure who would have that information.

4 Q. Earlier Mr. McLeod had tried to clarify some of  
5 my questions between lowering the minimum index  
6 level, and lowering the aquifer level, actual  
7 water in the aquifer. And yesterday you had  
8 testified that a potential detriment to lowered  
9 aquifer water levels is the chloride plume  
10 coming from Burrton. Do you still stand by that  
11 testimony from yesterday?

12 A. Yes.

13 Q. And on our favorite subject this morning of  
14 AMCs, you have described that as earning a  
15 credit for water left in the aquifer; is that  
16 correct?

17 A. Yes, I have.

18 Q. Is it your belief that anyone who leaves water  
19 in the aquifer should similarly obtain such a  
20 credit?

21 A. No, it is not.

22 Q. And why should the City earn a credit for water  
23 left, if not others?

24 A. If another water rights user can meet the water  
25 demand that they have from a source other than

1 the aquifer and leave a credit of water in the  
2 aquifer, then the argument is parallel. If they  
3 cannot, it is not.

4 Q. If the City is able to have this proposal  
5 approved for AMCs and a lower index level, is  
6 further development of the ASR project  
7 necessary?

8 A. Future developments of the ASR will be made,  
9 based on future decisions. I cannot, I cannot  
10 predict whether or not there would be additional  
11 development.

12 Q. Okay. You had previously talked about Mr.  
13 Barfield's color characterization for the ASR  
14 project, and I believe it was something like  
15 water in the aquifer is red and physical  
16 recharge credits are blue. Is that your  
17 recollection as well?

18 A. I don't know that I used the colors, because I  
19 have never liked those two particular colors to  
20 be picked; but, yes, I did talk about different  
21 colors. I characterized it this morning as  
22 relabeling.

23 Q. If we were to build on Mr. Barfield's example,  
24 using any colors you like, what colors would you  
25 use for the aquifer, physical recharge and AMC

1 credit?

2 A. I am fine with any colors. Let's stay with blue  
3 and red, that is fine. We'll turn it from blue  
4 water to red water.

5 Q. So you are changing the color of the water?

6 A. Right. In aquifer maintenance credits, that's  
7 what we are doing.

8 Q. Okay. And that's consistent with your theory of  
9 relabeling?

10 A. As opposed to putting in a red unit of water, we  
11 are changing a color.

12 Q. All right. And I believe you said earlier that  
13 it would not be economical for the City to use  
14 the recharge credits, other than during a  
15 drought; is that correct?

16 A. Correct.

17 Q. And the City intends to use the credits in order  
18 to meet customer demands or customer needs  
19 during a drought; is that correct?

20 A. Correct.

21 Q. When you used the term customer need or customer  
22 demand, does that include customers outside of  
23 the City of Wichita?

24 A. Yes.

25 Q. Is the City required to take on customers

1 outside of the City of Wichita?

2 A. To my knowledge the City is not required to take  
3 on customers at all.

4 Q. So it is the City's decision to take on these  
5 customers outside of the city?

6 A. It's the City's -- the City has to agree to it.

7 Q. Okay. Does the City generally have contracts  
8 with their water customers?

9 A. We generally have contracts with our wholesale  
10 customers, not with our retail customers.

11 Q. For your wholesale customers, do you guarantee  
12 them water availability during a 1% drought?

13 A. First of all, there is a dozen different  
14 contracts, they are not all the same. And I  
15 could not speak from my knowledge of those  
16 contracts at the moment what, if any, language  
17 there is relative to guarantee of water supply.

18 Q. Okay. When, well, are you involved in  
19 considering whether to take on new wholesale  
20 customers?

21 A. Yes.

22 Q. And do you consider the City's ability to meet  
23 those water demands prior to taking on such new  
24 customers?

25 A. Yes.

1 Q. And have you modeled, prior to taking on  
2 customers, the ability to provide their water  
3 needs in the event of a 1% drought?

4 A. Prior to taking them on?

5 Q. Correct.

6 A. Once we take them on, they are in our base, and  
7 every time we model we model them in our base.

8 Q. When was the first time you modeled the ability  
9 of the City to meet demand during a 1% drought?

10 A. I can't say specifically, but in the last couple  
11 of years. I can tell you we haven't taken on  
12 any wholesale customers since we did that  
13 modeling. So we haven't gotten to that point  
14 yet. But we would put that new customer in to  
15 our base to evaluate it.

16 MS. WENDLING: No further questions.

17 THE HEARING OFFICER: Mr. McLeod,  
18 anything else or can we excuse or witness?

19 MR. MCLEOD: I have just a very, very,  
20 few redirect clean ups.

21

22 FURTHER REDIRECT EXAMINATION

23 BY MR. MCLEOD:

24 Q. Mr. Pajor, all the back and forth on the  
25 aquifer, the City's base water rights 40,000

1 acre feet per year, is there a temporal element  
2 to those water rights?

3 A. Yes.

4 Q. And if the City, if the City goes from year one  
5 to year two and only draws ten acre feet, under  
6 its 40,000 acre feet rights, what happens to the  
7 rest of it when the year closes out?

8 A. The authorization to remove that water is lost.

9 Q. For that year?

10 A. Yes.

11 Q. So the City has foregone the percentage of its  
12 right not drawn for the year for which it did  
13 not draw it?

14 A. Yes.

15 Q. And that water has remained in the aquifer as a  
16 consequence?

17 A. Yes.

18 Q. Is that why, is that the explanation of how we  
19 can have an aquifer that is so over  
20 appropriated, and yet that aquifer is full?

21 A. Yes.

22 Q. Looking back to the May 22nd, 2018, letter from  
23 Alan King to David Barfield, if that is still  
24 before you. I believe Mr. Stucky asked you if  
25 that was an official statement of the City and

1           you indicated that it was.

2       A.    Yes.  It's not before me, but, yes.  I mean,  
3           everything is before me.

4       Q.    If you would take a moment and see if you can  
5           locate that letter in the exhibit books.  And  
6           you might look for a copy in the proposed  
7           correspondence tab in the City's black binder.  
8           You might go back about 121 pages in that  
9           material.

10      A.    I have it.  Thank you.

11      Q.    In that same letter, if you flip back to the  
12           next to the last page, which is numbered in the  
13           notebook 126, what was Alan King addressing  
14           there, in paragraph 14, for something that might  
15           be a permit condition?

16      A.    (Witness reviews documents).

17      Q.    In paragraph 14 next to the last page?

18      A.    Yes.

19      Q.    What does Mr. King express there in things the  
20           City is agreeable to?

21      A.    He is expressing the fact that the City is  
22           agreeing to an operating principle that native  
23           rights should be utilized prior to recharge  
24           credits being utilized.

25      Q.    So although it is, as you suggested not in the

1 ASR Phase II permit, and not in the chief  
2 engineer's draft proposed conditions, in this  
3 exchange of correspondence Mr. King was saying  
4 the City is agreeable to the condition; is that  
5 right?

6 A. That is correct. And I would reiterate that.

7 MR. McLEOD: Nothing further for the  
8 witness.

9 THE HEARING OFFICER: Mr. Oleen.

10 MR. OLEEN: No questions.

11 THE HEARING OFFICER: Mr. Stucky.

12 MR. STUCKY: I will keep my questions  
13 directly in line with those questions.

14 THE HEARING OFFICER: Thank you.

15

16 FURTHER RECROSS EXAMINATION

17 BY MR. STUCKY:

18 Q. First of all, with respect to that last comment  
19 that you indicated that the City has agreed that  
20 the operating principle that native water rights  
21 should be utilized prior to recharge credits.  
22 You have indicated that is, in fact, a condition  
23 the City would agree to. The City reviewed the  
24 draft order that is represented as DWR Exhibit  
25 1. Is that correct?

1 A. Yes.

2 Q. And red line changes were made to that document;  
3 is that correct?

4 A. I have a recollection of that, not the  
5 particulars, but, yes.

6 Q. Why didn't the City add in that to the order, if  
7 that was something the City thought should be  
8 part of the order? Or propose that to DWR at  
9 that time?

10 A. Sorry, I thought there was another attorney  
11 popping up. I don't know. Doesn't seem to make  
12 any sense to me as of this morning. I would be  
13 happy to put it in today.

14 Q. I would ask that you flip that you find the  
15 District's exhibit notebook Volume III.

16 A. (Witness reviews documents).

17 MR. STUCKY: And just to speed this up,  
18 can I ask my esteemed colleague with two arms to  
19 approach the witness and help find the  
20 documents?

21 THE HEARING OFFICER: That's fine.

22 MR. STUCKY: Exhibit 43 Page 61, maybe.

23 MR. McLEOD: Madame Hearing Officer,  
24 for the record, at this moment I would like to  
25 point out that the District is represented here

1           today by two enabled and licensed Kansas  
2           attorneys, and when a representative of the  
3           District need to approach the witness or  
4           communicate with the Hearing Officer, for  
5           purposes of compliance of Kansas law, I suggest  
6           that that be done by those licensed attorneys.

7                         MR. STUCKY: I am only half an  
8           attorney, I only have one arm.

9                         THE HEARING OFFICER: I think in the  
10          interest of time if we could have another set of  
11          arms helping Mr. Stucky, we'll do it. But  
12          generally, yes, I agree with you.

13                        (GMD Exhibit 43 was marked for  
14                        identification by the Reporter.)

15          BY MR. STUCKY:

16          Q.       So we are on Page 61 of Exhibit 43. And there  
17                    should be a map on Page 61 of Exhibit 43. Do  
18                    you see that map?

19          A.       Yes, sir, I do.

20          Q.       And if I were to tell you that that's an  
21                    official map that was generated by the KU Kansas  
22                    Geological Survey at the University of Kansas  
23                    and you see that notation on the map, would you  
24                    have reason to disagree with me?

25          A.       I would not.

1 Q. And if I were to tell you that's an official  
2 government document, would you have reason to  
3 disagree with me?

4 A. I would not.

5 Q. And if we were to flip to the very first, while  
6 still holding your thumb on Page 61, if you were  
7 able to flip to the first page, you would see  
8 that it's an Equus Beds Groundwater Management  
9 District Number 2 sustainability assessment that  
10 was completed by JJ Butler, Junior, Whitmore,  
11 Wilson with the Kansas Geological Survey; is  
12 that correct?

13 A. That is correct.

14 Q. So, in fact, it's an official government  
15 document?

16 A. Still is.

17 Q. Yes.

18 MR. STUCKY: I would move to admit the  
19 District's Exhibit Number 43 in to evidence.

20 THE HEARING OFFICER: Any objection?

21 MR. McLEOD: No objection.

22 THE HEARING OFFICER: GMD Exhibit 43  
23 will be admitted.

24 (GMD Exhibit 43 was marked for  
25 identification by the Reporter.)

1 BY MR. STUCKY:

2 Q. Just a moment ago Mr. McLeod asked you questions  
3 about the fact that if the City doesn't use its  
4 40,000 acre feet of native water rights in an  
5 existing year those, that water really goes  
6 away, was that the line of questioning?

7 A. No.

8 Q. Can you characterize the answer you provided in  
9 that.

10 A. Yes. Our right to withdraw that water goes away  
11 with the calendar year.

12 Q. But you would have that right to withdraw to the  
13 next year; is that correct?

14 A. We would have a different right the next year,  
15 right.

16 Q. So the right, what we are referring to is the  
17 right to withdraw the remainder of that 40,000  
18 acre feet goes away at the end of that calendar  
19 year, is that the testimony?

20 A. I better change to correct. Yes, correct.

21 Q. If we were to flip now to Page 61, and I guess I  
22 will just ask this in a very general sense,  
23 would you agree, from your time serving on the  
24 GMD Board, would you agree that other water  
25 right holders in the Equus Beds aquifer that

1           have water rights within the City's well field,  
2           would you agree that many of those users have  
3           also not used their entire authorized quantity  
4           of water in a given year?

5           A.    Absolutely.

6           Q.    And if I were just to tell you that if we look  
7           at Page 61, what this shows in red, the red  
8           number, if I were to tell you that that is the  
9           authorized quantity of water, oh, in a township,  
10          if I were to tell you the red is the authorized  
11          quantity in a township, would you have reason to  
12          disagree with me?

13          A.    I would not.

14          Q.    And if I were to tell you that the middle number  
15          is the amount of water that was actually used in  
16          a particular township, would you have a reason  
17          to disagree with me?

18          A.    I would not.

19          Q.    And would you also agree then that, if we were  
20          to scan through these numbers, almost, I believe  
21          actually every one of them, the amount actually  
22          used was less than the authorized quantity,  
23          would you agree with that?

24          A.    Yes.

25          Q.    And so, in other words, other users of the

1 District are also not using their entire  
2 authorized quantity; is that correct?

3 A. Still the case. It was a minute ago, too.

4 Q. Yet these other users of the District they are  
5 not getting a benefit for being good stewards of  
6 the aquifer; is that correct, in the sense that  
7 they are getting to divert to some sort of  
8 credit later? Would that be a true statement?

9 A. And they are not bringing water to the game.  
10 You have to take your water bottle, put it in  
11 their center pivot to save bringing water up of  
12 a water bottle from their center pivot to be  
13 able to move the water from one period to  
14 another year. What you are missing is the water  
15 bottle.

16 Q. Okay. I, and again, we are going to disagree on  
17 this point. I believe to me you just described  
18 a nature of a physical recharge credit. I am  
19 just asking a very simple question. If the  
20 irrigators in this room choose not to use all of  
21 their water, and they leave that water in the  
22 aquifer, are they able to then get a credit for  
23 that water they have left in the aquifer?

24 That's my question. That's the only question I  
25 am asking.

1 A. So the editorial part where you mischaracterized  
2 my mischaracterization I don't respond to?

3 Okay. What is your question?

4 Q. The question is, if the irrigators in the room  
5 leave water in the aquifer, they don't use their  
6 entire authorized quantity in a given year,  
7 should they receive a credit for having left  
8 that water in the aquifer?

9 A. No water rights holder should. Neither the City  
10 of Wichita nor others.

11 MR. STUCKY: No further questions.

12 THE HEARING OFFICER: Do you have any  
13 questions?

14 MS. WENDLING: No.

15 THE HEARING OFFICER: It appears that  
16 we are finished with Mr. Pajor. Thank you.  
17 Thank you for your cooperation. It is 11:35. I  
18 think I am going to suggest an early lunch  
19 break, unless anyone has a different suggestion.  
20 Okay. Hearing none, it's 11:35, let's return at  
21 12:45. We are now off the record.

22 (REPORTER'S NOTE: At this time,  
23 11:34 a.m., a lunch recess was taken, after  
24 which, 12:46 p.m., the following proceedings  
25 were held:)

1 THE HEARING OFFICER: We are back on  
2 the record after a lunch break. It's about  
3 12:45 and as I understand it, the Groundwater  
4 Management District is going to present one of  
5 their witnesses, who is only here today, so the  
6 other parties have agreed to take this witness  
7 out of sequence; is that right, Mr. Adrian?

8 MR. ADRIAN: That's correct, Your  
9 Honor. I call Masih Akhbari.

10 MASIH AKHBARI, PHD, PE,  
11 was thereupon called as a witness herein, and  
12 after having first been duly sworn to testify to  
13 the truth, the whole truth and nothing but the  
14 truth, was examined and testified as follows:

15  
16 DIRECT EXAMINATION

17 BY MR. ADRIAN:

18 Q. Please state your full name and address.

19 A. Masih Akhbari, my address is 529 Washington  
20 Avenue, Santa Monica, California 90403.

21 Q. What is your occupation?

22 A. I am a project engineer to Larry Walker  
23 Associates, and I recently founded a company  
24 called Global Water Resources Solutions,  
25 Incorporated.

1 Q. What graduate degrees do you hold?

2 A. I have a master's degree in environmental  
3 engineering and a Ph.D. in water resources  
4 management.

5 Q. And where did you earn your master's degree?

6 A. I received my masters from Amirkabir University  
7 of Technology and my Ph.D. from Colorado State  
8 University.

9 Q. Would you describe your professional experience.

10 A. I have been working on a wide variety of areas  
11 in water resources management, in both surface  
12 and groundwater. And reservoir river  
13 groundwater. And I have also coauthored a  
14 textbook on groundwater.

15 Q. I was going to ask you about that, have you  
16 authored other publications?

17 A. Yes. Aside from the textbook which is titled,  
18 Groundwater Hydrology Engineering Planning &  
19 Management, I have also authored over ten  
20 scientific papers, multiple technical reports  
21 and some other types of reports for memorandums  
22 that were in California.

23 Q. I assume you have given some talks and  
24 presentations on hydrology and water management?

25 A. I have. Yes. I have given multiple talks and

1 presentations either as an invited speaker or as  
2 the lecturer or I have submitted abstracts and  
3 given presentations. And I have also served as  
4 a chair of the American Geophysical University.

5 Q. Do you have teaching experience in civil  
6 engineering or water management?

7 A. Yes. I have been a teaching assistant and I  
8 have also co facilitated in disciplinary courses  
9 on water biology.

10 Q. Please describe your skills with regard to your  
11 experience, and more specifically in water  
12 management modeling.

13 A. So I have worked on so many different types of  
14 models, from writing the source codes or  
15 modifying source codes or using already existing  
16 platforms to build new models and linking  
17 different models together. So I have almost 15  
18 years of experience working with computers,  
19 water resources simulation models.

20 Q. How did you come to be here today?

21 A. I was asked by yourself to corroborate with you  
22 and I was given this task to review the  
23 documents associated with a groundwater flow  
24 model, and more specifically the USGS report,  
25 review the model itself, its performance and the

1 City's proposal to modify the ASR.

2 Q. Did you do that?

3 A. I did.

4 Q. Would you describe for those of us present what  
5 was entailed in your examination?

6 A. I did start my examination with reviewing the  
7 USGS report to learn how they have structured  
8 the model, the inputs they have used, the  
9 calibration process they have employed and also  
10 learned the model. And then continued with  
11 running the models, running other scenarios by  
12 updating initial heads in the model and also  
13 reviewing the City's proposal to evaluate the  
14 suitability of the USGS model to be applied in  
15 order to specified groundwater model levels.

16 Q. I understand that the USGS model was modified to  
17 some extent by the City?

18 A. Yes. Yes, I used the Burns & McDonnell that was  
19 modified.

20 Q. What conclusions did you draw from that review  
21 of the model?

22 A. Well, the model is a very good tool for basing  
23 skills planning. In other words, if you are  
24 going to make decisions on the total amount of,  
25 total volume of water that can be extracted from

1 the basin in a year, that could be used; but to  
2 use the model to specify water levels at the  
3 locations of specific wells, the model does not  
4 have that capability.

5 Q. I want to go back a moment, if you will open  
6 Volume V that is in front of you, and turn to  
7 what are marked as Exhibits 64, 65 and 66.

8 A. Which part?

9 Q. 64, 65 and 66. Start with 64.

10 A. Yes.

11 Q. What is that?

12 A. This is the expert report that I provided.

13 Q. The written report by you?

14 A. Yes.

15 Q. And what is, turn to 65 then and tell us what  
16 that is.

17 A. These are the simulated versus observed data  
18 that was referred to in one of the tables in the  
19 USGS report. It's on Page 89 of the report.  
20 And the link is available on that page, so I  
21 downloaded the data using that list. Which is  
22 similar to this time series, and in order to do  
23 my analysis and evaluate the performance of the  
24 modeling in comparison with the observed data.

25 Q. And then turn to tab 66.

1 A. Yes.

2 Q. And identify that, please.

3 A. This is a remodel letter that I wrote in  
4 response to one of the City's experts that had  
5 provided some feedback, or critiques, on my  
6 expert reports. And I provided what Luca  
7 DeAngelis, or what my rebuttal is.

8 MR. ADRIAN: I would like for those to  
9 be marked and admitted, permission of counsel.

10 THE HEARING OFFICER: Any objections?

11 MR. McLEOD: Just to the expert report  
12 itself as cumulative, because the witness will  
13 cover those issues in live testimony.

14 THE HEARING OFFICER: I think it would  
15 be helpful for me to have it, so I will allow it  
16 in. GMD Exhibits 64, 65 and 66 will be  
17 admitted.

18 (GMD Exhibits 64, 65 and 66 were marked  
19 for identification by the Reporter.)

20 BY MR. ADRIAN:

21 Q. Dr. Akhbari, the modeling that was done by the  
22 City used statistics or numbers from the basin  
23 in 1998. And I assume you looked at those and  
24 you also, as I understand, used figures from the  
25 year 2001?

1 A. Yes.

2 Q. Why did you do that?

3 A. Well, the 1998 data were model outputs from the  
4 model, they were simulated data. And later on  
5 in my analysis I could confirm the model mainly  
6 underestimates the groundwater levels. And 2001  
7 is the beginning of the year where observed data  
8 were starting to be acquired. And I used  
9 observed data to set initial heads at the  
10 levels, at the, or across the basin. And I ran  
11 them while observing the observed data and  
12 compared the two outputs to make sure that the  
13 model responds well. Overall, across the 38  
14 index wells, on average the 2001 water levels  
15 were 11.85 feet higher than 1998. And I wanted  
16 to, or see if the model responds correctly to  
17 those higher water levels. And I could confirm  
18 that.

19 Q. So by using the 2001 figures and starting with  
20 observed data what you came to was a more  
21 precise model output; is that correct?

22 A. More reliable outputs because they are observed  
23 data, as opposed to simulated data.

24 Q. You had an opportunity, did you not, to also  
25 examine the entirety of the proposal that the

1 City is putting forward today, did you not?

2 A. I reviewed the proposal.

3 Q. When you and I were talking about the use of  
4 this model for purposes of establishing index  
5 wells, you used an example of I think the  
6 temperature. The program model, as it is used,  
7 does a good job of figuring water levels over  
8 the total of the scope of the model, but not  
9 good for measuring individual wells; is that  
10 correct?

11 A. Correct, yes. And the example was, again for an  
12 example, if you are going to evaluate, or if a  
13 specific setting in the U.S. reaches freezing  
14 point, and you take, for example, the first of  
15 February, if you take the average air  
16 temperature across the U.S. and come up with a  
17 value that is like, for example, 35 degrees,  
18 plus minus two degrees of error, could we apply  
19 that average both to Chicago and San Diego?  
20 Obviously not. So the model, the statistics  
21 expert's USGS come to compare the performance of  
22 the model is root versus square, which takes the  
23 average of errors across the entire basin. And  
24 obviously that average is not applicable to the  
25 location of the specific draws.

1                   And what I did in my analysis is I  
2                   again downloaded the simulated versus observed  
3                   data, and compared those at the location of each  
4                   specific index low. And with that comparison,  
5                   obviously that comparison is more reliable  
6                   because then again it does compare apples to  
7                   apples. And with that comparison I concluded  
8                   that on average there is about 30 percent of  
9                   error at the location of each index level. And  
10                  that could be as high as even 68 percent of  
11                  error. And that's why that is one of the  
12                  reasons that I believe this model at its current  
13                  status cannot be used to set groundwater  
14                  elevations at individual wells.

15    Q.    And would you look at your report at figure 4  
16           and table 3 and explain that to us. That's at  
17           the end of your report.

18                   THE REPORTER: I need to fix my file on  
19                   the computer for a minute.

20                           (A short off-the-record discussion  
21                           was held at this time.)

22    A.    So I am going to start with figure 4 on Page 26  
23           of my report. Which is a copy of figure 40 of  
24           the USGS report. The graphs in this figure  
25           compare observed versus simulated results at the

1 location of monitoring results, about 20  
2 monitoring results. Even with a visual  
3 comparison we can see that the blue graphs, that  
4 show the simulated results, are mainly  
5 underestimating elevations, in comparison with  
6 the red graphs that show the observed values.

7 So, however, we cannot just rely on the  
8 visual comparisons, so I downloaded the data  
9 that I mentioned, which is included in Exhibit  
10 65 from table, the table on Page 89 of the USGS  
11 report. And table 3 on my report, on Page 17,  
12 provides a summary of that comparison. So  
13 column A shows the monitoring well number,  
14 column B shows the observation period. And  
15 column C shows the difference between minimum  
16 and maximum observed values over the observation  
17 period.

18 For example, let's choose well number  
19 741, the observation period is from 1952 through  
20 2008. So over this 50, about 50 years, the  
21 total difference between minimum and maximum  
22 water level observations has been 8.21 feet.  
23 Column D shows the maximum difference between  
24 observed versus simulated values. For the same  
25 well, the maximum difference is 4.95 feet. So

1 when we, and also column A shows the average of  
2 those differences, which is 3.03 feet  
3 difference.

4 So for this well, the maximum  
5 difference between observed versus simulated  
6 values is 60 percent of the total range of water  
7 level fluctuations over the past 50 years. And  
8 on average 37 percent. And this well, as shown  
9 in column H, is mainly underestimating  
10 groundwater levels.

11 So again, this process can be repeated  
12 for all wells. Out of the 20 wells, 12 of them,  
13 which are corresponding to 60 percent of these  
14 wells, are underestimating groundwater levels in  
15 the simulated results, and that was my  
16 conclusion from this table.

17 Q. So what I am hearing you say is that there is a  
18 variation from accuracy of around 60 percent to  
19 a range of low of 37 percent in those examples?

20 A. Yes.

21 Q. Also now would you momentarily turn in front of  
22 you, I have opened the proposal.

23 A. Yes.

24 Q. And I think it is City Exhibit 1, I believe.

25 And there is a map that's in front of you. What

1 page is that?

2 A. Page 217.

3 Q. Would you describe for those present what you  
4 were telling me earlier about the significance  
5 of those various areas, one to the east and the  
6 other to the west.

7 A. Of course. So let me get to the right page on  
8 my report as well. So I am going to use this  
9 figure on the City's proposal as a reference and  
10 refer also to figure 2 on Page 23. So of my  
11 expert report.

12 Q. Page 23.

13 A. So on Page 23 of my report, the blue graphs show  
14 model results from 1998 initial heads, basically  
15 the model that has been used to set the proposed  
16 levels. And the red graphs show the updated  
17 model results that have been, that the model has  
18 been modified using 2001 initial heads. Well  
19 number 23 is on the east side of the basin of  
20 this entity of the Little Arkansas River. And  
21 well number 24 is on the west side. So when we  
22 compared the two graphs for these wells, we see  
23 a very sharp drop in water elevation from the  
24 first stress period to the second one. Again,  
25 the only parameter that has been updated in the

1 model has been initial heads. This drop does  
2 make sense because water levels in the Little  
3 Arkansas River has probably been lower, and that  
4 causes, the model tries to balance out the  
5 groundwater versus the surface water levels.

6 So this confirms how sensitive the  
7 model is to water levels, especially in the east  
8 side, where the Little Arkansas River is. On  
9 the west side we see the updated and higher  
10 initial heads have followed the right trend and  
11 we do not see such drops, such large drop  
12 between the two elevations.

13 Q. How does this relate to the sensitivity of the  
14 program of the model, how does that relate to  
15 setting index levels in the wells?

16 A. So again, the especially the wells that are  
17 located on the east side, are very sensitive to  
18 the surface water levels. And an accurate  
19 introduction of those levels to the model is  
20 very vital, otherwise the model for sure is  
21 going to return inaccurate values.

22 And another thing that I evaluated,  
23 again it's slightly irrelevant to what you just  
24 asked, but since we already have this map in  
25 front of us, is the fact that 1998 elevations

1           were simulated results. Again, those simulated  
2           results do tend to underestimate water level  
3           evaluations. So the updated model with the 2001  
4           results I am going to refer to table 1 in my  
5           report. And also table 4. So table 4 on Page  
6           18 is a copy of table 210 of the City's  
7           modification proposal and it shows the index  
8           values that have used existing elevations versus  
9           modeled revisions to propose new water levels.  
10          New water levels.

11                         And as an example, index well number 10  
12           uses modeled results. And so now if we go to  
13           Page 13, table 1, it shows the differences  
14           between 1998 and 2001 initial heads. For the  
15           initial head of well number 10, it shows that  
16           the initial heads have been set 32 feet higher  
17           than the 2001 levels. So obviously when you  
18           start your model with such high elevations you  
19           are going to, the model is going to respond to  
20           the drought situation more severely, and show a  
21           lot lower water elevations. And that's one  
22           example. And that's the largest difference, but  
23           again, you can also compare other wells that  
24           have used the model elevations and see how the  
25           initial heads vary between the two data sets.

1 Q. Dr. Akhbari, based on your extensive education  
2 and modeling experience and writing  
3 presentations and dealing in this groundwater  
4 models, do you have a conclusion with regard to  
5 the basis of the current model as used in the  
6 proposal?

7 A. Well, again, the model is a good tool for basin  
8 level decision making and to identify the  
9 overall volume of water that can be withdrawn  
10 from the aquifer; but to make it suitable, make  
11 such predictions as sitting water levels at the  
12 location of index wells, and even referring to  
13 the USGS report itself, the model is incapable  
14 of doing so. And it does need more refinement  
15 and a lot longer comparison of simulated versus  
16 observed data in order to be able to confirm its  
17 performance.

18 Q. Did I understand you to say that the model, the  
19 USGS model itself, says it's not fit for  
20 measuring individual wells?

21 A. Correct. And I have also provided that in my  
22 report, that I have quoted from the USGS report.  
23 On Page 72 of the USGS report it says: That  
24 model results were evaluated on a relatively  
25 large scale and cannot be used for detailed

1 analysis such as simulating water level drawdown  
2 near a single well. And that's a quote from the  
3 USGS report.

4 Q. And if it were said that this model is the best  
5 tool available, is it still adequate?

6 A. Well, the key term here is available. If you  
7 are going to go to a car racing competition and  
8 you only have a truck, where sports cars are  
9 competing with each other, your best available  
10 tool is that truck. But is it suitable or  
11 available?

12 Q. All right.

13 MR. ADRIAN: I have no other questions.

14 THE HEARING OFFICER: Mr. McLeod.

15

16 CROSS EXAMINATION

17 BY MR. McLEOD:

18 Q. Dr. Akhbari, in your experience have you ever  
19 created a basin's scale groundwater level?

20 A. I personally haven't created a basin field  
21 groundwater model, but I created models for my  
22 student. And also in my book, one chapter  
23 explains groundwater modeling, specifically with  
24 MODFLOW, and I have contributed in writing that  
25 chapter, so I do know all the foundations of

1 modeling. I reviewed models and I served as  
2 court adviser for two master thesis on  
3 groundwater. Currently at LWA we are developing  
4 models, they are being developed by more junior  
5 staff and I am using the model results for to  
6 set management decisions and sustainability  
7 goals.

8 Q. So you have some experience with groundwater  
9 models, but you haven't actually created a basin  
10 scale groundwater model?

11 A. I personally have not, no.

12 Q. Are you familiar with the observation data  
13 within the USGS groundwater model?

14 A. Would you elaborate on that, what do you mean to  
15 me by that?

16 Q. So you indicated earlier in your testimony that  
17 you had reviewed this model and learned it, was  
18 this your first experience reviewing that USGS  
19 groundwater model?

20 A. No. USGS groundwater model, if you are  
21 referring to MODFLOW, MODFLOW has been around  
22 for decades. And I have used MODFLOW  
23 previously. I personally have not developed a  
24 basin scale groundwater model, but I have  
25 written a tutorial on how to develop a model and

1 for that I had to learn it and write it in a way  
2 that's understandable by students. The book  
3 that we authored is being sold across the globe.  
4 We finished the first edition, I just finished  
5 the second edition and submitted it to the  
6 publisher and the book has been taught at  
7 different universities here, and in other  
8 countries as well.

9 Q. So within the model, obviously there are data,  
10 as you have alluded to, that enable a model to  
11 do something; is that correct?

12 A. Correct.

13 Q. And one data set, the 1998 you described, as  
14 simulated data?

15 A. Yes.

16 Q. And in other data set you looked at, the 2001  
17 data, you observed as observation data?

18 A. Yes.

19 Q. And you know how that observation data was  
20 derived?

21 A. I received observation data from the District.

22 Q. So what the District gave you as the 2001  
23 observation data, you assumed that was correct  
24 and didn't ask how it was derived?

25 A. I assumed it was correct because I wanted to

1 evaluate the model response to hire water  
2 elevations.

3 Q. But you actually didn't have any role in  
4 deriving that data yourself?

5 A. I did not have any role in deriving that data  
6 myself.

7 Q. And beyond that you don't really know the method  
8 by which the District arrived at it before they  
9 provided it to you?

10 A. No, I did not.

11 Q. In your experience, what is the accuracy of a  
12 water level measurement device such as a water  
13 level tape?

14 A. You mean errors associated with that? With the  
15 measurements?

16 Q. Sure.

17 A. So there could be a lot of sources of error, so  
18 I don't have it on the top of my head what would  
19 be the range of error, but it could be, there  
20 could be error, but that's the most reliable  
21 source of data that we can use anywhere in any  
22 model. So we always on this we do want, we do  
23 want to do measure validation and on the  
24 measured we always rely the measured data. And  
25 verification of that data has been out of the

1 scope of my evaluation.

2 Q. So as again, with the term available and your  
3 truck and sport car analogy, you don't have a  
4 basis to really opine on the number of sources  
5 of error, or their scope, because you don't know  
6 how, whether these measurements were derived  
7 with a tape or whether they were derived by some  
8 other measure or how any of them were derived?

9 A. My task was to evaluate model performance, not  
10 verify data.

11 Q. So the data comes to you essentially unverified  
12 and your job was just simply to see how the  
13 model would react to the data?

14 A. React to the data.

15 Q. And does it follow from that, that you really  
16 don't know whether that observation data is more  
17 accurate than simulated data because you didn't  
18 verify any of it?

19 A. Again, I did not verify the data. I validated  
20 model response to that data. But since the  
21 data, the observed data, did follow the trend of  
22 the other data set, again, the model response to  
23 the observed data, followed the same trend. I  
24 could verify that. The data is acceptable. I  
25 could not --

1 Q. Because -- I am sorry, go ahead.

2 A. Let's say if the data is absolutely off, the  
3 model response cannot follow the same trend. It  
4 should provide you with a different hydrograph.

5 Q. So if I am understanding here, the simulated  
6 data is, has some inherent accuracies, but your  
7 basis for concluding that there is probably some  
8 validity to the observed data it follows the  
9 trend on the simulated data on the graph?

10 A. So when we compare the trend, we can compare.  
11 But the magnitude of those values, that's not  
12 what I can trust for 1998. I can trust the  
13 trend. Because the trend, again, is the  
14 simulated basin's response to the initial data.  
15 So the basin, the model is provided with a large  
16 set of different types of data, like pumping  
17 rates, recharge rates, precipitation,  
18 evapotranspiration, we provide the model at the  
19 very first timestamp with initial heads being  
20 1998 or 2001. Now, as of then, it is going to  
21 be the model response how the basin is simulated  
22 within the model. So when they both follow the  
23 same trend, that's reliable. But the magnitudes  
24 of the 1998 data, that's, that cannot be  
25 confirmed. For the 2001 data, you might want to

1 ask the, about the reliability of that data from  
2 the District, because again, I did not create  
3 that data.

4 Q. In your experience which would be more accurate,  
5 a water level measurement taken from 1939, with  
6 an unknown method from a non surveyed elevation,  
7 or water level measurement taken from 2008 with  
8 a calibrated electronic water level tape from a  
9 surveyed location?

10 A. Well, the second one has a more reliability  
11 associated with that. Again, you cannot confirm  
12 for sure that one is more accurate than the  
13 other one; but there is a lot more uncertainties  
14 associated with the 1939 data that was taken  
15 that you just described. So with that  
16 uncertainty I cannot answer that question with  
17 certain.

18 Q. In your experience how should the accuracy of  
19 the observed groundwater level data impact the  
20 targeted position of the modeled calibration?

21 A. Well, with the observed data when we have a  
22 longer set of observed data then we can, we have  
23 the chance to evaluate the model response to  
24 different conditions, physical conditions. And  
25 with that, using the two observed versus

1 simulated results, then we can play with model  
2 parameters. We usually run a sensitivity  
3 analysis to identify which parameters the model  
4 is sensitive to, and then we start adjusting  
5 those parameters to get the simulated values as  
6 close to the observed values.

7 Q. Using whatever you understand to be the standard  
8 for calibration, when is a groundwater model  
9 considered to be calibrated?

10 A. It depends for what purpose it's being used,  
11 whether it's academic level or whether it's  
12 basin level decision making or whether it's for  
13 a finer scale decision making, and for that we  
14 have different types of statistical methods that  
15 could be used. Root-mean-square error is one of  
16 them, but not the best one. There are so many  
17 metrics that could be used.

18 Again, at the academic level we usually  
19 use a set of three to five different metrics to  
20 evaluate different parts of the hydrograph.  
21 However, for the decision making situations like  
22 this, we do focus on specific events and we try  
23 to lower the error as much as possible for those  
24 specific locations.

25 For example, in one project that I

1 developed a simulation for a hydropower  
2 generating company, they were very sensitive to  
3 flooding events. And we did calibrate models  
4 also for every single flood event to make sure  
5 the model responds well to those events. But  
6 again, this model and how it's been calibrated  
7 it's been very well calibrated for a basin level  
8 scale, but not for a specific well locations.

9 Q. So as I am understanding your response, or  
10 actual basis level on decision making purposes,  
11 you would not consider a model calibrated unless  
12 you had reduced error to the maximum extent  
13 possible for that model?

14 A. Correct. We always try to reduce errors to the  
15 maximum possible, and that maximum possible, if  
16 it is out of a specific range in academia, that  
17 can be, there are different categories of  
18 acceptable, good, excellent or poor. That's in  
19 academia. With that you can use those metrics  
20 in your scientific paper to prove that the  
21 simulation model that you developed is reliable  
22 and now you can introduce your methodology to  
23 that model and get your results.

24 Again, that's for academia. But in  
25 real world applications we do have to focus on

1 the specifics, we cannot rely on, okay, the bias  
2 value at this location for this model is like  
3 .8, so it's correct. No. We do have to focus  
4 on specific events and specific locations  
5 depending on what the model is being used for.

6 Q. So that's, if you applied the metrics for  
7 academia, what difference would that make on  
8 your conclusion on calibration?

9 A. I am not sure if I understand your question  
10 well. What is this?

11 Q. If you were using this model for an academic  
12 purpose, to write a study paper, how would that  
13 impact your conclusion on calibration of the  
14 model and whether it's accurately or  
15 sufficiently calibrated?

16 A. Again, I would calculate it with different  
17 metrics and evaluate those values with ranges  
18 that have been introduced in the literature to  
19 say, to see if the, each specific metric is  
20 within an acceptable or better range or not.  
21 And that way I could tell if we could use this  
22 model or not in academia.

23 Q. When you are in the industrial setting, how do  
24 you determine that you have reduced error in the  
25 model as much as possible?

1 A. Because you are trying to, again, there are a  
2 lot of stakes associated with any decision  
3 that's made using modeling results. That's why  
4 you need to reduce the error values to the level  
5 where the model results can be acceptable, but  
6 all the parties that are using those model  
7 results.

8 It is impossible to get an error value  
9 of zero, so that's never going to happen. But  
10 it has to be as close as possible.

11 Q. And can you quantify that for me?

12 A. No, I cannot. It's case specific and it  
13 completely depends on where and when and how you  
14 are going to use that model results.

15 Q. So there is, I mean, there is really in that  
16 sense, not a definition of industrial  
17 calibration that's sufficiently standard for us  
18 to know from one model to another how that is  
19 met?

20 A. I cannot define anything, again, the model has  
21 to simulate the actual situation to the best, to  
22 the best extent possible. Again, if it's basin  
23 scale for that basin, if it's more local scale  
24 for that very specific location.

25 Q. How low do you determine if the model has

1 simulated to the best possible degree of  
2 accuracy? How do you know that you have  
3 minimized error to the maximum extent possible?

4 A. You need longer data, longer observed data in  
5 order to do that analysis. Without observed  
6 data, you cannot really draw that conclusion.  
7 And for that data you need longer, longer  
8 observed data.

9 Q. What was the length of the observed data set  
10 that you used here?

11 A. Well, again, as I downloaded the data, at  
12 different stations the data ends in 2008. And  
13 at different stations it starts from I think  
14 1939. I can give you a more accurate, yes,  
15 substations 1939, some stations 1952 and one  
16 station 1970, is the beginning of the  
17 observation. And with that, however, these are  
18 annual observed data, which means that all the  
19 seasonal fluctuations have been ignored. And  
20 when I say 1939 to 2008 it doesn't mean we have  
21 data for every year. Sometimes it's 1939, one  
22 observation and there is no observation until  
23 2000. And then there are like seven or eight  
24 observations after 2000. So it's not a  
25 continuous observed data.

1 Q. So also throughout the time scale for the  
2 observation of data, you have people taking  
3 readings as long ago as 1939; is that correct,  
4 presumably?

5 A. For the observed data you mean?

6 Q. Yes.

7 A. Yes, as provided in the USGS report for some  
8 wells the data goes back to 1939.

9 Q. And it would follow that whoever did that, they  
10 were using the technology available in 1939 to  
11 measure that observed data?

12 A. Yes.

13 Q. Do you know from your experience, over time from  
14 1939 to 2008, have technological methods to  
15 measure and observe water levels improved during  
16 that timeframe?

17 A. Yes.

18 Q. So within that time scale of observed data from  
19 1939 to 2008 would you expect there to be  
20 varying qualities of reliability in those  
21 measurements taken at different times in that  
22 time scale?

23 A. Yes. But it doesn't mean that all of their data  
24 is unreliable.

25 Q. And, likewise, because you really don't have the

1           particulars of how any of the measures were  
2           taken, somebody could have made errors in the  
3           more current, even with better technology?

4       A.    Yes.  Or the device might have failed.  Or the  
5           connection might have been disconnected.  There  
6           are so many sources of error.  But we do rely on  
7           the observed data in order to calibrate our  
8           models.  And without observed data you can never  
9           trust any model.

10     Q.    Once a model is calibrated can it be used to  
11           predict a groundwater level?

12     A.    Depending how it's calibrated and for what  
13           purposes, yes.  If it's been calibrated to  
14           reliably simulate groundwater levels, yes, it  
15           can; otherwise it cannot.

16     Q.    And that would assume your understanding of  
17           calibrated to an industrial decision making  
18           standard; is that correct?

19     A.    Yes.  And again, one measure that I used I  
20           compared the simulated error versus the range of  
21           long term fluctuations in the water level and  
22           compared that.  So the total range that over 50  
23           years or over a longer term, that the water  
24           level has fluctuated.  Now, the simulated  
25           results are, for example, I use well number 741,

1           which had about eight feet of total, over eight  
2           feet of total fluctuates over a period of 50  
3           years. And about five feet of maximum  
4           difference between simulated versus observed  
5           data. Which means that that translates in to 60  
6           percent of the total range of groundwater level  
7           fluctuations over 50 years. That's how much  
8           inaccurate the model results can be at this  
9           specific location of that monitor well. And  
10          that's why I believe that this model is, at its  
11          current setting, does not have the capability to  
12          make such decisions.

13        Q.    So your belief is that the USGS Equus Beds model  
14           that you reviewed cannot be used to predict  
15           groundwater levels at a specific location within  
16           the model?

17        A.    That's correct.

18        Q.    In your report you provided a table with  
19           statistics on simulated and observed water  
20           levels on table 3; is that correct?

21        A.    Correct.

22        Q.    Are the wells you selected in table 3 all within  
23           the ASR basin storage area?

24        A.    They are. I can tell you in a second. Most of  
25           them are, I am just going to confirm if all of

1           them are or not. Most of them are. So Page 25  
2           of my report that copies figure 34 of the USGS  
3           report, shows the location of those monitoring  
4           wells in red circles. And as you can see, most  
5           of them are within the basin storage area and  
6           the rest are surrounding that. But they are all  
7           within the model.

8       Q.   How many are not within the basin storage area?

9       A.   I don't exactly know, because I didn't have the  
10       Latin long information of those monitoring  
11       wells. So I just like using visual comparison.  
12       I can tell they are within the basin, the basin  
13       storage area, but I can't tell you how many are  
14       exactly inside or not.

15      Q.   Okay.

16      A.   But these are the 20 selected wells, these are  
17       the 20 wells that have been selected by the USGS  
18       report itself. And as you can see, I am  
19       referring to the USGS reports here.

20      Q.   Should wells outside the ASR basin storage area  
21       be used as a basis to predict or describe the  
22       accuracy of model predictions within the basin  
23       storage area?

24      A.   I prefer to use those wells that are within.  
25       They can still be used, especially for the index

1 wells that are located near the boundary, the  
2 boundaries of that, that area. Definitely the  
3 neighboring wells can have an affect on those  
4 wells. So it depends on the distance of those  
5 wells outside of that area. But if they are  
6 close enough definitely, if they are too far  
7 away, they might not have that much of an  
8 impact.

9 Q. Are the wells outside the basin storage area  
10 useful as a basis to predict the accuracy of  
11 model predictions within the basin storage area  
12 or near the ASR index wells?

13 A. Did I just answer this question? Again, like  
14 those wells that are outside of the basin  
15 storage area, and they are in the vicinity, they  
16 are within a distance, where the groundwater  
17 level fluctuations can impact the levels inside  
18 the basin storage area, yes, they can. If they  
19 are far away, they are not that useful. But all  
20 of these, these monitoring wells are, again  
21 visually, are either within the basin storage  
22 area or in the vicinity of that.

23 Q. Are the water level measurements that you looked  
24 at only the ones that are provided in table 3 of  
25 your expert report? Are those the only well

1 sites that you looked at?

2 A. Yes. Which are the same as those the USGS  
3 report used, and those are the ones that I had  
4 calibrated versus observed data.

5 Q. If one of the wells you analyzed in table 3 of  
6 your report were in the proximity to an index  
7 well, would that illustrate the accuracy of the  
8 model at the nearby index well?

9 A. Yes, it can, definitely.

10 Q. And if you look at the well location for well  
11 1038, is that located in proximity to index well  
12 number 16?

13 A. What is the number of the well again?

14 Q. 1038.

15 A. (Witness reviews documents). I can't locate it  
16 here. Do you mind if I open my laptop to  
17 magnify it?

18 THE HEARING OFFICER: Yes. I can't see  
19 it either.

20 A. And you said comparing it to which index well?

21 Q. Index well 16.

22 A. I can't really confirm these two maps, because,  
23 again, they are not.

24 Q. And if you don't have a basis to answer the  
25 question, that's fine.

1                   In table 3 of your report what was the  
2                   average absolute difference between observed and  
3                   simulated groundwater elevations?

4   A.   I have reported it, I think it's 37 percent. I  
5       need to go back to my report. I say that over  
6       30 percent on average.

7   Q.   How about for specifically that well site 1038?

8   A.   For 1038. Average is five percent, which is the  
9       lowest one followed by another well, which is 11  
10      percent. And then they go up higher. Basically  
11      that's the only single digits.

12   Q.   So based on that analysis of that well, on table  
13      3, what would we predict in terms of the  
14      difference in feet of water level on the average  
15      at the site of well 1038?

16   A.   At the site of 1038 the difference is about two  
17      feet, 1.98 feet difference on average.

18   Q.   And in the case of that well, in your  
19      professional judgment, do you think that that  
20      average residual of less than two feet is an  
21      acceptable calibration target for that site?

22   A.   Yes. For that site, yes.

23   Q.   In your expert report you supplied a hydrograph  
24      from the USGS model report for well 1038; is  
25      that right?

1 A. Yes.

2 Q. In the hydrograph of 1038, in what year is the  
3 highest difference between predicted and  
4 observed groundwater water occur?

5 A. Seems to be 1939.

6 Q. What about the period from 1957 through 2008,  
7 what was the average difference during that  
8 time?

9 A. That was the best match that the model had  
10 provided among all the wells.

11 Q. And if we look at that time specifically from  
12 '57 to 2008, what was the average difference for  
13 that, just that?

14 A. I don't have that value, but it seems to be very  
15 low.

16 Q. In your judgment is the model under predicting  
17 or over predicting groundwater levels in  
18 hydrograph 1038?

19 A. I don't draw any of those conclusions, I would  
20 say it acceptably simulates this specific wells,  
21 well, this specific well. But that's again, the  
22 only well that's being simulated.

23 Q. So that particular well you believe would be  
24 acceptably, that the model would be acceptably  
25 showing for prediction of groundwater levels at

1           that site only?

2       A.    Yes.

3       Q.    In table 3 how many wells have an average error  
4           of less than two feet?

5       A.    I think 11.

6       Q.    Out of how many?

7       A.    20.  However, two feet is acceptable for well  
8           1038, because the total difference between long  
9           term water elevation fluctuations is 37 feet.  
10          So out of 37 feet, if your error is two feet,  
11          it's acceptable.  However, in another well, for  
12          example, if the total range is four, which is  
13          for well 1448, 4.02 feet is the total long term  
14          difference in fluctuation, and 1.38 is the  
15          average error.  So that accounts for 34 percent  
16          of the total range.

17      Q.    And for that well you feel that would be  
18           unacceptable?

19      A.    That would be unacceptable.  Or if you are going  
20           to make the results for that specific well, the  
21           error needs to be taken into account somehow.

22      Q.    And let me ask the question this way because it  
23           may be shorter, out of all of those wells with  
24           less than two feet average error, do you believe  
25           that well 1038 is the only one as to which that

1 error is?

2 A. I could compare all of those with long term  
3 range and then I can answer. Do you want me to  
4 do it right now and answer your question?

5 Q. Yes, please.

6 A. Sure. 733 can be acceptable. 1037 can be  
7 acceptable. 1151. Maybe 1445, I am not sure  
8 though.

9 Q. Is that the entire list?

10 A. Yes. Sorry.

11 Q. I didn't know if you were still looking or if  
12 you were finished.

13 In your expert report rebuttal you  
14 state: While the model does predict water  
15 levels, not all of these predictions have the  
16 accuracy to be used as proposed in set adjusted  
17 water level values at the location of the index  
18 wells. What level of accuracy do you consider  
19 adequate for the purpose of setting adjusted  
20 water level values at the location of the index  
21 wells?

22 A. Again, that goes back to the range of  
23 fluctuations at that location and the percent  
24 of, I would say, again, it seems very, these  
25 are, these are decisions that are made through

1 long term negotiations between different parties  
2 in conflicts. These are not decisions that a  
3 modeler would make to identify those errors. So  
4 again, as a modeler, I can refer to an academic  
5 literature for scientific papers; but when we  
6 are in industry, again, I go back to my example  
7 of that hydropower generator. So any  
8 underestimation or overestimation of flood  
9 events could be translated in to several hundred  
10 thousands or millions of dollars in either loss  
11 or revenue for that. For that specific client.

12 So because of that they have a very  
13 sensitive on the model accuracy for those  
14 events, and that's why we try to minimize the  
15 errors as much as possible to the point that we  
16 partnered with the software developing team.  
17 And we started modifying the main source code of  
18 that software, along with the modification where  
19 we made to the model along with further  
20 collection of observed data, altogether to  
21 increase the accuracy of that model.

22 Here for this model, there are two  
23 parties in conflict. I, as a modeler, cannot  
24 tell you, the answer to that question, what  
25 would be the acceptable range. That range can

1 be negotiated by the two parties and accepted.

2 Or if there are more than two parties.

3 Q. So if few parties and a natural hearing officer?

4 A. Then the hearing officer can decide who is  
5 having further demands than possible.

6 Q. And I think you have acknowledged that a zero  
7 error rate is not possible for a model.

8 A. It's impossible. And any model that claims  
9 that, you should question the modeler, or the  
10 honesty or mental situation of that model.

11 Q. So as we were looking at a list of wells, with  
12 the lower, average error under two feet, you had  
13 mentioned specifically well number 1415 as it  
14 may be acceptable. What's the error rate as to  
15 that well?

16 A. You mean 1445, right?

17 Q. I am sorry, 1445.

18 A. So this is about one sixth of that, it's about  
19 15, 16, 17 percent error. So I would say again  
20 for academic evaluations, I would say less than  
21 10% of error, I would accept it. Between 10 and  
22 20 could be almost fair, but again in academia,  
23 but less than 10% I would consider a more  
24 acceptable range of error.

25 Q. Okay. In terms of your testimony that there was

1 a tendency in the simulated database model to  
2 underestimate levels, what's the significance of  
3 that for purposes of the ultimate result in the  
4 modeling for which the model was being used?

5 A. So we are using a model that mainly tends to  
6 underestimate water levels. Which means that it  
7 provides you with results that are lower, lower  
8 elevations than actual elevations. And then in  
9 the City's proposal we are using model results  
10 to set, to propose new index levels. So when we  
11 are using the results that are already being  
12 underestimated, providing you with lower  
13 elevations than what would happen in reality,  
14 and then we are proposing, therefore, what we  
15 are proposing is lower than what would actually  
16 happen. Does that make sense? Or do you need  
17 more clarification?

18 Q. So if I am understanding, the impact of the  
19 errors that you observed in the model and these  
20 underestimations would be that it would over  
21 present the severity of the drought impact, in  
22 your opinion?

23 A. That is correct, yes.

24 Q. In the table 3 wells, what is the head change in  
25 the wells from the up gradient to the down

1 gradient?

2 A. Would you please repeat the question.

3 Q. What is the head change in the table 3 wells  
4 from the up gradient to the down gradient?

5 A. Table 3?

6 Q. Table 3. The wells used in table 3.

7 A. Okay. So the location of the wells, I don't  
8 know which ones are gradient off the top of my  
9 head, but the range of differences, the maximum  
10 range of difference is between 3.09 and 37.01.

11 Q. Do you know what's the elevation difference?

12 A. We can refer to table 1. Oh, that's for the  
13 index wells. Yeah, we can refer to figure 4 and  
14 approximate the elevations using those graphs.

15 Q. Dr. Akhbari, is it your understanding that  
16 Wichita used the model to determine levels at  
17 individual wells?

18 A. Yes.

19 Q. And what was the source of that understanding?

20 A. Table 210 of the City's proposal it is provided,  
21 a copy is provided on Page 18 of my report. And  
22 the fourth column from the left is basis for  
23 proposed level, which is either existing or  
24 modeled.

25 THE HEARING OFFICER: I am sorry, what

1 page of your report was that?

2 THE WITNESS: 18.

3 THE HEARING OFFICER: Thank you.

4 Q. How do you constrain your parameter manipulation  
5 to reduce error during calibration?

6 A. I personally did not calibrate the model, but  
7 there are defined ranges for each parameter that  
8 you, you play with those values within those  
9 ranges, or experimental or using more local  
10 experts. It depends on the model being  
11 developed.

12 Q. Could you tell us what is the groundwater  
13 elevation at well 1692?

14 A. 1692? At what time?

15 Q. The highest. The maximum groundwater elevation  
16 that is shown for that well in the time scale of  
17 the data set that you have got.

18 A. Seems to be 1470.

19 THE HEARING OFFICER: I am sorry, which  
20 well?

21 MR. McLEOD: 1692.

22 THE WITNESS: Page 29 of my report.

23 Q. And the same question for the elevation at well  
24 Number 546.

25 A. 1354 almost, slightly lower than that.

1 Q. And so what would be the difference between the  
2 two elevations?

3 A. 120, almost 120 feet.

4 Q. You said that 11 wells in table 3 had less than  
5 two feet of error. What percentage of error is  
6 two feet divided by 120 feet?

7 A. The percentage would be less than 2%, maybe less  
8 than one and a half percent, but I don't know  
9 why you are comparing that. I mean, these are  
10 not two comparable values. In other words, you  
11 are comparing differences of water elevation in  
12 one well, with the total difference between  
13 water elevation in the entire basin.

14 In other words, let's say I stand here  
15 and someone stands on the Rocky mountains and  
16 can you compare our elevations? Our height?

17 Q. You can compare your height.

18 A. With the same level? I mean, one would be much  
19 taller than I am.

20 Q. Does it signify to you that there is a water  
21 level change within the basin storage area when  
22 you look at two wells that have those differing  
23 elevations?

24 A. Water levels change always, yes.

25 Q. Do you know if that's how the USGS calibrates

1 models?

2 A. Again, models are being calibrated by adjusting  
3 parameter values, different coefficient in the  
4 flow equations, and different parameters, maybe  
5 hydraulic conductivity. So they are being  
6 calibrated using these different parameters.  
7 And you calibrate the model to, and you compare  
8 water levels to evaluate the impact of those  
9 adjusted parameters on water level. You do not  
10 adjust water levels to calibrate the model.

11 Q. Was the City's modeling the only modeling study  
12 that you evaluated for purposes of your work in  
13 relation to the ASR proposal?

14 A. Yes.

15 Q. So you would not have looked at the modeling  
16 done by any of the other consultants that were  
17 providing opinions in the case?

18 A. No.

19 Q. And to the extent that the simulated values  
20 would underestimate water levels, would that be  
21 as true at the start of modeling as at the end?

22 A. That it is underestimating values?

23 Q. Yes.

24 A. I don't recall it exactly, but if we refer to  
25 the graphs provided in figure 4, which is from

1 Page 26 to Page 29 of my report, again, visually  
2 you can draw that conclusion that in the  
3 majority of the wells from the beginning to the  
4 end it's, the simulated values are mainly being  
5 underestimated.

6 Q. And from the work that you did were you able to  
7 form any conclusions of your own as to what  
8 point during an eight year drought, of the type  
9 modeled by the City, the water levels in the  
10 different index cells, would go below the 1993  
11 levels?

12 A. I don't recall that.

13 Q. That's not part of your expert opinion, is it?

14 A. It is not. And if I -- if I am asked to give  
15 that analysis it's an easy comparison, but I  
16 don't have the model results in front of myself  
17 to do that 1993 levels to answer that question.  
18 But again, I just, it just came to my mind,  
19 again, referring to the USGS comparison of  
20 simulated versus observed data, it does include  
21 1993, year 1993 again. And again, if you look  
22 at Page 26 through Page 29 of my report, or  
23 figure 40 of the USGS report that might be a  
24 little bit bigger and easier to follow. Then  
25 you can compare simulated and observed water

1 elevations in 1993. And again, that could be  
2 confirmed that the model is underestimating  
3 water levels in 1993.

4 Q. If the average error within a basin is 2.1, I am  
5 sorry, 2% if the average error in the basin is  
6 2%, is that model calibrated, in your opinion?

7 A. For the basin level decision making, yes.

8 Q. And could be used to predict aquifer behavior  
9 within the basin?

10 A. Please elaborate on aquifer behavior. If you  
11 mean the total volume of water that could be  
12 extracted or recharged in to the aquifer, yes.  
13 If you are referring to water elevations at the  
14 specific locations, no.

15 Q. Thank you.

16 MR. McLEOD: I don't have any further  
17 questions for the witness.

18 THE HEARING OFFICER: Mr. Oleen.

19 MR. OLEEN: No questions by DWR.

20 THE HEARING OFFICER: Ms. Wendling.

21 MS. WENDLING: Yes.

22

23 CROSS EXAMINATION

24 BY MS. WENDLING:

25 Q. Can you flip to your CV, which is at the end of

1           your report, Exhibit 64.

2           A.    Yes.

3           Q.    And in your professional experience you listed  
4           several years of work.  Are you able to identify  
5           which of these things that you have worked on  
6           include modeling?

7           A.    Well, modeling almost all of them groundwater  
8           modeling, the one, as a research assistant in  
9           Colorado State University.  Number 20.  
10          Groundwater available to supply domestic water  
11          demands.  And also the one the current position  
12          that I have at Larry Walker Associates, again,  
13          as part of my role in defining sustainability  
14          criteria for the groundwater sustainability  
15          plans, I have been using model results in  
16          reviewing some, some models that are being  
17          developed; but they are not finalized yet, but  
18          they are being developed by more junior staff.

19          Q.    And can you tell me what a groundwater  
20          sustainability plan is.

21          A.    Well, in California groundwater was not  
22          regulated before 2014, but in 2014 Governor  
23          Brown enacted a new law which is called SGMA,  
24          Sustainable Groundwater Management Act that says  
25          groundwater can best be managed locally.  And

1 they identified over 500 basins across  
2 California, and priorities had them based on  
3 like critical conditions, high priority, medium  
4 priority and low priority. Anything above  
5 medium priority they needed to develop a  
6 groundwater sustainability plan by 2020 or 2022,  
7 depending on the severity of the problem in that  
8 basin. And in that plan they should lay out a  
9 plan that exactly specifies how do you reach  
10 sustainability within 20 years.

11 And to reach sustainability they have  
12 identified six undesirable results that have to  
13 be avoided. So they have to show that within  
14 the next 20 years they are going to reach a  
15 point where these six undesirable results being  
16 depletion of groundwater, reduction of  
17 groundwater storage, seawater intrusion, land  
18 subsidence, depletion of surface water connected  
19 to groundwater and groundwater quality.

20 So these six undesirable results need  
21 to be avoided by 2040 for critical basins and  
22 2042 for medium and high priority basins. So we  
23 are developing the plans for four of the basins  
24 in California.

25 Q. And that includes developing models?

1 A. For these basins we have to develop models in  
2 order to, because you need to convince the  
3 Department of Water Resources that you, that  
4 your plan is effective, and you are moving  
5 towards sustainability, and you have to define  
6 management actions and some infrastructure  
7 changes in order to reach that sustainability.

8 To do so, you have to have a model to  
9 define these scenarios and evaluate whether or  
10 not they help you achieve your sustainability.

11 Q. You mentioned a tutorial on modeling in your  
12 textbook, do any of your other publications  
13 address modeling?

14 A. The ones that my students have published, yes.  
15 Number 4. And there is another one that's not  
16 listed here, and it has been recently accepted,  
17 and that's in far east so that is not included  
18 here.

19 Q. So in your work with modeling have you worked  
20 with groundwater vistas?

21 A. That's the interphase that I used to, to  
22 evaluate this model. So that's a graphical user  
23 interphase I use for one of the, one of the GUIs  
24 that you can use for the model.

25 Q. In your, well, as I understand it you evaluated

1 the fitness of the model and came to the  
2 conclusion that it's not fit for evaluating at  
3 an individual well location, but adequate at  
4 more of the basin level as a whole. Did you  
5 evaluate the fitness for determining or  
6 developing the minimum proposed minimum index  
7 level?

8 A. Again, those are similar things. So proposed  
9 index levels they have to identify an elevation  
10 at the location of a specific well. So again,  
11 the model, as my report concludes, and as the  
12 model, the model's documentation itself, the  
13 USGS 2013 USGS report, it explicitly mentions it  
14 is not suitable for performing such analysis.

15 Q. So your conclusion is that the model is not fit  
16 for establishing a minimum?

17 A. Not in its current state.

18 Q. When you were analyzing the performance of the  
19 model, to analyze the suitability, were you also  
20 looking at the specific input files?

21 A. Yes.

22 Q. Did you have any findings from them?

23 A. So I cross-checked the multiple parameters being  
24 introduced to the model being the  
25 evapotranspiration, recharge rates, layer

1 thickness, top and bottom of the layer, and to  
2 make sure that the independent data is being  
3 introduced to the model correctly and I could  
4 confirm that. Those were a part of my  
5 evaluation and I could confirm that the model  
6 structure is correct and it's been set up  
7 correctly for the large scale.

8 Q. Did you analyze the process used by the model to  
9 determine the minimum index levels?

10 A. The process that has been explained in the  
11 City's proposal, yes, I did review that.

12 Q. And what did you find in that process?

13 A. Again, I believe that this model cannot be used  
14 for setting a specific, setting elevations at a  
15 specific level, I could not confirm that.

16 Q. You mentioned root-mean-square error in your  
17 testimony. Can you explain to me what that is?

18 A. Yes. So the difference between one single  
19 observed versus one single, it's corresponding  
20 simulated value, it is called error. And over  
21 time or over space when you take an average it  
22 would be the mean error. So when we take the  
23 average over the entire time series, and over  
24 the entire basin, that would be the mean error  
25 for that basin. And then we took a root and

1 square it. Root -- and square and then take the  
2 root. Sorry. We square every difference, every  
3 error, and then take the average of the  
4 summation of all of these squares.

5 So that's why, that is why I claim that  
6 this is not a specific, the statistical metric  
7 that could be used to confirm the performance of  
8 a model that's being used for local analysis.  
9 That error is telling you how the model is  
10 behaving for the entire basin, not at the  
11 location of a specific wells.

12 Q. So if we look on Page 25, figure 3 of your  
13 report, how does your finding regarding the  
14 root-mean-square error translate when we look at  
15 it on this map?

16 A. Again, this is, this shows how spread the wells  
17 are in terms of calculating that error value.  
18 So the error value that you are getting is the  
19 error, is the value that represents this entire  
20 region. Not a specific well. And that's why I  
21 came up with table 3 that evaluates the model  
22 results at the location of a specific well, as  
23 opposed to giving you one, and again, I am going  
24 to go back to my example of weather temperature.  
25 Again, the average temperature of the U.S.

1 cannot be applied for one single city. We  
2 cannot say if today the average temperature of  
3 the United States is 35 degrees, then Miami and  
4 Chicago and New York, they are all 35 degrees.  
5 They should be treated differently.

6 Q. And are the sites you analyzed, are those the  
7 red dots or what's the significance of the red  
8 dots?

9 A. Again, it's a copy of the USGS report that shows  
10 the locations of the selected monitoring wells.

11 Q. So those were selected by USGS?

12 A. By USGS, yes.

13 Q. Okay. You have expressed there is a difference  
14 between the simulated levels and the observed  
15 groundwater levels. In analyzing the model in  
16 the proposal, have you seen that more pronounced  
17 in any other areas over the others or is that  
18 consistent?

19 A. It is not consistent, as shown in figure 4 at  
20 different well locations. It varies. Again,  
21 more tabular version of this figure is provided  
22 in table 3, so it does vary from well to well.

23 Q. Do you know why that is?

24 A. So many different things could cause this model  
25 setting. And again, so when we calibrate a

1 model for such purposes, then we focus on those  
2 specific locations and try to adjust model  
3 parameters in the vicinity of those locations.  
4 So that's how we can get more accurate results  
5 at the location of these wells or these index  
6 wells. But if you will come up with a generic  
7 value for parameter for an entire basin or a big  
8 region of the basin, then what you get, again,  
9 it can result in to these differences. So model  
10 parameters have to be adjusted more locally.

11 Q. Just the parameters, you don't need separate  
12 models?

13 A. You don't need separate models, no. You have  
14 the ability to have more finer resolution at a  
15 specific cells and courser resolutions at other  
16 cells. So you don't have to provide, you don't  
17 have to refine your entire model to make it  
18 finer of those, you can just focus on specific  
19 areas and refine. And you can refine resolution  
20 in portions of that model as opposed to the  
21 entire basin.

22 Q. So if you were trying to use the model in  
23 question, I don't know what we are calling it,  
24 to identify the impact at a specific well, what  
25 would you do?

1 A. Again, I would calibrate the model for those  
2 specific locations.

3 Q. Okay.

4 A. And that requires more observed data, and more,  
5 more technical work on calibrating the model.

6 Q. But it's possible?

7 A. It is possible.

8 Q. Without developing a new model?

9 A. No, you don't have to develop a new model.

10 Q. Did you, in your review and analysis, look at  
11 the storage capacity of the aquifer?

12 A. I don't recall it on the top of my head, but I  
13 am not sure, I maybe looked at the water  
14 elevations to the best I can remember. Oh, let  
15 me look at this. Oh, yeah. Here. Yes.  
16 Actually, not in the model, but in the model  
17 documentation. Again, like, I referred to the  
18 USGS report. So here, and I am actually glad  
19 you brought it up that's another source of  
20 concern that I had.

21 On Page 72 of the USGS report it  
22 compares the changing storage between Arkansas  
23 River and between the simulations for 2007 and  
24 2008. So in one year there is overestimation of  
25 storage. In another year, just by chance, in

1 those specific two consecutive years, there is  
2 an underestimation. So to be more specific, 15%  
3 of overestimation of storage in 2007 and 18% of  
4 underestimation of storage in 2008.

5 So when you sum up these two values it  
6 returns 3% because minus 15% plus 18% is 3%.  
7 But that is not, you cannot guarantee that that  
8 would be the case in every consecutive year. So  
9 if that error value goes the other way, and they  
10 have cumulative affect on each other, then two  
11 years can translate in to 32% or 33%. And ten  
12 years could translate in to over 100% error.  
13 Who knows? Or the other way. So these two  
14 years, by chance, balanced out each other. But  
15 that could not be the case all the time.

16 Q. And if you want to turn to Page 10 of your  
17 expert report from Exhibit 64.

18 A. Yes.

19 Q. Towards the bottom of paragraph 23.

20 A. Yes.

21 Q. You say: However, it is not clear why minimum  
22 groundwater levels required to maintain 30 MGD  
23 of physical ASR recharge capacity should be the  
24 basis to calculate the Modified Minimum Index  
25 Levels. Can you clarify what you meant by that?

1 A. Yes. In the City's proposal it says that, so I  
2 am going to start from the middle of the  
3 paragraph, but it says: This comparison  
4 indicated that the simulated groundwater levels  
5 presented in the end of the 1998 period were the  
6 best match for presenting the minimum  
7 groundwater levels required to maintain 30  
8 million gallons per day of physical ASR recharge  
9 capacity. But I could not find anywhere in that  
10 report, or the other reports that I evaluated,  
11 what is the basis of that 30 million gallons per  
12 day. So I don't know if there is an answer for  
13 that, but I couldn't find it.

14 MS. WENDLING: I have no further  
15 questions.

16 THE HEARING OFFICER: Mr. Adrian.

17 MR. ADRIAN: I have no questions.  
18 Given the nature of the last testimony for the  
19 last hour and 40 minutes, or whatever it's been,  
20 it seems unnecessary to ask this; but I would  
21 like to ask him to be recognized as an expert to  
22 give the opinions he has given.

23 THE HEARING OFFICER: Yes, I agree.  
24 And I believe that we are trying to have you out  
25 of here by 2:30. So five minutes to go. Any

1 more questions?

2 MR. McLEOD: I have just a few. I  
3 don't know that I will even need the microphone  
4 hopefully people can hear me.

5

6 RE CROSS EXAMINATION

7 BY MR. McLEOD:

8 Q. I want to make sure I understood an answer you  
9 gave to Ms. Wendling when you were asked about  
10 on your CV what it showed in terms of your  
11 personal experience creating a groundwater  
12 model. Was it your answer you personally did  
13 that one time as a research assistant at your  
14 Ph.D. institution in Colorado?

15 A. I have published one. That's something that has  
16 a publication on. But, no, I have worked on  
17 with, with mock flow, I learned the model to be  
18 able to write the corresponding chapter on the  
19 book. So I learned the model, worked with the  
20 model, learned it and provided a tutorial in my  
21 book on this. And I did work, I did develop a  
22 model again, not a basin level, but a smaller  
23 level, smaller scale model during my Ph.D. And  
24 beside from that I have been reviewing my  
25 students' models, I have been providing guidance

1 to my students to develop their models. And  
2 again, I have been using the models that have  
3 been developed by more junior staff within our  
4 company.

5 Q. So you have personally developed one groundwater  
6 model?

7 A. Yes.

8 Q. And then you have experience with models  
9 developed by your students and more junior  
10 associates where you work?

11 A. Yes. Yes. And again, because I do usually, we  
12 have in hydrology and water resources usually  
13 there are specific experts for surface water  
14 simulation or groundwater simulation or  
15 reservoir or watershed, so I am more, I define  
16 myself as a generalist because I have experience  
17 with a really wide variety of models in terms of  
18 water quality, water quantity in the rivers and  
19 reservoir operation, watershed scale,  
20 groundwater. That's what any of these models,  
21 if you are going to focus on one model I have  
22 developed a few of each. But I am a modeler, I  
23 am the one who links all of these models, who  
24 integrates all of these models and creates a  
25 series of linked models together. So I am the

1 one who understands the linkages between  
2 different models and can work with all of them.

3 Q. Have you, or junior associates working under  
4 your supervision, ever developed a groundwater  
5 model with a root-mean-square error less than  
6 5%?

7 A. Root-mean-square is not what we commonly use for  
8 our modeling purposes. We usually use a lot of,  
9 other metrics, such as gnat and she will suck  
10 cliff that provide a more detailed comparison of  
11 two time series, Nash-Sutcliffe is one of them,  
12 percent bias is one of them, which is much  
13 simpler than root-mean-square, R-2 is another  
14 one, which is another regression and the  
15 coefficient regression that you get, things like  
16 that.

17 Q. And for that reason, that you have used other  
18 metrics, are you not able to answer the question  
19 as I phrased it?

20 A. Again, from we have not used a specifically  
21 root-mean-square, I cannot answer.

22 Q. Can you tell us, Dr. Akhbari, how you came to be  
23 selected to do this work for the Groundwater  
24 Management District?

25 A. I think Tom had used my book in his previous

1 cases and that's how he knew me and how he  
2 approached me.

3 Q. Have you ever done any previous work for the  
4 District?

5 A. No.

6 Q. So Mr. Adrian basically he read your book and  
7 used your book and contacted you and asked could  
8 you come do some work for the District?

9 A. Yes. And he knew me through a mutual  
10 acquaintance, but that's how he got my contact  
11 information, but he had my book.

12 Q. Who was the future acquaintance?

13 A. Who was that?

14 Q. Yes.

15 A. Hannah Loft (ph).

16 MR. McLEOD: I don't have further  
17 questions for the witness.

18 THE HEARING OFFICER: Any other  
19 questions? Hearing none. Thank you, sir. You  
20 are excused.

21 THE WITNESS: Thank you.

22 THE HEARING OFFICER: I think this  
23 would be a good time for a ten minute break.  
24 Let's return at 2:40.

25 (REPORTER'S NOTE: At this time,

1 2:30 p.m., a recess was taken, after which,  
2 2:48 p.m., the following proceedings were held:)

3 THE HEARING OFFICER: We are back on  
4 the record now. It's about 2:47. And we'll  
5 resume with Mr. McLeod.

6 MR. McLEOD: Thank you. Just because  
7 we are on this heavy topic of modeling we'll go  
8 ahead and shift things around to bring Mr. Luca  
9 DeAngelis to the stand.

10 LUCA DEANGELIS,  
11 was thereupon called as a witness herein, and  
12 after having first been duly sworn to testify to  
13 the truth, the whole truth and nothing but the  
14 truth, was examined and testified as follows:

15  
16 DIRECT EXAMINATION

17 BY MR. McLEOD:

18 Q. Please state your name for the record.

19 A. My name is Luca DeAngelis.

20 Q. Mr. DeAngelis, do you have any university  
21 undergraduate and graduate degrees?

22 A. I do. I have a bachelors of science in  
23 geological engineering from University of  
24 Missouri-Rolla and a masters, MS, in civil  
25 engineering from the University of Kansas.

1 Q. Any professional licenses or certifications?

2 A. I am a registered professional engineer and  
3 registered professional geologist in Kansas. I  
4 am a registered professional engineer.

5 Q. Behind the expert reports tab in the lime  
6 colored notebook if you will flip back to the  
7 words of that section, is there a document?

8 A. Which color?

9 Q. The lime notebook, the green one.

10 A. (Witness reviews documents).

11 Q. Is there a document in that section of the  
12 notebook that looks like your curriculum vitae,  
13 or resume, depending on how you use that?

14 A. I am looking. I don't see it. I may need your  
15 help.

16 MR. McLEOD: May I approach the  
17 witness?

18 THE HEARING OFFICER: Yes.

19 (City Exhibit 15 was marked for  
20 identification by the Reporter.)

21 BY MR. McLEOD:

22 Q. Mr. DeAngelis, is looking at that document that  
23 I have had the reporter mark as an exhibit,  
24 City's 15, what is that document?

25 A. That's my CV or professional resume.

1 Q. Did you have a personal role in the generation  
2 of that document?

3 A. I did.

4 Q. And in terms of the experience described in that  
5 document, well, let me ask it this way. What  
6 would be the approximate date as of which that  
7 document was generated?

8 A. Within the last few months, I don't know the  
9 exact date.

10 Q. Was the information set forth there about the  
11 extent of your education, training and  
12 experience current as of the time the document  
13 was generated?

14 A. Yes, it was.

15 Q. And since the date that it was generated have  
16 there been any other material projects or work  
17 that you have done that would need to be added  
18 to update that?

19 A. Probably not that would impact or be relevant to  
20 the case.

21 MR. McLEOD: I will offer that document  
22 for admission.

23 THE HEARING OFFICER: Any objections?

24 MR. STUCKY: I guess I am unclear, is  
25 it just the CV of this witness or all the CVs?

1 We are a little unclear.

2 MR. McLEOD: Just the CV of this  
3 witness.

4 MR. STUCKY: No objection.

5 THE HEARING OFFICER: And was this 15;  
6 is that correct?

7 MR. McLEOD: Yes, City 15.

8 THE HEARING OFFICER: City 15 is  
9 admitted.

10 BY MR. McLEOD:

11 Q. Mr. DeAngelis, are you familiar with section 2.4  
12 of the City's proposal Groundwater and Modeling  
13 Set Up 1% Drought Simulation?

14 A. I am.

15 Q. And there are references there to the Equus Beds  
16 groundwater level, which was used for the  
17 proposal analysis. Did you have involvement  
18 during the use of that model for the proposal  
19 analysis in the evaluation of modeling input  
20 parameters, consideration of calibration and  
21 confirmation of results?

22 A. So while I was not the primary modeler I did  
23 have input.

24 Q. What was the extent of that input?

25 A. So I primarily assisted the primary modelers on

1 the project in evaluating the calibration status  
2 and also providing internal QAQC and then  
3 evaluation of the process used to evaluate.

4 Q. So for the record, what is the abbreviation for  
5 QAQC?

6 A. Quality assurance and quality control.

7 Q. So you were, in a sense, a significant sense, a  
8 peer review person assisting with the  
9 calibration and other issues of the modeling?

10 A. Yes, that's correct.

11 Q. What is a groundwater flow model and how are  
12 they developed?

13 A. So groundwater models are mathematical  
14 approximation of physical systems. They can be  
15 as simple as an equation, and as complicated as  
16 a computer model like, MODFLOW. They are  
17 developed using data that is collected in the  
18 field, those are measurements of water level,  
19 they are measurements of hydro conductivity,  
20 various different parameters that impact the  
21 availability of water to flow through an aquifer  
22 and calibrated, as was discussed in the previous  
23 testimony.

24 Q. Do you agree with the premise that typically the  
25 more site specific data is available the better

1 the model will be at making calculations that  
2 match the physical system?

3 A. Yes. Generally that's correct.

4 Q. What is the purpose of model calibration?

5 A. So model calibration is what you are trying to  
6 do when you are calibrating a model is to  
7 demonstrate that the model is capable of  
8 reproducing observed occurrences within the  
9 aquifer. So be that water level changes or  
10 stream flow measurements, whatever it is that  
11 you are trying to calibrate to, what you are  
12 trying to show and demonstrate is that the  
13 mathematical model that you put together  
14 reasonably approximates the physical system and  
15 measurements that have been made within that  
16 physical system.

17 Q. Have you reviewed the USGS materials that relate  
18 to their use in the work with this groundwater  
19 model?

20 A. I have.

21 Q. Do you know what the USGS estimated as the  
22 largest possible error in measurement of water  
23 level elevations?

24 A. I think they said around five feet.

25 Q. What's the purpose of a groundwater model?

1 A. So I explained what calibration was, which is  
2 demonstrating what has happened in the past, so  
3 no one really builds a model to show what's  
4 happened in the past, they build it to use in  
5 the future. Typically the purpose of a  
6 groundwater model is to predict an aquifer model  
7 to a new stress that will be introduced in to an  
8 aquifer.

9 Q. Please describe the process used to calibrate  
10 the Equus Beds groundwater model and to observe  
11 groundwater elevation measurements.

12 A. So the USGS went through a pretty extensive  
13 calibration process that's documented in their  
14 report. And they first started off with steady  
15 state conditions with no pumping. So steady  
16 state means that things are not changing with  
17 time. And what they did there was reproduced  
18 what they call predevelopment. So essentially  
19 when the aquifer had limited pumping within the  
20 aquifer they will produce that. Those  
21 measurements were pretty old. I think they were  
22 a little bit over 200 measurements available to  
23 do that calibration. The next step that they  
24 did was the transient calibration which takes on  
25 a period, a time period from the late 1930s to

1           2008. And so during that timeframe there is  
2           much more data available, more monitoring wells  
3           available. Obviously things are changing with  
4           time. During that timeframe they changed river  
5           stages and corresponding flows. They changed  
6           climatic conditions, depending on whether it was  
7           a drought or a wet year.

8                         They went through that whole process.  
9           That was the next step, that transient  
10          calibration. While they were calibrating, the  
11          calibrated both heads, the groundwater elevation  
12          and also the stream flows or changes in stream  
13          flow within the Little Ark and also the Arkansas  
14          River.

15         Q.    What were the model calibration goals?

16         A.    The goals that they had were less than 10%  
17                root-mean-squared error. And I think in the  
18                context of the head change across the model,  
19                which is about 200 feet, that translates in to  
20                about a 20 foot maximum head change, further  
21                error.

22         Q.    You were present for the testimony of Dr.  
23                Akhbari this afternoon, were you not?

24         A.    I was.

25         Q.    And although Dr. Akhbari had difficulty

1 generally quantifying a level of error for  
2 calibration, when we looked at a specific well  
3 he identified as a borderline maybe, I believe  
4 that he then answered that his approach to  
5 drawing a line would be less than 10% error.  
6 Does that seem to be consistent with the  
7 approach taken by USGS?

8 A. On a percentage error basis, yes, I think it's  
9 consistent.

10 Q. Describe the results of the steady state  
11 calibration.

12 A. Can you point me to the table number?

13 Q. I think we would be looking at figure 33 of  
14 Scientific Investigations Report 2013-5042,  
15 which would be an Attachment E to the proposal,  
16 which is part of Exhibit 1 in the black binder.

17 A. Black binder. Here we go. All right. So  
18 working backwards. Black binder.

19 Q. Attachment E.

20 A. Okay. (Witness reviews documents). So you  
21 asked about the calibration?

22 Q. Yes.

23 A. That's correct.

24 Q. Yes.

25 A. So that's summarized in table 10, and what they

1 did was to go through and break the model area,  
2 the entire model in to six different areas, and  
3 they developed a calibration error for each one  
4 of those six areas. Those ranged from a  
5 root-mean-square error of 1.4 feet to one that  
6 is about 8.35 feet. And are generally less  
7 than, in all of the other areas less than three  
8 feet. So table 10.

9 Q. Can you tell --

10 THE HEARING OFFICER: Pardon me, what  
11 page can I find table 10?

12 THE WITNESS: 52.

13 THE HEARING OFFICER: Thank you.

14 Q. Looking at the USGS materials, can you tell  
15 whether USGS compared the measured and modeled  
16 potential metric surface to ensure that the  
17 modeled hydraulic gradient was similar to the  
18 observed hydraulic gradient in magnitude and  
19 direction?

20 A. Yes, they did. And that figure I believe is  
21 figure 33, which is on Page 50 of the report.  
22 And so as I stated earlier, calibration of a  
23 model is really a stepwise process building  
24 lines of evidence that state or showed or  
25 demonstrate that the model that you are putting

1 together, the mathematical model, is  
2 representing the physical system.

3 What we have talked about so far today  
4 a lot is numerical errors and percentages and  
5 feet. A graphical depiction is a lot of times  
6 one of the first places we start off as  
7 modelers. We want to make sure that the model  
8 that we are producing reproduces the contours of  
9 the potential metric surface that we are  
10 observing. So this is another level of  
11 calibration that the USGS went through.

12 Q. And turning to figure 35, in that same body of  
13 materials, what does figure 35 relate to?

14 A. So 35, and that's on Page 53, 35 is what we call  
15 a scatter plot of residuals. And so what we are  
16 showing here is simulated groundwater levels on  
17 a Y axis and observe groundwater levels on an X  
18 axis. If you were to draw a straight line,  
19 basically a 45 degree angle from the lower left  
20 hand corner of that chart to the upper  
21 right-hand corner, that line would represent  
22 what we call a line of zero residuals, which  
23 would be a perfect model. So if all the data  
24 points landed on that line, we would have a  
25 model that has zero error in it. As we heard,

1 models that have zero error don't exist.

2 So this is a visual way to represent  
3 the level of error within the model. It shows  
4 the difference between the simulated and the  
5 observed groundwater levels. And like I said,  
6 you want to stay as close as you can to that  
7 line of zero residuals. And this scatter plot,  
8 in my opinion, represents a very good  
9 calibration.

10 Q. Is there a distinction between the level of  
11 water level calibration within the basin storage  
12 area compared to the remainder of the model  
13 domain?

14 A. I think in general, going back to table 10, the  
15 zones that were developed by the USGS are shown  
16 in figure 36, on Page 54, so you can relate  
17 those zones. And it also explained on table 10  
18 as to where they fall. I think in general the  
19 answer to that question is no, except for the  
20 north uplands, which is kind of an outlier in  
21 calibration. Its calibration was not as good.  
22 The rest of the model is well calibrated, and  
23 those values are all approximately the same.  
24 And the basin storage area, calibration is right  
25 there in terms of all the other five areas in

1 terms of numeric calibration status.

2 Q. Please describe the process used to calibrate  
3 the Equus Beds groundwater level model to  
4 observe stream flow measurements.

5 A. Yes. So there are two main streams that were,  
6 or where stream flow was tracked or stream flow  
7 was evaluated within the model. So what the  
8 USGS did is they looked at stream flow  
9 conditions in the Arkansas and the Little Ark.  
10 The results of those are presented also within  
11 the document, and let me find that figure. And  
12 then I will explain what the figure means.  
13 Figure 41, Page 65, and so what this is just the  
14 results of USGS's simulation that show stream  
15 flow pick up, essentially increases or decreases  
16 in stream flow, between measured gauges. So  
17 there are gauges. They are gauged stream flow  
18 locations amongst or within both of these rivers  
19 where they have measured values. The USGS then  
20 goes through and estimates what percentage of  
21 that stream flow is base flow. And so what  
22 percentage what they think is base flow is on  
23 these charts, presented as observed. And then  
24 the other ones, which would be the blue ones,  
25 are stimulated.

1                   So we are looking at comparing model  
2                   predicted base flow values versus observed base  
3                   flow values. And like I said, it's a pick up,  
4                   so it's a change in extreme base flow from one  
5                   gauge to another gauge. Here they are shown as  
6                   losing and in gaining, the Ark is losing. And  
7                   the Little Ark is gaining.

8       Q.   And for the record, when we use the term base  
9            flow in this context, what does it signify?

10     A.   Stream base flow is typically described as a  
11           contribution from groundwater in the stream. So  
12           if you took surface water run off,  
13           precipitation, all the other things that are in  
14           the stream flow, that contribute to the stream  
15           flow, base flow is what is in there at all times  
16           and typically the contribution from groundwater.

17     Q.   And then also in the context of the testimony  
18           you just gave the notion of a gaining or losing  
19           stream, what does that signify?

20     A.   So stream flow, in a gaining stream, the stream  
21           flow is increasing; and the losing stream, the  
22           stream flow is decreasing.

23     Q.   So in a gaining stream, looking at groundwater,  
24           is picking up water from the aquifer?

25     A.   Correct.

1 Q. And the losing stream contributing to the  
2 aquifer?

3 A. That's correct. So the Arkansas is contributing  
4 to the groundwater, and the Little Ark is  
5 receiving base flow.

6 Q. For purposes of model calibration, what's the  
7 percentage value chosen there as an acceptable  
8 ratio of R&S error for simulated base flow to  
9 total range and estimated base flow?

10 A. I believe what they used in the model, USGS used  
11 in the model was 20 percent for the stream flow  
12 calibration.

13 Q. Going to the sub topic of transient model runs,  
14 are variations in climatic conditions considered  
15 in the Equus Beds groundwater model?

16 A. Yes, they are. The Equus Beds simulates both  
17 dry years and wet years. So there are changes  
18 in the climatic conditions of pre charge and  
19 precipitation and then the resulting stream  
20 flows.

21 Q. So variations in river stage and stream flow  
22 they are also considered in the Equus Beds  
23 groundwater model?

24 A. Yes, that's correct.

25 Q. And did those river stages vary during the

1 transient groundwater model simulation based on  
2 the observed average annual river stage at each  
3 stage location?

4 A. Yes, that's correct. So that gives the USGS to  
5 simulate a wet year or a dry year based on  
6 observed data.

7 Q. Please give us your opinion on the adequacy of  
8 the Equus Beds groundwater model for use in  
9 evaluating hydraulic responses during a 1%  
10 drought.

11 A. In my opinion, I think this is very well  
12 calibrated groundwater model that is usable at a  
13 local scale, and is adequate for use in  
14 predicting water levels for a 1% drought.

15 Q. And what can you tell us about the normalized  
16 root-mean-square error in both the steady state  
17 and transient models?

18 A. So, it helps if we go back to that table. Go  
19 back to table 10. Again, all models start off  
20 with a goal in terms of the level of  
21 calibration. The stated goal for this project  
22 was below 10%. Which I believe was 20 feet, if  
23 I remember correctly. And as you can see in  
24 this table, in all the areas the resulting model  
25 calibration is much lower in terms of its error,

1 than what the prescribed goal was or the goal  
2 for the project was as to what the USGS  
3 established. So by that definition the model is  
4 calibrated. Also it is well calibrated based on  
5 modeling procedures. Typically we are shooting  
6 for anywhere between 5% and 10% normalized  
7 root-mean-square. Normalized means it's  
8 averaged out over the head within the model.  
9 The model has about 200 feet of head and these  
10 are all well within that range.

11 Q. And in your opinion, is that model an  
12 appropriate tool, a suitable tool, for  
13 evaluating regional hydraulic responses during a  
14 1% drought?

15 A. Yes, I believe it is.

16 Q. You were present during the testimony of Dr.  
17 Akhbari, and I believe he concurred with your  
18 view that the model is very well calibrated from  
19 the perspective of basin like decision making,  
20 but in his view there were problems attempting  
21 to apply the model to determine changes in water  
22 level at any specific well. Did his testimony  
23 shake your faith in your modeling results or the  
24 validity of those results?

25 A. No. No, it didn't. I think, as we heard

1 earlier, in the table that he developed there is  
2 20 wells. The average error for 11 of those is  
3 two feet. So we are talking about a very small  
4 error within the model. So, no.

5 MR. McLEOD: I don't have further  
6 questions for the witness.

7 THE HEARING OFFICER: Mr. Oleen.

8 MR. OLEEN: No questions.

9 THE HEARING OFFICER: Mr. Stucky.

10

11

CROSS EXAMINATION

12

BY MR. STUCKY:

13

Q. Mr. DeAngelis, is that how you pronounce your  
14 name?

15

A. It depends upon if you want the American or the  
16 Italian version.

17

Q. Which do you prefer?

18

A. DeAngelis is fine.

19

Q. Mr. DeAngelis, just a moment ago Mr. McLeod  
20 asked you some questions about your resume; is  
21 that correct?

22

A. That's correct.

23

Q. Now, where on your resume does it say that you  
24 actually helped to develop a groundwater model?  
25 Have you ever done that?

1 A. I have extensive groundwater modeling  
2 experience, yes.

3 Q. Have you actually ever helped write a  
4 groundwater model?

5 A. Constructive groundwater level?

6 Q. Yes. Help to develop it.

7 A. Many, many times, yes.

8 Q. What groundwater models have you helped  
9 construct as it relates to groundwater?

10 A. Do you want me to list them out?

11 Q. If you could list a few of them.

12 A. You could see on my CV, I will go through some  
13 of the more important ones. So I built  
14 groundwater model for the Nebraska DNR, that's  
15 the blue basin groundwater model. That's a  
16 basin scale model that the Nebraska DNR uses,  
17 still to this date, to determine basin  
18 appropriation status. So they look at stream  
19 flow depletions due to irrigation pumping.  
20 That's one.

21 You will see on the CV I also was  
22 contracted by the Missouri DNR to review the  
23 Ozark aquifer model. That's just a review of a  
24 model.

25 Also on the CV I developed a model for

1           McPherson. So the McPherson groundwater model  
2           was taking this model and carving out a section  
3           and making some changes to it to look at  
4           development of a new well field and a new water  
5           right for the City for McPherson for public  
6           utilities. We also looked at transport of  
7           chlorides in that model.

8                         Developed a second model for the  
9           Nebraska DNR, the lower Platte River tributary  
10          basin model. That model looks at extreme  
11          depletions over time in the eastern third or  
12          quarter of the State of Nebraska, due to  
13          irrigation pumping.

14                        I developed a regional scale  
15          groundwater flow model for the Omaha  
16          metropolitan utilities district. That was for  
17          permitting a new well field that pumps 100  
18          gallons per day, part of an environmental  
19          project that has been ongoing for 15 years. I  
20          have been involved in that groundwater model.  
21          Reviewed by multiple agencies. These are all on  
22          the CV.

23         Q. I will pause you for a moment. Of those models  
24             you just mentioned, were you the primary modeler  
25             on any of those projects?

1 A. On all of them, yes.

2 Q. But with respect to the City's model you are not  
3 the primary modeler, as I understand it?

4 A. For the City of Wichita?

5 Q. For the City of Wichita.

6 A. No, I am not. As previously stated I do QAQC  
7 work.

8 Q. So your work with respect to the City's model  
9 was limited to checking the inputs and doing  
10 basically some double checking of the City's  
11 work? Would that be an accurate statement?

12 A. Generally, yes. I was involved with our group  
13 of hydro geologists, so it's bouncing off ideas,  
14 coming up with ideas, asking questions,  
15 reviewing their work, making sure things  
16 conceptually make sense. Yes. It is QC,  
17 quality type control work, and also being part  
18 of a team and bouncing ideas off making sure  
19 that things make sense, that approaches being  
20 applied make sense.

21 Q. Did you actually help to write any portion of  
22 the City's proposal?

23 A. I did not.

24 Q. Did you actually personally generate any of the  
25 data that was utilized or relied upon in the

1 City's proposal?

2 A. No, I did not.

3 Q. And I think the next question is obvious, as far  
4 as any of the tables, or the spreadsheets that  
5 are in the City's proposal, which is the City's  
6 Exhibit 1, you didn't generate any of that  
7 information; is that correct?

8 A. That's correct. Just QC.

9 Q. Now, just a moment ago --

10 MR. STUCKY: Well, Mr. McLeod, what was  
11 the number of that last exhibit?

12 THE HEARING OFFICER: 15.

13 MR. McLEOD: I think we were up to City  
14 15.

15 BY MR. STUCKY:

16 Q. Now, just a moment ago --

17 MR. McLEOD: Yes. See I have, I have  
18 his expert report was 15.

19 THE HEARING OFFICER: Okay.

20 MR. McLEOD: If you mean the last  
21 exhibit that he was referring to, it's Exhibit  
22 1, the proposal itself, attachment E, part of  
23 the exhibit that he is in.

24 BY MR. STUCKY:

25 Q. I ask that you flip to attachment E of Exhibit

1 1.

2 A. Okay.

3 Q. Now, just a moment ago you were asked questions  
4 about calibration with respect to the City's  
5 model, would that be a fair statement?

6 A. It is.

7 Q. And I think first of all you were asked general  
8 questions about the calibration that was  
9 performed by the USGS; is that correct?

10 A. That is correct.

11 Q. Let me ask you this, were you part of the team  
12 with USGS that initially calibrated the model?

13 A. I was not.

14 Q. Now, with respect to attachment E, this is, in  
15 fact, a relatively lengthy report that was  
16 generated by USGS; is that correct?

17 A. That's correct.

18 Q. Did you help to write any portion of that  
19 report?

20 A. I did not.

21 Q. Did you help to perform any of the calculations  
22 that are relied upon in this USGS report?

23 A. I did not.

24 Q. Have you personally analyzed the data in the  
25 sense that you double checked the work performed

1 by USGS?

2 A. No, I did not.

3 Q. So just so I am clear, your testimony today is  
4 strictly based on you visualizing the tables  
5 that were developed by USGS and interpreting  
6 them for the record? Would that be an accurate  
7 statement?

8 A. Generally, yes. But I have also used as part of  
9 my work at Burns & McDonnell I have been  
10 involved in the Wichita accounting process so  
11 have, you know, have done work with the model  
12 through that. So not specific to this proposal,  
13 but I am familiar with the model. And as I said  
14 earlier, in my CV I have used this specific  
15 model to help build other models. So I have  
16 familiarity with the model. But in terms of the  
17 proposal, no, I have not.

18 Q. So as it relates specifically to the City's  
19 proposal, and it is a relates specifically to  
20 this USGS report you haven't come up with any of  
21 the data; is that correct?

22 A. That's correct, yes.

23 Q. You didn't perform any measurements; is that  
24 correct?

25 A. That's correct.

1 Q. You didn't run any individual calculations; is  
2 that correct?

3 A. That's correct.

4 Q. You didn't generate any tables; is that correct?

5 A. Yes.

6 Q. You didn't come up with any kinds of graphs; is  
7 that correct?

8 A. Correct.

9 Q. And, in fact, you didn't independently analyze  
10 the data that was relied upon in the USGS  
11 report; is that correct?

12 A. What do you mean by independently analyze?

13 Q. Independently verify the data used in the USGS  
14 report.

15 A. I did not, no.

16 Q. So I am going to ask you some questions about  
17 that data, and if you know the answers you can  
18 answer it. Now, just a moment ago you said that  
19 the goal of the USGS report was to have a  
20 root-mean-square error of 10% or less; is that  
21 correct?

22 A. Yes. That was my recollection.

23 Q. Okay. Now, root-mean-square analysis that type  
24 of analysis would generally be applied basin  
25 wide; is that correct?

1 A. It is applied in basin wide problems, yes, not  
2 only to basin wide problems, but, well, that's  
3 correct.

4 Q. As it relates to the USGS report, the 10% error,  
5 in that particular analysis, applied to the  
6 entire region that was being studied; is that  
7 correct?

8 A. It applies to the entire model domain, that's  
9 correct.

10 Q. But if you were to flip through this USGS report  
11 there is not going to be any analysis of any  
12 kind of error that would be determined at  
13 individual monitoring wells; is that correct?

14 A. That is typically not part of the model  
15 calibration.

16 Q. So that would be a correct statement?

17 A. That's a correct statement.

18 Q. Okay. I would ask, and just so we are clear, a  
19 moment ago you referred to a table 10. It's on  
20 Page 52.

21 A. Yes.

22 Q. As you walked through table 10 you indicated  
23 that the percentages of error in the grand  
24 scheme of things, in your opinion, weren't that  
25 major. Is that a simple characterization of

1 your testimony?

2 A. Yes, for all but one area, yes.

3 Q. Which area is that that you think there is  
4 different?

5 A. Well, I don't think there is a significant  
6 issue, it's just an outlier, the north uplands'  
7 calibration, zone 6.

8 Q. In your view with respect to the north uplands,  
9 would that be an acceptable error, in your view  
10 as a modeler?

11 A. It is. It is within their goal, so, yes.

12 Q. Now, just so I am clear, we mentioned the basin  
13 storage area, it mentions the Burrton area, the  
14 Arkansas River, the sand dunes, the south  
15 uplands and the north uplands. Those are  
16 regions within the aquifer; is that correct?

17 A. The regions within the model, yes.

18 Q. Regions within the model. So, in other words,  
19 this doesn't analyze specific monitoring wells;  
20 is that correct?

21 A. Yes. And that's not typically done in the  
22 calibration, but, yes, that's correct.

23 Q. So when the USGS calibrated their particular  
24 model they were looking to see how well, it was  
25 calibrated with a root-mean-square analysis for

1 individual regions, would that be an accurate  
2 statement?

3 A. I think so, yes.

4 Q. And as far as any more specific in depth  
5 analysis at a micro level, rather than a macro  
6 level, the USGS did not perform that work; is  
7 that correct?

8 A. They did not look at specific wells, no, or  
9 individual wells.

10 Q. Now, you also mentioned figure 35 in that  
11 document just a moment ago.

12 A. Okay.

13 Q. Now, with respect to figure 35, as you are  
14 sitting here today, do you have any idea which  
15 well or wells this figure is showing data for?

16 A. It says simulated versus observed ground wells  
17 for transient calibration. So it should be all  
18 wells used in the transient calibration.

19 Q. And you as you are sitting here you don't know,  
20 that's your speculation; is that correct?

21 A. I would say it's an informed yes.

22 Q. Now, why have they normalized the RMS, or  
23 root-mean-square error in this particular  
24 report?

25 A. Normalized root-mean-square is a very standard

1 way to calibrate a groundwater model. And the  
2 reason that you do that is like specific to this  
3 instance, their goal was 10%, 20 feet. And a 20  
4 foot error in a model that has 20 foot of head  
5 change is very significant. And 20 feet of  
6 error in a model that has 200 feet of head  
7 change is less significant. And 20 feet of  
8 error in a model that has 2,000 feet of head  
9 change is even less significant. So that's why  
10 you normalize the error to show what your  
11 average error is within the entirety of the  
12 model.

13 Q. Is that part of the reason why, at least the  
14 USGS model, in its unaltered form is not well  
15 designed to predict what would occur in an  
16 individual well? Is that one of the reasons?

17 A. I would disagree with that statement.

18 Q. Tell me how you disagree with that statement.

19 A. I disagree that you, you said it is not well  
20 designed to predict a water level at a specific  
21 well or something of that order? Yes, I don't  
22 agree with that.

23 Q. But again, the normalized root-mean-square  
24 analysis is generally designed for larger areas;  
25 is that correct? An analysis of larger regions,

1 would that be a true statement?

2 A. Not necessarily. It's a way to relate the  
3 error. So that you can, I mean you have to have  
4 a way, when developing standards and standard  
5 calibration metrics, you have to have a way to  
6 evaluate problems that are on different scales.  
7 So by normalizing that error it allows you to  
8 evaluate your level of calibration for a project  
9 that's over a small scale versus a project  
10 that's over a very large scale.

11 Q. With respect to figure 35, now, there is  
12 numbering of feet. And it says on the left-hand  
13 side, simulated groundwater level and feet  
14 above. What does that last portion mean to you?  
15 NAVD what does that mean?

16 A. Vertical data that was used.

17 Q. Explain what that means.

18 A. There are different vertical data sets that are  
19 used, so the NAVD is the vertical data that's  
20 used for this specific project. So what that is  
21 is the elevation standard, I guess if you want  
22 to call that. It's a surveying term. It's a  
23 way, so similar to like a state plain, or UT  
24 coordinates for XY, NAVD is what we use to  
25 standardize that elevation.

1 Q. Now, although if we look at figure 35, and again  
2 we are talking a difference of hundreds of feet  
3 and the difference is depicted in this figure;  
4 is that correct?

5 A. 300 feet.

6 Q. So we are talking a difference of 300 feet in  
7 this small figure, is that what we are talking  
8 about?

9 A. That's correct.

10 Q. So in analyzing this specific figure, if we were  
11 to zero in, and in a more localized sense, so we  
12 are talking the difference of 50 feet as the  
13 scale here, would that tell you a little more  
14 about the difference between the simulated  
15 versus the actual groundwater levels?

16 A. I mean, the statistics won't change and the  
17 error won't change, but you would be able to see  
18 it if you change the scale, sure.

19 Q. Just reading this figure 35, walk through for me  
20 the differences, numerically, between the  
21 simulated and the observed groundwater levels.  
22 Are you able to do that?

23 A. At a specific well? I mean, if you want me to  
24 pick out a data point, sure, I can do that.

25 Q. Are you able to pick out data points and tell

1 the difference between the simulated versus the  
2 individual observed groundwater levels?

3 A. Approximately, yes.

4 Q. And, but again, you haven't conducted any of  
5 those calculations?

6 A. No.

7 Q. So your approximations would be simply based on  
8 you looking at this graph and trying to estimate  
9 what that difference would be; is that correct?

10 A. Yes, that's correct.

11 Q. Would it be a fair characterization to say that  
12 in a lot of the locations the difference is at  
13 least 20 to 30 feet?

14 A. Some.

15 Q. Okay. Now, you indicated that after the USGS  
16 model was calibrated, that you also did some  
17 analysis of what work the City did to further  
18 calibrate that model. Is that what your  
19 testimony was?

20 A. No.

21 Q. Okay. So as you are sitting here today, you  
22 haven't done any further work to calibrate this  
23 model as it applies to the City's proposal?

24 A. No, I have not.

25 Q. And, in fact, you have done no analysis in that

1 regard; is that correct?

2 A. That's correct.

3 Q. So your testimony today is limited upon you  
4 interpreting the analysis, or the calibration  
5 analysis, that was performed by USGS; is that  
6 correct?

7 A. That's correct.

8 Q. And so the opinions you rendered just a moment  
9 ago are based upon that specific analysis; is  
10 that correct?

11 A. Yes, and my experience.

12 Q. Okay. You said earlier in your testimony that  
13 the data collected in the field, which was the  
14 actual data, you indicated that that is  
15 generally preferred, is that what your testimony  
16 was?

17 A. I don't remember saying that.

18 Q. Well, let me ask you this. Is data collected in  
19 the field, actual measurements, generally  
20 preferred over a simulated measurement?

21 A. For what purpose?

22 Q. For measuring groundwater levels, for example.

23 A. Sure. I agree with that.

24 Q. So, in a general sense, if the actual data, when  
25 you are measuring groundwater levels, is

1 different than the simulated values for  
2 predicting groundwater levels, would the actual  
3 measurements be preferred over the simulated  
4 measurements?

5 A. If there are actual and simulated then, yes, the  
6 actual would be preferred.

7 Q. Okay.

8 A. And just to clarify that, that is assuming the  
9 same stress conditions.

10 Q. You walked through several figures and you went  
11 through them relatively quickly and I think  
12 another figure that you talked about is figure  
13 41; is that right?

14 A. Well, let me flip to it. (Witness reviews  
15 documents). Yes, I did.

16 Q. Do you have any opinion, as you are sitting here  
17 today, regarding what the difference is between  
18 the percentage of the observed data versus the  
19 simulated data with respect to this particular  
20 graph? Do you have any idea what the average  
21 error was?

22 A. I remember reading that. I think their  
23 calibration target was 20 percent. I know they  
24 were below that. I don't remember the exact  
25 value. I would have to look it up.

1 Q. If I were to tell you that the simulated error,  
2 I am sorry, the error between the simulated and  
3 the actual, if I were to tell you it was 17  
4 percent, would you have a reason to disagree  
5 with that figure?

6 A. I would assume you read it correctly.

7 Q. And although these lines have some level of  
8 parallelism, there is still a wide variance  
9 between the two lines, would you agree with  
10 that?

11 A. Well, so these are, as I said earlier, this is  
12 an observed value, right? When you are  
13 measuring stream flow, you measure the actual  
14 flow in the stream. What they are showing here,  
15 what is the GS is showing here is observed,  
16 actual estimated base flow. So there is error  
17 in the estimated base flow. The difference  
18 between what they have shown as base flow and  
19 simulated flow, like you said, does have a  
20 difference. There is a difference. And the  
21 difference is for the Little Ark relatively  
22 consistent throughout the entire simulation.  
23 But it is important to understand there is  
24 inherent errors even in just the base flow  
25 estimates.

1 Q. In your estimation, based on your experience as  
2 a modeler, and you have been involved in  
3 different models, should the model be corrected  
4 to fix the error shown in this particular graph,  
5 in your opinion?

6 A. I guess it depends. Again, I would go back to  
7 saying the base flow is an estimated value. So  
8 I don't know what the confidence level was in  
9 estimates of base flow. And whether you would  
10 go back and recalculate or change parameters in  
11 the model to close the gap between the simulated  
12 and what's presented as observed would really  
13 depend on the level of certainty in that base  
14 flow analysis.

15 Q. Have you done any of those analyses?

16 A. I have not done analyses on this project, no.

17 Q. With respect to the difference on that table,  
18 that 17 percent error, in your experience as a  
19 modeler, as you are sitting there today, is that  
20 an acceptable difference in the error?

21 A. I have developed models that tracks stream flow  
22 that have error that high or higher, yes, I  
23 think it's acceptable.

24 Q. Does root-mean-square error common to be  
25 calculated temporally or spatially?

1 A. It's generally a spatial value.

2 Q. And so if it's a spatial value, that's a value  
3 where one combines a number of different wells;  
4 is that correct?

5 A. Yes, that's correct.

6 Q. Versus temporal where you are looking for an  
7 entire time period of one well, is that the  
8 difference?

9 A. I believe so.

10 Q. And so your testimony just a moment ago is that  
11 this model was designed to be a spatial  
12 analysis; is that correct?

13 A. No, not really. The model is designed to, by  
14 definition it is a transient model, so it has  
15 temporal variations in it.

16 Q. To determine whether or not there is an  
17 acceptable error, the model relies upon the  
18 root-mean-square error; is that correct?

19 A. That's their primary method for calibration, it  
20 is not their only method for calibration.

21 Q. At least as it relates to the root-mean-square  
22 error, that's looking at a spatial analysis; is  
23 that correct?

24 A. That's correct.

25 Q. As you are sitting here today, what additional

1 analysis, from a statistical perspective, was  
2 performed by the USGS to ensure that the model  
3 was calibrated to analyze levels at individual  
4 wells?

5 A. As I stated before, I didn't work on the USGS  
6 project, so I can't answer that. I don't know  
7 what the USGS did.

8 Q. And as you are sitting here today, what analysis  
9 did the City of Wichita perform, or any of the  
10 consultants for the City of Wichita, what  
11 analysis did they do to ensure that the error  
12 was acceptable at individual wells?

13 A. I am not aware of any.

14 Q. Just a moment ago Dr. Akhbari talked about why  
15 the model can be problematic as a tool for  
16 analyzing levels at individual wells. Do you  
17 recall that testimony?

18 A. I do.

19 Q. So based on the fact that you have no idea what  
20 USGS did in that regard, and you don't have  
21 knowledge of whether or not the City of Wichita  
22 analyzed that, and additionally, you didn't  
23 perform that analysis yourself, as you are  
24 sitting here today, you don't have reason to  
25 disagree with Dr. Akhbari's testimony in that

1           regard; is that correct?

2       A.    No, I don't agree with his testimony, so I do  
3           have reason to disagree with it.

4       Q.    And that opinion is based on just your 20,000  
5           foot view that his specific analysis was  
6           incorrect, even though you haven't performed any  
7           of that analysis yourself?

8       A.    I have reviewed his analysis, I also reviewed  
9           what USGS has done.  And the USGS they looked at  
10          trends in their hydrographs, so if you are  
11          talking about specific wells, they didn't  
12          quantify, statistically, that there were some  
13          statistical metric they were trying to meet at  
14          specific wells, but they talked about the trend  
15          analysis and the fact that their water levels  
16          simulated and observed generally had the same  
17          pattern.  And I would go back to previous  
18          testimony where it was quantified that 11 out of  
19          20 wells are within two feet on average and  
20          then, you know.

21      Q.    I will ask that you flip to Page 72 of that  
22           document in front of you.

23      A.    (Witness complies).

24      Q.    Now, toward the middle of, well, there is on  
25           Page 72 there is a summary called Model

1           Limitations, would you agree with that?

2       A.    Yes.

3       Q.    Now, in the Model Limitations, I would ask that  
4           you read numerical model limitation Number 2.

5       A.    The groundwater flow model was districtized  
6           using a grid with cells measuring 400 feet by  
7           400 feet. Model results were evaluated on a  
8           relatively large scale, and cannot be used for  
9           detailed analysis, such as simulated water level  
10          drawdown near a single well.

11      Q.    Do you agree with that statement as far as that  
12          statement being made by USGS, would you agree  
13          that they made that statement?

14      A.    They did make that statement.

15      Q.    And do you have reason to disagree with USGS in  
16          making that statement?

17      A.    No, I don't have any reason to disagree with it,  
18          but I believe that they are talking about  
19          specifically water levels in pumping wells.  
20          That's my interpretation of that limitation.

21      Q.    As you are sitting here today, can you  
22          demonstrate or prove to me that's what's being  
23          referred to in that statement?

24      A.    I cannot prove that, no.

25      Q.    Which circles back that to my question earlier,

1 as far as independent analysis or independent  
2 research or independent data collection or  
3 independent modeling, based on that alone, you  
4 don't have reason to doubt what Dr. Akhbari said  
5 just a moment ago with respect to his analysis  
6 with respect to individual wells; is that  
7 correct?

8 A. Again, I will say I don't agree with how it was  
9 presented, no.

10 Q. But you don't have any reason to disagree with  
11 the way that he went about his analysis,  
12 correct?

13 A. I do, yes, I do. I provided comments on his  
14 analysis. So, yes, I don't totally agree with  
15 his analysis.

16 Q. Let's walk through your concerns. What was  
17 your, what's one of your principle concerns with  
18 his analysis?

19 A. As I discussed earlier, the table that was  
20 generated shows an average error and a maximum  
21 error and never shows a minimum error; but the  
22 average error is two feet in 11 out of 20 wells.  
23 It's three feet in 18 out of 20 wells. So it is  
24 almost always less than three feet of error at  
25 all of those wells. What he did not answer,

1           that was asked, was what is a head change and  
2           there is over 100 feet of head change within  
3           those, within the locations of those wells.  
4           There is 115 feet, 120 feet of head change from  
5           the northern most well to the southernmost well.  
6           So you can't look at the results as a specific  
7           well and take that out of context. You can't,  
8           as a modeler, the USGS can't go through and  
9           individually adjust water level elevations and  
10          tweak parameters on a cell by cell basis to get  
11          the model to calibrate at a specific well, while  
12          also maintaining calibration on a regional  
13          scale. That's my principle disagreement. You  
14          can't look at individual wells in getting down  
15          to zero error in those individual wells.

16        Q.    So your concern, and I just want to make sure we  
17              are clear on what you are saying. Your concern  
18              is based on his general conclusion, general  
19              conclusions of his report, is that what your  
20              concern is with, just so I am correct?

21        A.    Yes.

22        Q.    But as far as the calculations he performed to  
23              reach those conclusions, you don't have reason  
24              to disagree with those specific calculations and  
25              the specific modeling that was performed by Dr.

1 Akhbari; is that correct?

2 A. No, I don't have any disagreement with the  
3 calculations.

4 Q. Okay. So as far as the numbers that, and the  
5 percentages that Dr. Akhbari spoke to, you don't  
6 have reason to disagree with any of his  
7 calculations; is that correct?

8 A. I don't disagree with any numerical values, no.

9 Q. I think just a moment ago, if I heard your  
10 testimony correctly, you said that the model is  
11 calibrated for an analysis on a regional scale.  
12 Was that your testimony a moment ago?

13 A. That's correct.

14 Q. So the model is best suited for a regional  
15 analysis, would that be an accurate statement?

16 A. It's a regional scale model, yes.

17 Q. And I think you have likely already answered  
18 some of these further questions I am going to  
19 have for you, I just want to, as I understand  
20 it, you, although ideas may have been bounced  
21 off you at different occasions by some of the  
22 members of the City, and some of the consultants  
23 for the City, as far as analyzing the modeling  
24 done by the City, you didn't help to perform  
25 that modeling; is that correct?

1 A. That's correct.

2 Q. You didn't help to spot check any of the data;  
3 is that correct?

4 A. I spot checked the results; no, but not the  
5 data, that's correct.

6 Q. Did you help double check to ensure that the  
7 inputs were being utilized correctly?

8 A. Yes, I did help with that, yes. That quality  
9 control type work, yes.

10 Q. As it relates to the model, do you have any  
11 opinion, or did you do any analysis with respect  
12 to the model, and how the 1% drought modeling  
13 was performed? And if I were to ask you a bunch  
14 of technical questions in that regard, would  
15 that be your level of expertise?

16 A. No. That would be more appropriate for others.

17 Q. And so as you are sitting here today, you don't  
18 have any opinion on how the 1% drought was  
19 calculated and how that impacted the City's  
20 model. Would that be a true statement?

21 A. That's correct, yes.

22 Q. As you are sitting here today, you don't have  
23 any kind of an opinion whatsoever on some of the  
24 initial inputs that were put in to the City's  
25 model, you didn't help to enter those in; is

1           that correct?

2       A.     Correct.

3       Q.     And you didn't help to perform those  
4           calculations?

5       A.     No, I did not.

6       Q.     So if I were to ask you very specific questions  
7           about the tables in the City's report, you  
8           wouldn't be able to answer those questions; is  
9           that right?

10      A.     No. I mean I understand generally how they are  
11           put together; but, no, not the details.

12      Q.     Are you able to provide, so would it also be  
13           unfair for me to ask you any kind of an opinion  
14           on stream flow and questions with respect to  
15           that, as far as the impacts to stream flow based  
16           on the City's model?

17      A.     Yes, I did not run the model, so, yes.

18      Q.     And you also wouldn't have any opinions on  
19           impairment; is that correct?

20      A.     Correct.

21      Q.     And you also wouldn't have any opinions on the  
22           City's accounting approach; is that correct?

23      A.     Yes.

24      Q.     And you would also not consider yourself an  
25           expert on any kind of simulation errors in the

1 City's modeling; is that correct?

2 A. Correct.

3 Q. And you also would not be able to answer any  
4 kind of questions with respect to water quality  
5 as it relates to the City's model; is that  
6 correct?

7 A. Yes, that's correct.

8 Q. And I am not sure if I asked this, but I think I  
9 asked, I might have asked this, you also can't  
10 answer any questions with regard to whether or  
11 not the City's proposal will impair individual  
12 wells, would that be a true statement?

13 A. Correct.

14 Q. And if I were to ask you a number of questions  
15 about the mechanics of how an aquifer  
16 maintenance credit is accumulated, and things of  
17 that nature, you wouldn't be able to answer  
18 those questions either; is that correct?

19 A. No, that's correct.

20 MR. STUCKY: I don't think I have  
21 further questions for this witness.

22 THE HEARING OFFICER: Okay. Ms.  
23 Wendling.

24

25

CROSS EXAMINATION

1 BY MS. WENDLING:

2 Q. I would like to draw your attention back to the  
3 limitations on Page 72 of the USGS report.  
4 Which is the attachment to Exhibit 1, the City's  
5 Exhibit 1, attachment E, Page 72. You have read  
6 or looked at model limitation number 2.

7 A. Yes, I see it.

8 Q. And I believe you said something about that your  
9 belief is that that applies to pumping wells.  
10 Can you clarify what you mean by that.

11 A. Yes. This is a model limitation that shows up  
12 in, maybe not all USGS reports but many USGS  
13 reports, specific to the cell size and  
14 attempting to use the drawdown to make any kind  
15 of analyses of the drawdown in a pumping well.  
16 That typically has been how that disclaimer has  
17 been applied.

18 Q. What is a pumping well?

19 A. A well that pumps water.

20 Q. Which would be most wells?

21 A. If they aren't monitoring wells or observation  
22 wells, sure.

23 Q. If I rely on a domestic well or for my sole  
24 source of drinking water, I rely on a pumping  
25 well?

1 A. That's correct.

2 Q. And this limitation says it can't be used for  
3 what will happen with a pumping well?

4 A. So it means you can't use the water level  
5 calculated in that model cell to tell you what  
6 the water level is going to be in the, in your  
7 well itself. Because of the size difference.

8 Q. Okay. Mr. Stucky asked you several questions on  
9 your work on the proposal.

10 A. Yes.

11 Q. Have you read the City's proposal?

12 A. Yes.

13 Q. So you are familiar with what they are  
14 requesting?

15 A. Yes, I did QAQC work on it.

16 Q. What you describe the QAQC work, you provide a  
17 lot of information about what the USGS did in  
18 terms of their calibration as documented in the  
19 USGS report. Can you describe what you worked,  
20 what work you performed as QAQC work.

21 A. Sure, it was typically looking at model input  
22 files, model output files, primarily though it  
23 was evaluating concepts. So meeting with the  
24 other hydro geologists on the project team and  
25 discussing concepts, how the accounting should

1 occur, how the accounting could occur, reviewing  
2 intermittently model results to make sure the  
3 model results makes sense, things like that.  
4 And reviewing documentation in the proposal in  
5 written form. So performing an editorial type  
6 review.

7 Q. And do you have a standard QAQC process?

8 A. Our company does, yes.

9 Q. Is that process documented?

10 A. It is.

11 Q. Was that process followed?

12 A. Yes.

13 Q. Were there any deviations from your standard  
14 process?

15 A. Not that I can recall.

16 Q. The calibration described in the USGS report  
17 referred to, that was done prior to the report  
18 being drafted; is that correct?

19 A. Can you restate that?

20 Q. So you described the calibration from the USGS  
21 report 2013-1542.

22 A. Yes.

23 Q. That calibration would have been done before the  
24 report was published?

25 A. Yes, that's correct.

1 Q. To your knowledge has the model been calibrated  
2 since that point in time?

3 A. I don't think it has.

4 Q. When, in your experience, is it appropriate to  
5 recalibrate a model?

6 A. I guess it depends, maybe if you are going to  
7 apply the model for a different purpose than  
8 what it was intended for, or perhaps if you  
9 accumulated significant amounts of new data.

10 Q. And do you have a way of quantifying a  
11 significant amount of new data?

12 A. Not really. It's different on every instance.  
13 I mean, typically you would only recalibrate if  
14 you have a new purpose for the model in mind.

15 Q. Are you familiar with the work done by the City  
16 of Wichita and Burns & McDonnell with the USGS  
17 report after this publication?

18 A. Which work specifically?

19 Q. Will you refer to the proposal, Exhibit 1, Page  
20 2-7.

21 A. Yes. (Witness reviews documents). Is that  
22 something you want me to look up?

23 Q. Yes, please. So Exhibit 1, which is the  
24 proposal, Page 2-7.

25 A. 2-7. Okay.

1 Q. And in the second paragraph, midway point:  
2 Since publication of the model Burns & McDonnell  
3 has updated the model since the years 2009  
4 through 2015 and continues on.

5 A. Yes, I am familiar with that work, yes.

6 Q. Any of the work described in this paragraph was  
7 it, is it your belief that recalibration would  
8 have been necessary after those changes?

9 A. No, not necessarily.

10 Q. How do you come to that conclusion?

11 A. So the USGS report was developed with the  
12 intention to come up with an accounting  
13 mechanism for ASR credits and the model was used  
14 to implement an accounting mechanism for ASR  
15 credits. So all you are really doing at this  
16 point in time, nothing has changed hydraulically  
17 within the aquifer, so all you are really doing  
18 is using the model that was calibrated for the  
19 purpose that it was developed for.

20 Q. So if the model is now being used to identify to  
21 propose new lowered minimum index levels, would  
22 that not be a different purpose than calculating  
23 recharge credits?

24 A. It's very, very similar. I still don't think  
25 anything significantly has changed within the

1 basin that would require calibration or  
2 recalibration.

3 Q. So a change in purpose in this case is not  
4 necessarily dictating a recalibration?

5 A. Well, we are still using the model for the same  
6 purposes. Even though the water levels have  
7 lowered, or potentially lowered, it's still the  
8 same accounting process. So really not a  
9 different purpose.

10 Q. So determining a new minimum index level,  
11 determining a water level is the same as an  
12 accounting process?

13 A. Well, it's part of that accounting process, so  
14 yes.

15 Q. Can you explain to me the correlation between  
16 accumulating a credit and a lower water level.  
17 I am not following you at all.

18 A. I mean, so the '93 levels is the base for  
19 withdrawal, right? So it's just the correlation  
20 is the lower, the lower water level is the more  
21 credits you would accumulate. We are not really  
22 proposing, fundamentally the model is not  
23 changing, we are not using the model for a new  
24 purpose. Like I said earlier, if you are going  
25 to change the purpose of the model, the model is

1 built for something, calibrated for something,  
2 and you use it for that purpose, I don't see a  
3 mandate or requirement to recalibrate it.

4 Q. So the purpose again of the model is an  
5 accounting methodology, and I want to look at  
6 the impact in the aquifer to water level in  
7 somewhat detailed level you believe still the  
8 model is fit for that purpose?

9 A. Yes, it's still fit for that purpose, yes.

10 Q. Have water levels historically drawn down to the  
11 proposed minimum index level?

12 A. I don't know the answer to that in detail. I  
13 know some, yes.

14 Q. Some have gone down to the newly proposed level?

15 A. No, the '93 is still lower levels, so not to my  
16 knowledge.

17 Q. So to your knowledge the water levels have never  
18 dropped below the '93 levels?

19 A. Not to my knowledge. And again, that is outside  
20 of my, I don't know all of the historical  
21 record.

22 MS. WENDLING: I have no further  
23 questions.

24 THE HEARING OFFICER: Mr. McLeod.

25 MR. McLEOD: Yes.

1 REDIRECT EXAMINATION

2 BY MR. McLEOD:

3 Q. Mr. DeAngelis, the kind of well by well  
4 calibration that has been suggested by Dr.  
5 Akhbari, is that the sort of a calibration  
6 that's typically done?

7 A. No.

8 Q. And I think you alluded to this somewhat, but  
9 what is the reason why it isn't typically done?

10 A. So the model consists of hundreds of thousands  
11 of cells, and parameters are brought in by  
12 groups based on geology, based on the  
13 information that we have about the area. And  
14 what he is suggesting would require cell by cell  
15 manipulation of parameters to reduce error. And  
16 it's really, frankly, frowned upon in the  
17 modeling world to do that.

18 Q. Are you aware of an industry standard, and you  
19 testified about what USGS used as their target  
20 room for error, are you aware of another  
21 industry standard that is considered a standard  
22 for when a model is calibrated?

23 A. Yes. There is ASGM has a protocol for a model  
24 calibration. There is well documented textbook  
25 groundwater modeling by Anderson and Woessner,

1           1992. Professor Anderson is a professor at the  
2           University of Kansas now, that establishes  
3           numerical calibration targets. Those targets  
4           are typically between five to 10% normal root  
5           square error. They go through other calibration  
6           processes.

7           Q. And would those calibration standards, in your  
8           opinion, be equally applicable to an academic or  
9           industrial exercise where the model is going to  
10          be used for a decision making purpose?

11          A. I think they are equally applicable, yes.

12          Q. Would you ever try to calibrate a groundwater  
13          model beyond the maximum measurement error?

14          A. Generally, no, I would not. I would not say  
15          never, but generally in practice I will not.

16          Q. Why not?

17          A. Because that implies a level of modeling  
18          precision beyond the accuracy of the data that's  
19          used to build the model.

20          Q. And to be clear, Mr. DeAngelis, when you said  
21          water levels had not dropped below the 1993  
22          levels, to your knowledge was that because that  
23          question has not been within the scope of your  
24          review?

25          A. That is correct.

1 Q. So it would be the case that you don't really  
2 know one way or the other as to that?

3 A. As I said, I am not entirely familiar with the  
4 historical record.

5 Q. If the model were calibrated on a well by well  
6 basis, and given the impacts that you have  
7 indicated, that would entail with manipulation  
8 of parameters index by index, would that mean by  
9 that exercise of trying to calibrate well by  
10 well you would then destroy the calibration of  
11 that model for the purposes of a basin wide use?

12 A. You could, you could severely impact it, yes.

13 MR. McLEOD: I don't have further  
14 questions.

15 THE HEARING OFFICER: Mr. Oleen.

16 MR. OLEEN: No questions.

17 THE HEARING OFFICER: Mr. Stucky.

18 MR. STUCKY: Thank you.

19

20 RE CROSS EXAMINATION

21 BY MR. STUCKY:

22 Q. Just a moment ago you said that if the model was  
23 calibrated to manipulate parameters cell by cell  
24 that could destroy the model for the purpose of  
25 analyzing basin wide trends; is that correct?

1 A. It could impact it for sure.

2 Q. Let me ask this. Could you calibrate two  
3 different models essentially, one that's  
4 calibrated for the individual cells, and one  
5 that's calibrated for the basin wide area, is  
6 that something that could happen?

7 A. It's something that could happen, it's not  
8 something that will be normal.

9 Q. So just because you destroy the model for a  
10 basin wide determination, because you are  
11 analyzing the individual cells, doesn't mean you  
12 couldn't have two different models; is that  
13 correct?

14 A. You could build two different models, but if you  
15 have to, if by modeling and manipulating  
16 individual cells you disrupt the overall  
17 groundwater flow field, then you really have to  
18 take a hard look at what you are doing on a cell  
19 by cell basis to justify whether that's  
20 accurate.

21 Q. Do you have, from a decision making standpoint  
22 or logistical standpoint as you are sitting here  
23 today, do you have any knowledge as far as why  
24 the City hasn't calibrated this model to analyze  
25 individual cells?

1 A. I do not.

2 Q. But just to be clear, theoretically it could be  
3 done; is that right?

4 A. Theoretically it could be done.

5 Q. Just a moment ago I walked through some things  
6 with respect to the City's proposal and asked if  
7 you had an opinion on, I just want to ask you a  
8 few more of those.

9 Do you have any opinion on the  
10 methodology for coming out with proposed  
11 contingencies in the City's model?

12 A. I do not.

13 Q. Do you have any opinion with regard to what the  
14 remaining saturated thickness would be at the  
15 end of an eight year drought?

16 A. If I remember right, high 80s low 90s typically  
17 on percentage.

18 Q. If I were to ask you very technical questions  
19 about numbers, you wouldn't have an expert  
20 opinion on that; is that correct?

21 A. I would have to look at the tables.

22 Q. Is that something that you generally are  
23 qualified to generate an expert opinion as you  
24 are sitting here today?

25 A. I am a hydro geologist, so I guess, yes.

1 Q. Is that something that you specifically  
2 analyzed?

3 A. Not in detail. Like I said before, I have done  
4 QAQC work on this and have been involved in the  
5 process, but I did not look cell by cell or well  
6 by well or what the saturated thickness was.

7 Q. You would have to perform further analysis to  
8 provide an answer to that?

9 A. I believe I would have to look at the table,  
10 yes.

11 Q. And you didn't perform any kind of calculations  
12 or analysis with respect to evapotranspiration;  
13 is that correct?

14 A. Yes, that's correct. We did not change the way  
15 that evapotranspiration was simulated other than  
16 just to adjust based on more up-to-date  
17 precipitation values.

18 Q. I heard your testimony a moment ago and I just  
19 want to make sure I understand. You were saying  
20 that when we look at a difference of two feet at  
21 an individual well, I think what your testimony  
22 was that in the grand scheme of things that's  
23 not that significant, is that what you were  
24 trying to say?

25 A. In a way, yes. It's not that it's not

1 significant, but it's not a huge deal when you  
2 are looking at an area where the water level  
3 changes by over 100 feet.

4 Q. If it's a two foot difference and the total  
5 historical fluctuations have only been four  
6 feet, is that two foot difference then  
7 significant in that context?

8 A. It's significant in the historical record of  
9 fluctuation, sure. But if you frame it on the  
10 saturated thickness of the aquifer, which is 150  
11 to 200 feet, it's not. So it depends how you  
12 look at it.

13 Q. So again, it depends on whether or not we are  
14 looking at an average over the entire aquifer or  
15 if we are looking at an analysis with respect to  
16 a specific well. Would that be a true  
17 statement?

18 A. That's a fair statement.

19 MR. STUCKY: No further questions.

20 THE HEARING OFFICER: Ms. Wendling.

21 MS. WENDLING: No further questions.

22 THE HEARING OFFICER: Mr. McLeod.

23 MR. McLEOD: Only just a few very.

24

25 FURTHER REDIRECT EXAMINATION

1 BY MR. MCLEOD:

2 Q. Mr. DeAngelis, you indicated to counsel's  
3 questions two models, one calibrated for the  
4 basin area, one well by well are possible but  
5 not normal. Why would that approach not be  
6 normal?

7 A. For a number of reasons. So to have one model  
8 and another model, then you would have to have  
9 any changes that are made in one model would  
10 then have to be made in another model to make  
11 sure that the changes are valid. It's not  
12 typical. I have over 20 years of practice and I  
13 have not seen it done. But really, if you are  
14 going to make a change in one model, it has to  
15 be hydraulically and hydro geologically  
16 justifiable. So you would want to carry over,  
17 even if it is on a small scale, carry that  
18 change over to the big model and find out what  
19 that does. And there is no physical leakage in  
20 MODFLOW, so we don't have to physically leak the  
21 models, or at least we didn't use to when this  
22 model was built. It was just an atypical thing  
23 to do.

24 Q. And you agreed with counsel that theoretically  
25 you could, you could build a model, calibrate it

1 well by well, you agreed theoretically it could  
2 be done. Would you ever recommend to a client  
3 of your consulting firm that they calibrate a  
4 model on that basis?

5 A. I believe there were over 350 wells in this  
6 model, so I would not advocate for that, no.

7 Q. Are there additional reasons why you would not,  
8 other than the number of wells?

9 A. So the purpose of a groundwater model is really  
10 to look at the overall flow in a basin. And to  
11 do that you need to have statistical metrics  
12 that look at the overall system. Can you in  
13 addition to that add something like that? Sure,  
14 you could. Again, I wouldn't advocate for it  
15 because the number of wells really makes it  
16 problematic. There are only a certain number of  
17 parameters we can adjust in a model and making a  
18 change to those model, parameters need to be  
19 justified based on a physical reason, and every  
20 change has an unintended reaction. So it would  
21 become a very difficult exercise to balance  
22 those micro changes with the macro and make sure  
23 that you get the macro right.

24 Q. In response to one of counsel's questions, you  
25 indicated that you didn't change any values for

1           evapotranspiration, just had updated some  
2           precipitation values. What is  
3           evapotranspiration?

4       A.    So evapotranspiration is just a loss in the  
5           groundwater from evaporation or from  
6           transpiration, which is the root zone pick up of  
7           the plants.

8       Q.    And in an aquifer with groundwater where the  
9           water you are looking at the underground  
10          reservoir, if you will, is subsurface, what  
11          assumptions are usually made for  
12          evapotranspiration?

13      A.    Penetration depths, so the depth with which that  
14          evapotranspiration stops is probably the  
15          principal assumption.

16      Q.    And one factor in that assumption is that the  
17          water is underground, it's not exposed to wind,  
18          sun, weather; is that correct?

19      A.    Correct.

20      Q.    And what's the other factor that relates to what  
21          the appropriate depth is in determining an  
22          assumption?

23      A.    Root zone penetration.

24      Q.    How far the plants go down?

25      A.    Yes.

1 Q. And what is the common level below which you  
2 assume you know about the evapotranspiration?

3 A. I believe it was ten feet in this model.

4 Q. And there was no reason in analyzing this basin  
5 area to make any departure from that, was there?

6 A. There was not, no.

7 MR. McLEOD: I don't have any further  
8 questions.

9 THE HEARING OFFICER: Mr. Oleen.

10 MR. OLEEN: No, Madame Officer.

11 MR. STUCKY: Just one question.

12

13 FURTHER RECROSS EXAMINATION

14 BY MR. STUCKY:

15 Q. You said that with respect to calibrating the  
16 model to examine individual wells, I think that  
17 you said there is over 300 wells, so that would  
18 be a difficult process. Was that your  
19 testimony?

20 A. That's part of the testimony, yes.

21 Q. Could that process be automated?

22 A. Partially, yes.

23 MR. STUCKY: No further questions.

24 THE HEARING OFFICER: Ms. Wendling.

25 MS. WENDLING: No further questions.

1 THE HEARING OFFICER: Any other  
2 questions for this witness? Okay, seeing none,  
3 sir, you are excused.

4 THE WITNESS: Thank you.

5 THE HEARING OFFICER: It's about 4:15.  
6 Do we want to begin the next witness, Mr.  
7 McLeod?

8 MR. McLEOD: I would say the next  
9 witness probably will not be a long witness, but  
10 I don't think we would be able to get through  
11 his testimony in that amount of time either.

12 THE HEARING OFFICER: Our landlord  
13 needs us out of here in about 20 minutes.

14 MR. BOESE: Could we go off the record?

15 THE HEARING OFFICER: Off the record.

16 (A short off-the-record discussion  
17 was held at this time.)

18 THE HEARING OFFICER: Back on the  
19 record. And Mr. McLeod will proceed within the  
20 time we have left today.

21 MR. McLEOD: City will next call Mr.  
22 Don Henry.

23 DON HENRY,  
24 was thereupon called as a witness herein, and  
25 after having first been duly sworn to testify to

1 the truth, the whole truth and nothing but the  
2 truth, was examined and testified as follows:

3  
4 DIRECT EXAMINATION

5 BY MR. McLEOD:

6 Q. Please state your name for the record.

7 A. My name is Don Henry.

8 Q. Mr. Henry, do you hold any degrees from  
9 universities or technical schools?

10 A. Yes, I do. I have a bachelor of science in  
11 biology from Mid Western State University in  
12 Wichita Falls, Texas. And it also includes a  
13 minor in interdisciplinary sciences.

14 Q. Do you maintain any professional licenses or  
15 certifications?

16 A. I have a certification in public administration  
17 through Wichita State University. And I am a  
18 registered Public Health Sanitarian through the  
19 Joint Credentialing Committee of Sanitarians and  
20 Kansas Environmental Health Association.

21 Q. Are you employed?

22 A. Pardon me?

23 Q. Where are you employed?

24 A. I am the assistant director of public works and  
25 utilities for the City of Wichita, Kansas.

1 Q. How long have you been with the City of Wichita?

2 A. Since 1998.

3 Q. What positions have you held with the City  
4 during the timeframe from 1998 to present?

5 A. I have been the assistant director since 2011,  
6 from 2007 to 2011 I was the division manager of  
7 the Environmental Health Division. Prior to  
8 that I was supervised the water quality section  
9 for the joint City County Health Department and  
10 prior to that I was an environmental health  
11 inspector.

12 Q. What functions of the utility are under your  
13 supervision in your current role?

14 A. I provide senior management level support for  
15 the water and wastewater utilities for storm  
16 water management and for the portions of  
17 environmental health that involve groundwater  
18 remediation and groundwater protection,  
19 specifically the permitting and regulation of  
20 personal use and lawn and garden, private and  
21 domestic wells, in other words.

22 Q. Is protection and plumbing division under your  
23 supervision?

24 A. It is. That's part of the water utility, yes,  
25 sir.

1 Q. In the course of your work for the City have you  
2 ever had occasion to deal with water supply  
3 issues?

4 A. Yes.

5 Q. In the course of managing the Wichita water  
6 utilities water treatment activities, do you  
7 have to consider the availability of water from  
8 different sources and supply and also the  
9 quality and chemical characteristics of that  
10 water?

11 A. Yes.

12 Q. Do you have to consider, for supply planning  
13 purposes, which water sources would be reliable  
14 sources during a drought?

15 A. That's an important component, yes.

16 Q. As assistant director of utilities, have you  
17 been involved in meetings, discussions and staff  
18 work relating to city water supply planning and  
19 drought response planning?

20 A. Many of them.

21 Q. Do your responsibilities extend to supervision  
22 of the city staff to perform the modeling  
23 activity to simulate drought response scenarios  
24 and the impact of proposed adjustments to the  
25 City's integrated management of water resources?

1 A. It has included that, yes.

2 Q. In 2011 when you became assistant director of  
3 utilities, was the city experiencing the impact  
4 of a drought?

5 A. Yes.

6 Q. What do you remember about the beginning and  
7 duration of that drought?

8 A. In roughly 2011-2012 Cheney was very stressed,  
9 it fell, I would like a guess here, around 50  
10 percent full at that time. And we were working  
11 through developing a drought response plan, how  
12 we would manage through the drought. And then  
13 it was sometime in 2013 when significant  
14 rainfall refilled Cheney reservoir.

15 Q. Do you recall if during that 2011 and '12  
16 drought, any of the water levels in any of the  
17 index cells in the aquifer fell below the '93  
18 levels?

19 A. Not to my knowledge.

20 Q. Did the City draft some new policy initiatives  
21 because of that drought?

22 A. Drought response plan.

23 Q. Please turn in the purple binder in the document  
24 of Pages 60 and 61 behind the tab drought  
25 response.

1 A. (Witness reviews documents). Just to confirm,  
2 you said 60 and 61?

3 Q. 60 and 61.

4 (City Exhibit 16 marked for  
5 identification by the Reporter.)

6 Q. Mr. Henry, the document that I have had marked  
7 as Exhibit 16, for cleanup purposes, is the  
8 printing that occurs on the back of Page 61 part  
9 of this document (indicating)?

10 A. It is not.

11 Q. And, likewise, the duplex printing that appears  
12 on the back of Page 60, is that part of the  
13 document (indicating)?

14 A. It is not.

15 Q. Okay. And with respect to the pages 60 and 61  
16 themselves, what is the document on those two  
17 pages?

18 A. This is a City of Wichita City Council meeting  
19 agenda report.

20 Q. Dated what?

21 A. October 8th, 2013.

22 Q. Is this a standard form of report that's used to  
23 report agenda items to the Wichita City Council?

24 A. It is.

25 MR. McLEOD: I will offer the exhibit,

1 City 16 for admission.

2 THE HEARING OFFICER: Any objections?

3 Okay. City Exhibit 16 will be admitted.

4 BY MR. McLEOD:

5 Q. Mr. Henry, does it appear from this report that  
6 a plan was revised after an earlier version was  
7 considered in the proceeding, and deferred for a  
8 week?

9 A. Yes, it does. The agenda refers to unfinished  
10 item, this would be a follow-up. And it also  
11 says on October 1st, 2013, the city staff  
12 presented a proposed a drought plan and  
13 ordinance that included phase implementation of  
14 water reduction strategies over four stages.

15 Q. You have been present, yesterday and today  
16 during the hearing, and seen a discussion of a  
17 lot of pieces of presentations to the City  
18 Council relating to drought. Is this action on  
19 October 8th, 2013, and the components described  
20 in the agenda report representative of the final  
21 version of the drought response plan that the  
22 Council actually approved?

23 A. I believe that to be true, yes.

24 Q. In this version how many stages of drought  
25 response measures were there?

1 A. There were four.

2 Q. What's the first stage of drought response  
3 measures?

4 A. It's a voluntary conservation stage.

5 Q. What would cause it to be triggered and become  
6 operative?

7 A. When a 12 month smoothed average of the  
8 elevations of Cheney Reservoir fell below 90  
9 percent.

10 Q. What's the second stage of drought response  
11 measures?

12 A. There are mandatory restrictions in place for  
13 outdoor watering limiting lawn and garden  
14 watering to one day a week.

15 Q. In that second stage, are there also some  
16 exceptions to the limitations?

17 A. There are. Due to, well, there are businesses  
18 that rely upon outdoor watering for economic  
19 purposes.

20 Q. What would cause that second stage of drought  
21 response measurements to be triggered?

22 A. When the 12 month average of Cheney Reservoir  
23 fell below 70 percent.

24 Q. What was the third stage of drought response  
25 measures?

1 A. The third page includes bans on all outdoor  
2 irrigation, there are some exceptions in stage 2  
3 that remain in place. One thing that I did not  
4 mention is that beginning in stage 2, penalties  
5 for violators would also be put in place. Stage  
6 3 includes also that those penalties would  
7 escalate five fold.

8 Q. So once you are past stage one nothing is  
9 voluntary; is that correct?

10 A. That's right.

11 Q. And what would cause the third stage of response  
12 measures to be triggered?

13 A. When the levels in Cheney fell below 50 percent.

14 Q. What was the final stage of drought response  
15 measures?

16 A. Stage 4 declares a water emergency. It requires  
17 that all outdoor watering is banned, including  
18 those for economic purposes, and then there is a  
19 requirement to cut back 15% on indoor use.

20 Q. Is there any type of customer that would get an  
21 exception from that water stage?

22 A. There are. Hospitals, those that require water  
23 for providing care of individuals and for  
24 emergency purposes.

25 Q. And, Mr. Henry, I think you probably have been

1 following the testimony as we have reviewed in  
2 the past few days, but under the integrated  
3 local water supply plan, since about 1992 or  
4 '93, the City has been drawing the bulk of its  
5 water supply from the Cheney Reservoir as  
6 opposed to groundwater. Is that the reason why  
7 all of these automatic triggers are tied to that  
8 12 months smoothed average at the Cheney  
9 Reservoir?

10 A. Yes, it is, because in order to treat the  
11 drinking water made to standards it requires a  
12 blend of both Equus Beds and Cheney water so  
13 it's critical that we extend the viability of  
14 Cheney as long as possible.

15 Q. And Cheney reservoir, having surface exposure,  
16 it's not just evapotranspiration, there is real  
17 evaporation on the surface of the reservoir, is  
18 that correct?

19 A. Yes.

20 Q. Did the City accept the staff's recommendation  
21 to approve the plan?

22 A. Yes.

23 Q. Are the restrictions in the various stages of  
24 the drought plan intended, when triggered, to  
25 reduce demand on the sources of level at the

1 customer level?

2 A. Yes.

3 Q. What impact is that intended to have on the  
4 viability of Cheney reservoir and the Equus Beds  
5 for water sources during the drought?

6 A. It's intended to extend those resources as long  
7 as possible.

8 MR. McLEOD: Did we admit 16? I think  
9 we did.

10 THE HEARING OFFICER: Yes.

11 BY MR. McLEOD:

12 Q. Turning in the purple binder to the document  
13 that's Pages 2 through 9 behind that drought  
14 response tab.

15 A. (Witness reviews documents).

16 (City Exhibit 17 was marked for  
17 identification by the Reporter.)

18 BY MR. McLEOD:

19 Q. And again, Mr. Henry, for purposes of  
20 housekeeping, the printed material that appears  
21 on numbered page 1, is it part of this document  
22 that's on Pages 2 through 9?

23 A. No, it is not.

24 Q. And, likewise, the printed material that appears  
25 on Page 10 on the reverse of Page 9 is it part

1 of the document 2 through 9?

2 A. No.

3 Q. What is the document marked as an exhibit that  
4 runs from Pages 2 through 9?

5 A. This is a PowerPoint presentation that was  
6 presented to City Council in a workshop for  
7 drought planning.

8 Q. And what's the date of it?

9 A. 26th of February, 2013.

10 Q. So this is a predecessor version of the proposal  
11 and not the final plan that council adopted; is  
12 that correct?

13 A. Correct. This a working document.

14 Q. And basically it's being provided to the City  
15 Council to give them some information to discuss  
16 in a workshop?

17 A. It is to provide them information, and  
18 potentially options, and receive, for staff to  
19 receive further direction from the policy  
20 makers.

21 Q. Looking back at Page 5 within the document, what  
22 was the estimated extension of supply to each  
23 stage of drought response measures as they were  
24 contemplated in the discussion at the time that  
25 this report was prepared?

1 A. For drought stage 1, for the voluntary water  
2 restrictions, it would be .3 months. For stage  
3 2, for the reduction in an outdoor usage, the  
4 extension would be seven months. For stage 3,  
5 which would have banned all outdoor usage at  
6 this point, the extension would have been 21  
7 months. And then for option 4 under the water  
8 emergency, that supply extension would be an  
9 additional five months.

10 Q. After the City Council adopted the final drought  
11 response plan that they did adopt in October,  
12 did the City adjust its MODSIM DSS to simulate a  
13 drought that would take into account the impacts  
14 on Cheney Reservoir of the demand reductions if  
15 this plan were triggered?

16 A. Yes, it is my understanding that the model was  
17 updated to reflect these changes.

18 MR. McLEOD: I will offer this exhibit  
19 for admission.

20 THE HEARING OFFICER: Any objections?  
21 Hearing none, City's Exhibit 17 will be  
22 admitted.

23 BY MR. McLEOD:

24 Q. Mr. Henry, if you will turn in the black binder  
25 and look at table 2-1 in the actual proposal.

1 A. (Witness reviews documents). I am sorry, which  
2 pages?

3 Q. Page 2-1 and table 2-1 that's there.

4 A. Okay.

5 Q. Is that table intended to depict how the planned  
6 reductions and water use increase, as the 12  
7 month average percentage of the Cheney  
8 conservation pool decrease because of the  
9 drought response plan?

10 A. It is.

11 Q. Turning in the purple binder to the May 13th,  
12 2014, document that begins from the tab  
13 strategic planning.

14 A. (Witness reviews documents). Where do I go from  
15 the strategic plan tab?

16 Q. Go back about eight pages (indicating).

17 (City Exhibit 18 was marked for  
18 identification by the Reporter.)

19 A. Are you referring to Page 1 of the water supply  
20 planning document?

21 Q. Yes. Looking at the printed material that is on  
22 the reverse of that page, is that part of the  
23 document?

24 A. No.

25 Q. And, likewise, the printed material that appears

1 on the reverse the Page 4, is that part of the  
2 document?

3 A. No.

4 Q. For purposes of what the document is, on pages  
5 one to four, what is the document, Mr. Henry?

6 A. This was a water supply planning document, a  
7 report that was provided to the city manager  
8 that would have been likely shared with City  
9 Council to inform them and receive further  
10 direction.

11 Q. And as it is stated May 13th, 2014, at this  
12 point the City's drought response plan has been  
13 approved the previous fall; is that right?

14 A. Correct.

15 MR. McLEOD: I will offer the document  
16 for admission.

17 THE HEARING OFFICER: Any objections?  
18 City's Exhibit 18 will be admitted.

19 BY MR. McLEOD:

20 Q. Mr. Henry, in the discussion of design droughts,  
21 on the first page of the document, does the  
22 analysis recognize that Kansas guidelines  
23 require communities to plan for a minimum of 2%  
24 drought that happens roughly every 50 years?

25 A. Yes.

1 Q. Does it also consider the 1% drought similar to  
2 the 1930s dustbowl do occur and have a more  
3 substantial impact on the water supply?

4 A. It does.

5 Q. At the bottom of the page, what does it present  
6 as a potential benefit of planning for a more  
7 severe drought?

8 A. It would reduce the time that customers are  
9 experiencing challenges due to water  
10 restrictions.

11 Q. And primarily when the City has worried in  
12 planning about the restrictions, is our  
13 preference to keep people out of the burden of  
14 those level 3 and 4 restrictions?

15 A. That is correct. It's to avoid those more  
16 severe impacts that would potentially cause  
17 health issues, life safety issues, heavy  
18 economic impact.

19 Q. And which type of drought did the Wichita City  
20 Council select as the design drought for which  
21 city staff should plan?

22 A. That's the 1% exceedance drought.

23 Q. At the time the ASR project was first conceived,  
24 and therefore meaning, ASR Phase I, and demands  
25 existing at that time, how did the City think

1 recharge credits would be used originally?

2 A. Originally the ASR project was conceived for the  
3 credits to be used as part of normal routine  
4 supply.

5 Q. With decreases in demand, and the resulting  
6 revised demand projection, used in the City's  
7 planning, how does the City see the usefulness  
8 of recharged credits now? Or to put the  
9 question as to one of need, when does the City  
10 think the credits would actually be needed as a  
11 source of supply?

12 A. The ASR credits now are critical for drought  
13 protection, and it would be advantageous to save  
14 those as late as possible during the drought.

15 Q. Do you believe that using the 1993 water levels  
16 as the lowest levels of which recharged credits  
17 could be withdrawn, poses a problem for relying  
18 on recharge credits as a supply source during a  
19 long term drought?

20 A. It absolutely does, because as users continue to  
21 pump and draw the aquifer down, modeling has  
22 shown those levels will fall below the '93  
23 levels and the City will have credits that have  
24 been stored that are not available.

25 Q. Has Wichita presented an analysis to DWR and the

1 Equus Beds Groundwater Management District  
2 demonstrating the basis of its concerns for ASR  
3 credit accessibility?

4 A. Yes.

5 MR. McLEOD: We admitted City 18,  
6 didn't we?

7 THE HEARING OFFICER: Yes.

8 BY MR. McLEOD:

9 Q. Please turn to the black binder.

10 A. Okay.

11 MR. STUCKY: Can we go off the record  
12 for just a moment?

13 THE HEARING OFFICER: Yes. Go off the  
14 record.

15 (A short off-the-record discussion  
16 was held at this time.)

17 THE HEARING OFFICER: Back on the  
18 record.

19 MR. McLEOD: I will have the reporter  
20 mark the document as City 19. It is the first  
21 document behind the tab proposal correspondence  
22 in the black binder, document page numbers 1  
23 through 5 behind that tab.

24 THE HEARING OFFICER: What was that  
25 document?

1 MR. McLEOD: City 19.

2 (City Exhibit 19 was marked for  
3 identification by the Reporter.)

4 BY MR. McLEOD:

5 Q. Mr. Henry, the print on reverse of Page 5 is  
6 that part of this document (indicating)?

7 A. No, it is not.

8 Q. As to the other pages of the exhibit, what is  
9 this document?

10 A. This is a letter to David Barfield dated May  
11 24th, 2013. It is signed by Michael G. Jacobs,  
12 Interim Water Resources Engineer for the City of  
13 Wichita.

14 Q. And would you regard it as an official  
15 communication of the City given the authorship  
16 by Mr. Jacobs?

17 A. Yes.

18 MR. McLEOD: I will offer City 19 for  
19 admission.

20 THE HEARING OFFICER: Any objections?  
21 City 19 will be admitted.

22 BY MR. MCLEOD:

23 Q. Mr. Henry, with respect to the point on the  
24 second page of the letter that water levels in  
25 the aquifer could have gone much lower, but for

1 the management changes made by the City to  
2 reduce pumping from the Equus Beds well fields,  
3 what does that have to do with the  
4 appropriateness of the 1993 levels?

5 A. Well, even with the limitations in place,  
6 pumping continues and levels can fall below the  
7 '93 levels.

8 Q. Were those levels simply based on the lowest  
9 recorded water levels at the time the ASR was  
10 permitted?

11 MR. STUCKY: Can I voir dire the  
12 witness just a little bit?

13 THE HEARING OFFICER: Sure.

14 MR. STUCKY: Well, let me ask, did you  
15 do any modeling or analysis to perform, did you  
16 perform any analysis or do any kind of modeling  
17 to determine personally if those water levels  
18 would drop below those 1993 levels?

19 A. No. No, my opinions are based upon water  
20 planning review of other works, developing  
21 strategic plans, so my knowledge has been  
22 provided by others that have done that work.

23 MR. STUCKY: I would ask that those who  
24 have done that work testify as to what those  
25 impacts would be.

1 MR. McLEOD: Modeling will be put on  
2 later. Mr. Henry's management role, and his  
3 understanding of what may happen to water  
4 levels, and the consequence for stranded credits  
5 in a major drought, is really the subject of his  
6 testimony. So I think foundation will be  
7 provided as we go along through the other  
8 witnesses.

9 THE HEARING OFFICER: Any response?

10 MR. STUCKY: Well, we would ask that  
11 the foundation be laid for him to be qualified  
12 to testify on these subjects first before all of  
13 these opinions are entered into the record.

14 THE HEARING OFFICER: I think the  
15 request is reasonable. If Mr. Henry could  
16 please limit to the parameters of the decisions  
17 that he has made or makes, I think that would be  
18 more appropriate.

19 MR. McLEOD: I am assuming that that  
20 line of objections was directed to the document  
21 that was previously admitted without objection  
22 and you are just getting to that a little late?

23 MR. STUCKY: I don't have a problem  
24 with the document itself, but as far as any  
25 opinion as far as what the document means or

1           what the analysis means, unless he has performed  
2           that analysis, I don't want any official  
3           opinions with regard to what those impacts will  
4           be.

5                       MR. McLEOD: Does counsel object to the  
6           general expression by Mr. Henry that the 1993  
7           levels are believed to pose a problem for credit  
8           recovery, or statements that general that are  
9           basis of management strategy a part of the  
10          objection on foundation?

11                      MR. STUCKY: If he is not asked for an  
12          official opinion on whether that will occur. So  
13          if the question is, for example, Mr. Henry, if  
14          we assume that the 1993 levels would drop below  
15          a certain point, would that be something that  
16          would impact the City's planning? I mean, if  
17          it's asked in that way where he is not actually  
18          having to testify to the ultimate conclusion of  
19          what those impacts would be, then we are okay  
20          with that line of questioning.

21                      THE HEARING OFFICER: Mr. Oleen.

22                      MR. OLEEN: I am just weighing in  
23          because I thought we were trying to be more  
24          efficient in, admittedly, taking witnesses down  
25          lines of questioning that might technically be

1 out of order; but to postpone this witness'  
2 testimony to then have some other modeler come  
3 up to appease Mr. Stucky, to then bring this  
4 witness back to answer more questions seems  
5 inefficient in my view. I don't think any  
6 questioning that Mr. McLeod has yet asked of  
7 this witness gets in to the realm of modeling,  
8 technical questions in my opinion.

9 MR. STUCKY: I will clarify. I am not  
10 asking that Mr. McLeod call other witnesses  
11 first. That's not what I am suggesting, that's  
12 not efficient. But I think Mr. McLeod can ask  
13 about perceptions and can ask about conclusions  
14 that will be made by other experts, and ask it  
15 in a fashion that this witness does not have to  
16 make it an official part of his expert  
17 testimony.

18 THE HEARING OFFICER: Mr. McLeod, can  
19 you live within those parameters?

20 MR. McLEOD: I think, but I believe  
21 that with that round of technical lawyerly  
22 discussion we have come to the time.

23 THE HEARING OFFICER: We are now out of  
24 time for the day.

25 MR. McLEOD: Have we had 19 admitted?

1 THE HEARING OFFICER: Yes. 19 was  
2 admitted. And with that, I think we'll recess  
3 for the day. And we'll return at 9:00 a.m.  
4 tomorrow morning. Thank you.

P R O C E E D I N G S

THE HEARING OFFICER: Good morning. We are now back on the record. This is day three of the formal phase of the public hearing where the City of Wichita's ASR Phase II Modification Request. It is December 12, 2019, and I believe we are continuing with the City's presentation of witnesses. So, Mr. McLeod.

MR. McLEOD: Yes. So I think Mr. Henry was on the stand, already under oath, and we were going through City's Exhibit 19.

DAN HENRY

CONTINUATION OF DIRECT EXAMINATION

BY MR. MCLEOD:

Q. Mr. Henry, in the exhibit book that's open before you, do you see the letter that we were looking at, I guess prior to the break yesterday, that had been marked Exhibit 19?

A. I see a letter from Mike Jacobs to Mr. Barfield dated May 24th, 2013.

Q. Right. I think that is the one. And to connect us up to where we were, I think we had established this was a letter that Mike Jacobs

1 had sent for the city, to the chief engineer  
2 complaining about some aspects of the City's  
3 current permit conditions, including the 1993  
4 levels, which we have been discussing and how  
5 those were based simply on the lowest recorded  
6 water levels and how they were connected to the  
7 intended purpose of the ASR I to maintain that  
8 hydraulic barrier to the Burrton chloride plume.  
9 And we should be on the fourth page of the  
10 letter. With respect to the point on the fourth  
11 page of the letter the limiting recovery of  
12 credits below the 1993 levels was originally  
13 tied for the purpose of preventing dissipation  
14 of that hydraulic barrier, which ASR Phase I was  
15 intended to place in the Burrton chloride plume.

16 What does that complaint, that Mike  
17 Jacobs is making there, have to do with the  
18 appropriateness of the 1993 levels for ASR Phase  
19 II facilities?

20 A. Right, well, the primary purpose of the Phase I  
21 infrastructure was to create the hydraulic  
22 barrier. The Phase II portion of the project  
23 was not necessarily addressed to the hydraulic  
24 barrier and the main intent was to supply  
25 additional supply of water.

1 Q. And then what was the next complaint or point  
2 that Mr. Jacobs raised in that letter as to use  
3 of the 1993 levels, even for the ASR Phase I?

4 A. Mr. Jacobs noted, or he stated that it should be  
5 noted, that water levels in the barrier area can  
6 experience significant declines during dry or  
7 drought periods, even without the removal of  
8 recharged credited from ASR Phase I wells.

9 Q. And that would be tied to the 1993 index levels,  
10 they don't prevent anyone else from pumping  
11 their base rates, do they?

12 A. Not to my knowledge.

13 Q. And they don't prevent the City from pumping its  
14 base rights, correct, only credit recovery?

15 A. Correct.

16 Q. With respect to that purpose of the ASR Phase I  
17 as a mechanism to slow the migration of the  
18 Burrton chloride plume, is that the reason why  
19 the City's current proposal is not seeking to  
20 change the existing low index levels for the ASR  
21 Phase I facilities, or to allow recovery of AMCs  
22 from the ASR Phase I wells?

23 A. It is. The benefits of the barrier is to  
24 protect that water quality should remain in  
25 place.

1 Q. As part of the intent of the requested permit  
2 modifications to facilitate utilization of ASR  
3 recharge credits less frequently because the  
4 revised lower index levels would be thought to  
5 allow the City more time to wait until later  
6 years of the drought before it has to draw  
7 credits or lose access?

8 A. Absolutely. We want to avoid taking credits  
9 unnecessarily during temporary dry spells or  
10 shorter periods of drought.

11 Q. Is part of the intent of the requested permit  
12 modifications to enable the City to maintain the  
13 aquifer in a fuller condition because the AMCs  
14 would allow the City to accumulate credits  
15 without having to deplete the aquifer to enable  
16 physical recharge?

17 A. Absolutely.

18 Q. Mr. Henry, to be clear though, both of these  
19 modifications are requested in the City's  
20 proposal, are they conceptually separate to the  
21 extent that the Hearing Officer could approve  
22 one proposed modification and not the other?

23 A. They are.

24 Q. Please turn in the purple binder to the tab  
25 water levels and behind that tab, USGS

1 Scientific Investigations Report, 2016-5165.

2 THE HEARING OFFICER: I am sorry where  
3 is the document?

4 MR. McLEOD: Purple binder behind the  
5 tab water levels. I think it may actually, I  
6 could have just said the back of the purple  
7 binder. I think it's the only document there.

8 (City Exhibit 20 was marked for  
9 identification by the Reporter.)

10 MR. McLEOD: I will offer it for  
11 admission of a government document.

12 THE HEARING OFFICER: Any objection?  
13 Hearing none, City 20 will be admitted.

14 BY MR. McLEOD:

15 Q. Mr. Henry, turning back to the table of Page 9  
16 of that report.

17 A. Okay.

18 Q. Does the bottom line of the data for the central  
19 well field area show that as of January 2016,  
20 the water levels there were only 41,000 acre  
21 feet below predevelopment levels?

22 A. It does.

23 Q. What's the impact of those high water levels  
24 upon the City's ability to inject physical  
25 recharge in the aquifer?

1 A. The 41,000 clearly shows that there had been  
2 significant recovery since depletion from  
3 predevelopment, and at that those levels  
4 injection of water from the ASR system becomes  
5 difficult without drawing the levels down, of  
6 course.

7 Q. Mr. Henry, if you will look in the exhibit books  
8 that have been placed on the witness table by  
9 the District, and find Groundwater District tab  
10 49.

11 A. (Witness reviews document).

12 (GMD Exhibit 49 was marked for  
13 identification by the Reporter.)

14 MR. McLEOD: I offer this document for  
15 admission.

16 THE HEARING OFFICER: Any objections?

17 MR. STUCKY: Just so we are clear for  
18 the record, can we admit this as a District 49  
19 so we have it clear?

20 THE HEARING OFFICER: I believe that's  
21 what he did.

22 MR. McLEOD: It is so marked by the  
23 reporter.

24 THE HEARING OFFICER: GMD 49 will be  
25 admitted.

1 BY MR. McLEOD:

2 Q. Mr. Henry, please turn to Page 15 of that  
3 report.

4 A. Okay.

5 Q. What does it show to be the calculation of  
6 predevelopment storage in the Wichita well field  
7 area?

8 A. The central part of the study area states  
9 1,025,000 acre feet.

10 Q. Please turn to section 3.4 of the proposal,  
11 which is in the black binder, 3-6 of the  
12 proposal, and that document has been admitted as  
13 Exhibit 1. Now, City's Exhibit 1.

14 A. Okay.

15 Q. And, Mr. Henry, you were here for the discussion  
16 yesterday of things that were and weren't  
17 proposed permit conditions. The section 3.4 of  
18 the proposal reflects the proposed permit  
19 conditions of the City's --

20 A. Hang on, I am not on the right page.

21 Q. Find section 3.4.

22 A. (Witness reviews documents). I see figure 13.

23 MR. McLEOD: May I approach the  
24 witness?

25 THE HEARING OFFICER: Yes.

1 A. Thank you.

2 Q. Mr. Henry, in that section 3.4 of the proposal,  
3 does it reflect some proposed permit conditions  
4 for the City's request for aquifer maintenance  
5 credits?

6 A. It does.

7 Q. Would condition Number 3, of the proposed AMC  
8 proposed conditions, limit ASR Phase I in  
9 recovery wells to recovery of physical recharge  
10 only?

11 A. It does.

12 Q. Does proposed condition Number 1 provide that  
13 the physical recharge activities will continue  
14 to occur during periods when aquifer conditions  
15 facilitate adequate physical recharge capacity  
16 combined by an annual ASR, excuse me, ASR  
17 operations plan?

18 A. It does.

19 Q. And is the 120,000 acre foot cap on total  
20 accumulation of recharge credits and AMCs is  
21 that addressed in condition Number 4?

22 A. Yes.

23 Q. And to clarify a question that came up, and I am  
24 not sure ever got answered during Mr. Pajor's  
25 testimony, what does that condition there tell

1           us about the basis of that 120,000 acre foot  
2           cap, what it was derived from?

3       A.    That was derived from the conceptual development  
4           of ASR program that was an estimate at the time  
5           of the central well field basin storage area,  
6           based on the '93 levels.

7       Q.    And it also reflects that that proposed 120,000  
8           acre foot limit represents an estimated 11.7  
9           percent of the total aquifer storage there?

10      A.    Correct.

11      Q.    So really we are talking there about deriving  
12           this proposed cap based on capacity and  
13           essentially the top layer of the aquifer; is  
14           that correct?

15      A.    Yes.

16      Q.    Does proposed permit condition Number 2 limit  
17           the accrual of all recharged credits to the rate  
18           and quantity authorized by the ASR Phase II  
19           surface water right?

20      A.    Absolutely.

21      Q.    In the black binder, please turn to the proposal  
22           correspondence tab.

23      A.    (Witness complies).

24      Q.    And behind it back to number pages 121 to 127.

25      A.    Okay.

1 MR. McLEOD: Before I offer this let me  
2 check, I think somebody may have already put  
3 that in. I think this is already in but other  
4 than spending the time to look for the exhibits,  
5 let's look.

6 (City Exhibit 21 was marked for  
7 identification by the Reporter.)

8 Q. In the back binder behind tab correspondence  
9 numbered 121 to 127 I had the document marked as  
10 City's 21. Mr. Henry, what is the document?

11 A. This is a letter of Alan King with public works  
12 and utilities to David Barfield dated May 22nd,  
13 2018.

14 Q. Were you here during the testimony of Mr. Pajor  
15 when a copy of this was introduced as another  
16 party's exhibit, and Mr. Pajor confirmed that it  
17 was an official statement on the part of the  
18 City?

19 A. I was here.

20 Q. If you would look at numbered Page 126 in that  
21 document, and particularly paragraph 14 on that  
22 page.

23 A. Okay.

24 Q. Does it express that the City agrees with the  
25 operating principle that native water rights

1 should be utilized prior to recharge credits?

2 A. It does.

3 Q. And just as a clean up, Mr. Henry, the printed  
4 material that appears on the reverse of page  
5 127, is it part of this document?

6 A. No, it doesn't appear to be the letter ends on  
7 page 127.

8 MR. McLEOD: Thank you. I offer it for  
9 admission.

10 THE HEARING OFFICER: Any objection?

11 MR. STUCKY: No objection.

12 THE HEARING OFFICER: City 21 will be  
13 admitted.

14 BY MR. McLEOD:

15 Q. Under the City's proposal, Mr. Henry, would the  
16 availability of water in the Little Arkansas  
17 River the diversion remain identical to the base  
18 flow and seasonal limits developed as part of  
19 the ASR Phase I and Phase II permitted process?

20 A. Yes, there are no proposed changes in that  
21 regard.

22 Q. Is the intention of the proposal that use of  
23 this water directly replaces diversions that  
24 would otherwise be required from the Equus Beds  
25 well field resulting in an equal amount of

1 groundwater effectively left in storage for the  
2 benefit of all aquifer users?

3 A. Absolutely.

4 MR. McLEOD: I don't have further  
5 questions for the witness.

6 THE HEARING OFFICER: Mr. Oleen.

7 MR. OLEEN: No questions by DWR.

8 THE HEARING OFFICER: Mr. Stucky.

9 MR. STUCKY: Thank you. May I have a  
10 moment to locate the exhibits?

11 THE HEARING OFFICER: Yes. Do we need  
12 to go off the record?

13 MR. STUCKY: Yes.

14 THE HEARING OFFICER: Off the record.

15 (A short off-the-record discussion  
16 was held at this time.)

17 THE HEARING OFFICER: Back on the  
18 record.

19

20 CROSS EXAMINATION

21 BY MR. STUCKY:

22 Q. Mr. Henry, yesterday you indicated that you have  
23 a Bachelor of Science in what was the official  
24 degree you said you had?

25 A. Biology.

1 Q. Biology. But as far as any experience in  
2 modeling or hydro geology or geology, you don't  
3 have any education or experience in that; is  
4 that correct?

5 A. I have no experience in modeling, I have some  
6 course work in geology; but your point is  
7 correct.

8 Q. Okay. Now, yesterday you talked about Exhibit  
9 16, which I believe was a letter regarding the  
10 City Council meeting.

11 A. If you could point me to that document, I would  
12 confirm that.

13 Q. It is in the purple notebook Pages 60 and 61 in  
14 the purple notebook under the tab drought  
15 response.

16 A. (Witness reviews documents.) Okay.

17 Q. Now, with respect to that document you mentioned  
18 that there were several stages; and, in fact,  
19 there are four stages here identified to try and  
20 reduce water consumption in the City; is that  
21 correct?

22 A. Correct.

23 Q. And the first was a rebate program and then it  
24 scales all the way down to at some point cutting  
25 off most uses of water; is that correct?

1 A. Generally.

2 Q. Now, did you help to develop this particular  
3 plan?

4 A. I participated in planning meetings.

5 Q. In other words, were the ideas in this plan were  
6 they your ideas or were you basically just being  
7 consulted with regard to the ideas in this plan?

8 A. They were developed as part of the team.

9 Q. It's indicated in here that certain activities  
10 would be exempt; is that correct?

11 A. Yes, in some cases.

12 Q. How is that decided?

13 A. That was decided through a process of  
14 development by the project team and interaction  
15 between the project team and City Council  
16 members in workshop settings.

17 Q. Would it be economical, or feasible, to make the  
18 requirements to limit water use more stringent?  
19 Could you make those requirements more stringent  
20 in nature?

21 A. I couldn't.

22 Q. Could the City Council?

23 A. The City Council they direct policy, they could  
24 if they wanted to.

25 Q. So, in other words, if they chose to make this,

1           these requirements more stringent, would you at  
2           least agree with me that that would further  
3           limit water use in the city?

4       A.    That's the concept, yes.

5       Q.    I ask that you flip now to Exhibit 17 in your  
6           notebook.  And it was, I think the first, one of  
7           the first documents following the orange tab,  
8           drought response plan in that purple notebook.

9       A.    (Witness reviews documents).  The PowerPoint?

10      Q.    That's correct.  Drought planning initiative.

11      A.    Yes.

12      Q.    I want you to flip with me a few pages in to  
13           this document and on Page 6 I ask that you walk  
14           with me to Page 6.

15      A.    Okay.

16      Q.    So on Page 6 in this document there are several  
17           different options, as I understand it, to  
18           increase water for the city; is that right?

19      A.    To increase water for the city?  No.

20      Q.    To come up with additional sources of water for  
21           the City, is that what these options are  
22           designed to accomplish?

23      A.    Yes.

24      Q.    So with respect to Option 1, it says:  Restore  
25           well field capacity.  And the description is

1 restore well capacity extends the use of Cheney  
2 but shortens the life of the aquifer. So, in  
3 other words, tell me first of all what is meant  
4 by restored well capacity as it relates to  
5 Option 1?

6 A. I don't recall.

7 Q. You don't know which wells it's referring to?

8 A. No, I would imagine it would be the city's wells  
9 and Equus Beds well field. It could mean the  
10 local well field. I don't know for sure what  
11 that means.

12 Q. It says that restoring this well capacity,  
13 whatever that would constitute, would you agree  
14 with me that it's indicated here at least that  
15 that would account for 15,000 acre feet of  
16 water?

17 A. Yes.

18 Q. But if we are to restore what we believe to be  
19 wells in the Equus Beds well field, and whether  
20 it's improved them, or we are not really sure  
21 what that means, but if we were to do that there  
22 is a detriment that's identified in this Option  
23 1 as well; is that correct?

24 A. What do you mean by detriment?

25 Q. Well, can you read to me again the first

1 sentence of that description.

2 A. Restore well capacity, extends the use of  
3 Cheney, but shortens the life of the aquifer.

4 Q. So, in other words, if these wells are restored,  
5 and additional water is taken out of the  
6 aquifer, it was the City's view that the  
7 detriment would be that it would shorten the  
8 life of the aquifer; is that correct?

9 A. Relative to the City's rights, yes.

10 Q. Now, there is an Option 2 that's also identified  
11 here. It says that water rights essentially  
12 could be purchased from other users, and I  
13 assume within the Equus Beds aquifer, is that  
14 what Option 2 constitutes? Or do you know?

15 A. I don't know. You know, it takes two parties to  
16 come to that kind of an agreement, and those  
17 negotiations never happened. So I don't have an  
18 opinion or can't comment on that.

19 Q. I guess my question is, it indicates a specific  
20 number of acre feet that somebody, as they were  
21 putting together this plan, believed could be  
22 accumulated and the number was 7,500 acre feet.  
23 I guess my question is, to come up with a number  
24 like that, it would have suggested to me that  
25 there was at least initial conversations with

1           somebody. But as I hear you today you don't  
2           know what the nature of any of those discussions  
3           were; is that correct?

4    A.    I don't know if I could agree with the word  
5           initial conversations. I think somebody had a  
6           concept and identified a possibility of 7,500  
7           acre feet.

8    Q.    Is that 7,500 acre feet just an arbitrary  
9           number?

10   A.    I have no idea.

11   Q.    Let's move on to Option Number 3. It says in  
12           Option Number 3 the description says, additional  
13           wells would be installed in west Wichita to tap  
14           and shallow groundwater that is not currently  
15           being used in the system and that would generate  
16           five to 10,000 acre feet. Tell me about the  
17           drilling of these shallow wells in west Wichita.  
18           What is the concept there?

19   A.    I don't recall whether these are existing rights  
20           that the City already has or whether it would be  
21           under rights that we would have to acquire.  
22           These were some potential strategies that were  
23           developed as part of a plan phase that never  
24           went forward. We have moved on since then. So  
25           I don't recall.

1 Q. Okay. And I hate to do this to you, but I am  
2 going to circle back to Option 1 just for a  
3 moment. That 15,000 acre feet that they  
4 identified in Option 1 is that to be new water?  
5 Is that new water to be accumulated? Do you  
6 know the answer to that?

7 A. It would not be new water in the context of the  
8 City's water rights.

9 Q. So that 15,000 acre feet isn't contemplating new  
10 permits?

11 A. I don't know whether it is or is not.

12 Q. As you are sitting here today you are not sure  
13 where that 15,000 acre feet would come from?

14 A. Correct.

15 Q. Let's move to Option Number 4 in this particular  
16 document. I will read the description, the  
17 first sentence of that description for you. It  
18 says: Groundwater not presently available for  
19 use could be desalinated and pumped in to the  
20 system. Do you see that sentence?

21 A. I do.

22 Q. And there is a cost that is estimated to  
23 accomplish that purpose. Do you see what that  
24 cost is?

25 A. Yes. I do.

1 Q. Could you read for me what that cost is?

2 A. It says \$200 million dollars.

3 Q. Tell me a little bit about that idea, how would  
4 that work that you could take salt out of water  
5 and where would that be accomplished?

6 A. It wasn't my idea, so I don't know.

7 Q. Do you have any knowledge or expertise about  
8 whether or not that plan was designed to take  
9 some of the salt out of the Burrton plume, for  
10 example?

11 A. It could have been.

12 Q. But as you are sitting here today can you answer  
13 affirmatively as far as what the nature of that  
14 plan was?

15 A. I think it was relative to the Burrton chloride  
16 plume, but I can't say with hundred percent  
17 certainty.

18 Q. Just so I am understanding, if that is true,  
19 that for \$200 million, water could be diverted  
20 from the Burrton plume, the City of Wichita  
21 could take the salt out and could have a supply,  
22 is that what this concept is?

23 A. I don't know. I don't know what all the \$200  
24 million covered, if that covered the full cost,  
25 if there were other partners. I don't know.

1 Q. Were you involved in this drought planning  
2 initiative, this February 26th, 2013,  
3 initiative?

4 A. This is a PowerPoint presentation that  
5 represents planning that took place by a large  
6 team over a period of time.

7 Q. Were you involved in helping to plan or to come  
8 up with this plan?

9 A. I was in some of those planning meetings, I was  
10 in some of the meetings to review the work, the  
11 work was done by others, it was not done by me.

12 Q. Just a moment ago you indicated that currently  
13 the City is only able to either pump water from  
14 Cheney Reservoir on one hand or water from the  
15 Equus Beds well field, but can't get hundred  
16 percent of its water from either location. Is  
17 that what your testimony was?

18 A. It was that there are treatment challenges that  
19 we can't treat hundred percent Equus water and  
20 meet our requirements.

21 Q. And at this point can you treat hundred percent  
22 Cheney water and meet your requirements?

23 A. I am not certain if we could treat hundred  
24 percent, but we could treat, well, I am  
25 comfortable in saying 80% maybe, 90%.

1 Q. Would you agree with me that plans are in place  
2 with the City to come up with the infrastructure  
3 to be able to treat and get hundred percent of  
4 its water supply either from the Equus Beds or  
5 from Cheney Reservoir?

6 A. Absolutely.

7 Q. Do you have any idea when that plan is going to  
8 be in place?

9 A. It should be in place by fourth quarter of 2024,  
10 I believe.

11 Q. Do you have any knowledge as far as why we are  
12 looking at approximately another five years  
13 before that would be in place?

14 A. That's how long it will take the City to  
15 complete design and do construction of a new  
16 water treatment plant.

17 Q. Where will that treatment plant be constructed?

18 A. It will be constructed on land the City owns  
19 within the city limits of Wichita near 21st  
20 Street and Zoo Boulevard.

21 Q. When this water plant is constructed with its  
22 ability to treat water, if you are able to treat  
23 water in this plant that allow the City to have  
24 hundred percent of its water supply from either  
25 Cheney Reservoir or the Equus Beds aquifer, does

1           it also follow that the City could treat water  
2           from other sources at this plant?

3       A.    The only other source, well, there is the Equus  
4           Beds well field, there is Cheney Reservoir,  
5           there is water that's diverted from the Little  
6           Arkansas River and treated at the ASR surface  
7           water treatment plant and then the City has some  
8           rights in a local well field in the City of  
9           Wichita. Those are the sources that are being  
10          contemplated under the current design. No other  
11          sources are being designed for.

12       Q.    I understand that. But let's say hypothetically  
13           speaking the suddenly the City of El Dorado  
14           calls you up, the phone rings you answer, it's  
15           Don Henry on the phone and the City of El Dorado  
16           says we want to sell you 40,000 acre feet of  
17           water a year, and all you have to do is find a  
18           way to treat it.

19                            Under this hypothetical, would this  
20           treatment plant built in 2024 would it have the  
21           capability of treating water, from another  
22           source, say El Dorado?

23       A.    I think it's reasonable to assume so.

24       Q.    I ask that you flip now to Exhibit 18. The  
25           City's Exhibit 18, and it's a document entitled,

1 Water Supply Planning. It's right after the  
2 strategic plan in the purple notebook. I am  
3 sorry, it's a green tab. We had to put new tab  
4 of colors on here. That confused me.

5 A. I have strategic plan and right behind that is  
6 program manager notes.

7 Q. If you flip in just a few pages there was a  
8 document that says water Supply Planning at the  
9 very top.

10 A. Behind which tab? I am sorry.

11 Q. Behind the green tab that's called Strategic  
12 Plan.

13 A. Okay.

14 Q. And it looks to be about five pages in there is  
15 a document called Water Supply Planning.

16 A. Okay.

17 Q. Are you on that document?

18 A. Yes.

19 Q. You were asked I believe yesterday several  
20 questions about some of the specifics in this  
21 document; is that correct?

22 A. I believe I was asked about the 2% drought and  
23 the 1% drought under the design drought section,  
24 I believe is what it was.

25 Q. Let's talk about that design drought section.

1 In the second paragraph under the design drought  
2 section could you read for me the very first  
3 sentence of that second paragraph.

4 A. Sure. Guidelines, from the State of Kansas  
5 require communities to plan for a minimum of a  
6 2% drought, which occurs roughly every 50 years.

7 Q. I will stop you there. So, in other words,  
8 current laws and current requirements only  
9 require a city to plan for a minimum of a 2%  
10 drought, is that what this says?

11 A. What it means to me is that is a minimum level  
12 of responsibility that any utility should plan  
13 for.

14 Q. So the answer to my question is yes?

15 A. Okay.

16 Q. The very next sentence though, actually the  
17 third sentence says: That 1% droughts are what,  
18 are the next level that a city could plan for.  
19 Is that correct, basically what the end of that  
20 paragraph is saying?

21 A. Yes. It also says they do occur and have a  
22 substantial impact on the water supply.

23 Q. In the very next paragraph it's indicated that  
24 during a 1% drought within the City it would  
25 require 71 months of outdoor watering bans. Do

1           you see that language?

2       A.    I do.

3       Q.    Do you know how that 71 months was determined,  
4           as you are sitting here today, do you have any  
5           knowledge as far as how that amount of months  
6           was calculated?

7       A.    I do not.

8       Q.    And in the very next sentence it says, within a  
9           2% drought it would require 11 months of  
10          watering bans. Do you see where I am reading in  
11          that document as well?

12      A.    I do.

13      Q.    And do you have any knowledge about how 11  
14          months was calculated?

15      A.    I don't.

16      Q.    I would ask that, well, let me back up. It says  
17          in this document under highest citizens'  
18          priority that within the City of Wichita  
19          citizens were willing to pay more for a viable  
20          water supply, is that what that says? I am  
21          asking that you look right under highest citizen  
22          priority the second sentence it says: The  
23          public is willing to pay for water reliability,  
24          do you see where I just read?

25      A.    Yes.

1 Q. So, in other words, when the citizens of Wichita  
2 were prioritizing what they were willing to pay  
3 money for, they were willing to pay for a viable  
4 water supply; is that correct?

5 A. According to this survey, yes.

6 Q. Did that survey specify the extent to which the  
7 citizens of Wichita would be willing to have  
8 their rates increased to have a viable water  
9 source?

10 A. I don't know if it did or it did not. I can't  
11 imagine that it did.

12 Q. But, in other words, pursuant to this study,  
13 what was clear was that the citizens in the City  
14 of Wichita were willing to pay good money to  
15 ensure that they had a viable water source, is  
16 that true?

17 A. Absolutely. Water supply is a top priority for  
18 citizens and they are willing to pay for that.

19 Q. When were the water rates last increased in  
20 Wichita?

21 A. City Council adopted the new rate ordinance in  
22 December of this year. They go in effect  
23 January 1.

24 Q. What will the increase be?

25 A. Roughly 5% for combined water and sewer.

1 Q. Prior to that, when was the last rate increase?

2 A. It would have been a year prior.

3 Q. And what percent was the year prior?

4 A. I don't recall.

5 Q. When you increase rates by 5% do the citizens  
6 generally complain? Or what does that look like  
7 when the rates are increased?

8 A. Sure, I mean, it's a mixed response. There are  
9 some citizens who are informed and they  
10 understand and willing to pay those increases.  
11 And there are others, that for different  
12 reasons, affordability, whatever reasons, they  
13 would oppose that and have, yes.

14 Q. So I am clear, that if there was an initiative  
15 that the City wanted to pay for to secure a  
16 viable water source, the City could choose to  
17 further increase rates to help pay for it, is  
18 that a true statement?

19 A. Well, sure. The City Council, the electives,  
20 have that ability.

21 Q. On the next page of this document, in that  
22 second full paragraph it refers to a rebate  
23 program that was implemented in the City.

24 A. I am sorry, what page are you on?

25 Q. It's Page 2 of that document, second full

1 paragraph. It talks about a rebate program.

2 A. Okay. I see that.

3 Q. First of all, tell me how does that rebate  
4 program work?

5 A. There are certain appliances, dishwashers,  
6 clothes washers, other things like shower heads,  
7 low flush toilets, those types of things that  
8 are certified as being water efficient. That if  
9 a citizen purchases one of those items then the  
10 City offers a certain amount of rebate back on  
11 that with a receipt.

12 Q. And in that first sentence of that second full  
13 paragraph, it says that the rebate program in  
14 2013 at least reduced usage by 0.44 percent. Do  
15 you see where I just read?

16 A. Yes.

17 Q. So it decreased usage by less than half a  
18 percent, is that true?

19 A. That's true.

20 Q. Do you know why the response with regard to  
21 reduced usage was so poor with regard to that  
22 rebate system?

23 A. I don't know that that is poor. The city has an  
24 ongoing conservation target every year of .35  
25 percent and this exceeds that, so I would say it

1 performed well.

2 Q. How does the City of Wichita water rates compare  
3 to those of other cities, for example, Newton?

4 A. I have no idea what Newton's water rates are.

5 Q. To other cities, in general, do you have any  
6 knowledge?

7 A. Yes. Compared to the 50 largest cities the City  
8 of Wichita has rates that are in the top ten for  
9 low rates.

10 Q. What about compared to other, say Hutchinson,  
11 another larger, or Salina, another larger city  
12 in Kansas? Do you know how your rates would  
13 compare to those cities?

14 A. No, I don't know.

15 Q. At the bottom of that page it refers to a 2014  
16 water conservation program. And there are  
17 several initiatives that are identified. It  
18 says a modified rebate program, study landscape  
19 incentives, and at the very bottom it says study  
20 industrial reuse. What is meant by industrial  
21 reuse?

22 A. I believe what is meant by industrial reuse here  
23 would be to use reclaimed water from the City's  
24 wastewater treatment plant and reuse it for  
25 industrial purposes.

1 Q. And in the same document it says that the  
2 affects of that would be determined during the  
3 studies, is that a true statement?

4 A. Yes.

5 Q. Do you know if those studies have occurred?

6 A. I know some work has been done.

7 Q. Do you know at what point the City will know if  
8 it's able to get some of its water usage from  
9 reclaiming this industrial water?

10 A. I know that it's already occurred.

11 Q. And as I understand it, the study is designed to  
12 help determine if more water can be reclaimed,  
13 is that what this study is about?

14 A. I am not sure.

15 Q. Let's look to the next page, Page 3 of that  
16 document.

17 A. Okay.

18 Q. Yesterday I asked Mr. Pajor about the nine  
19 potential options that the City was considering  
20 to increase its water supply. And I asked Mr.  
21 Pajor to name some of those. In addition to  
22 what Mr. Pajor named, do you have any other  
23 indication of what those nine options were?

24 A. I don't recall exactly what Mr. Pajor named and  
25 I can't list nine of them, but in general there

1           were different options for ASR improvements, it  
2           included potential reuse, I believe. And a  
3           couple of options for El Dorado water.

4       Q.    Tell me about the bank storage wells that would  
5           pull river water downstream from the wastewater  
6           plant and treat it to drinking water standards,  
7           tell me about that option.

8       A.    That was a concept that was discussed in terms  
9           of reuse water. And the concept would have been  
10          to reclaim water that was discharged from the  
11          water treatment plant through bank storage  
12          wells.

13      Q.    So to reclaim that water, and increase the  
14          capacity to reclaim that water, would it be a  
15          true statement that the city would have to build  
16          additional bank storage wells?

17      A.    Yes.

18      Q.    Have those additional bank storage wells been  
19          constructed?

20      A.    No. This was just a concept, it hasn't gone any  
21          further than that.

22      Q.    Do you have any knowledge, as you are sitting  
23          here today, as far as why that particular  
24          concept hasn't gone any further?

25      A.    It was expensive and the concept of reuse, there

1           wasn't any appetite for it at the time.

2       Q.    How much is expensive?

3       A.    I don't recall.

4       Q.    With respect to the El Dorado reservoir, we did  
5           hear testimony yesterday that one of the  
6           concerns with El Dorado reservoir is the extent  
7           to which the City of Wichita may be at the mercy  
8           of the City of El Dorado. Was that one of the  
9           concerns that was identified?

10      A.    Right.

11      Q.    Has the City discussed with, the City of  
12           Wichita, discussed with the City of El Dorado  
13           the possibility for a long term contractual  
14           arrangements to achieve getting water from  
15           El Dorado reservoir?

16      A.    Do you want to expound on that for me?

17      Q.    Well, has someone from the City of Wichita  
18           contacted the City of El Dorado, for example,  
19           and said, could we enter in to a 30 year  
20           contract where you promise for us to be able to  
21           receive your water during that period?

22      A.    I don't know. I don't know whether, who  
23           contacted whom, but I do know there were  
24           discussions between the City of Wichita and the  
25           City of El Dorado on the possibility of the City

1           utilizing El Dorado water for drought supply.

2       Q.    And I guess my question is -- well, strike that.

3                        Let me back up.  Would you at least  
4           agree with me that from a conceptual standpoint  
5           it would be possible for the City of Wichita to  
6           enter in to a long term contractual arrangement  
7           to secure water from the City of El Dorado?  Is  
8           that a possibility?

9       A.    In what context?

10      Q.    If the two parties were to agree on this long  
11           term contractual arrangement, could that be a  
12           possibility if both sides agreed?

13      A.    I don't know whether it would be possible or  
14           not.  If you are asking whether it would be  
15           legal, that's not for me to answer.  It may or  
16           may not be possible for economic reasons or for  
17           water availability or all kinds of variables.  I  
18           don't know.

19      Q.    As you were sitting here today, you weren't  
20           involved in any discussions with the City of  
21           El Dorado to see if there could be a viable  
22           source achieved for 30, 40, 50 years, you  
23           weren't involved in those discussions?

24      A.    Personally I didn't have any discussions with El  
25           Dorado.

1 Q. So you don't have any personal knowledge as far  
2 as whether that barrier to achieving a long term  
3 supply from El Dorado could have been overcome,  
4 is that a true statement?

5 A. The only knowledge I have of talking to El  
6 Dorado for water supply would have been for  
7 drought supply, and that's a non starter because  
8 the supply that El Dorado has, they have plenty  
9 of water supply during non drought years, but  
10 the City does also. We spill water out of  
11 Cheney just like El Dorado does. But when you  
12 get in to a prolonged 1% drought the water in  
13 the El Dorado reservoir is not there for the  
14 City's use.

15 Q. And who did those discussions occur with?

16 A. You know, I am not going to name names, I am not  
17 sure who those parties were, they were under the  
18 direction of the city manager and the department  
19 head.

20 Q. Have you looked at any studies or any kind of  
21 analysis personally that verified what you just  
22 said? Or is that just high level discussions?

23 A. High level discussions. I know, yes, I have  
24 seen reports, but I can't recall what they were  
25 or who they were authored by, but I am

1 reasonably informed it that capacity.

2 Q. Have you brought any of those reports to this  
3 hearing? Or have any of those reports been  
4 produced as far as an exhibit, to your  
5 knowledge?

6 A. Not that I am aware of.

7 Q. I am going to ask that you flip in your exhibit  
8 notebook to Exhibit 19.

9 A. Where is that?

10 Q. It is in the black notebook, it is in, it's  
11 after proposal correspondence, it looks like a  
12 pinkish tab, the very first document.

13 A. I am there.

14 Q. Are you on that document now?

15 A. Yes, sir.

16 Q. You testified that this was an official document  
17 that I think Mr. Jacobs sent to the Division of  
18 Water Resources; is that correct?

19 A. Correct.

20 Q. Would you agree that this document, at least at  
21 the time, represented an official opinion of the  
22 City?

23 A. Yes.

24 Q. Now, this letter was sent to the Division of  
25 Water Resources; is that correct?

1 A. Yes.

2 Q. Why wasn't this letter also carbon copied to the  
3 Groundwater Management District? Or do you  
4 know?

5 A. I don't know.

6 Q. Just by looking at the face of this document  
7 though, does it give you any indication that  
8 this correspondence was also sent to the  
9 Groundwater Management District at the same  
10 time?

11 A. At a glance I don't see that there is any  
12 indication that it was.

13 Q. All right. In the very first paragraph of that  
14 document, it refers to, in that first sentence  
15 it refers to the City's goal to construct  
16 additional bank storage wells in the future. Is  
17 that an accurate characterization of part of  
18 that sentence?

19 A. It says create appropriate regulations for bank  
20 storage wells and the City's Aquifer Storage and  
21 Recovery Project.

22 Q. Do you have any knowledge, as you are sitting  
23 here today, whether or not the City of Wichita  
24 intends to construct additional bank storage  
25 wells in the future?

1 A. That would be speculation whether we will or  
2 will not. I know that it's possible.

3 Q. Is it in your plan?

4 A. Which plan?

5 Q. In the City's strategic plan to secure a water  
6 source. Does the City have the intention of  
7 constructing additional bank storage wells in  
8 the future?

9 A. It's possible. Some of that depends upon the  
10 outcomes of the permit modifications. And that  
11 has been communicated to Groundwater Management  
12 District early on when we were discussing the  
13 proposal with them that we needed to know sooner  
14 rather than later what their opinions were or  
15 what they would suggest in terms of reasonable  
16 terms and conditions, because the City was  
17 planning what we would need to do in terms of  
18 the drought.

19 Q. So to characterize your testimony, if some of  
20 the conditions that the city thought necessary  
21 fell in to place then the City would desire to  
22 build additional bank storage wells?

23 A. Well, I think with the current terms and  
24 conditions that we have now, and being compelled  
25 to pump the aquifer down in order to make room

1 for injection, that additional capacity in terms  
2 of storing credits faster would be desirable.

3 Q. Now, just a moment ago you indicated to me that  
4 this, this letter was an official communication  
5 from the City and as the result you believed it  
6 was the official position of the City at the  
7 time; is that correct?

8 A. I believe so.

9 Q. I ask that you flip to Page 2 of this letter.

10 A. (Witness complies).

11 Q. Could you read the first sentence. I think it's  
12 the second full paragraph. It's a little  
13 unclear how this letter is written, but the  
14 first sentence where it starts with during.

15 A. Sure. During the discussion and approval  
16 process for the Phase I ASR applications, the  
17 DWR staff and the City agreed that using the  
18 1993 levels as the bottom of the basin storage  
19 area was a reasonable and conservative number at  
20 the time.

21 Q. So at least the author of this letter, Mr.  
22 Jacobs, indicated that the original minimum  
23 index level, which is the minimum index level  
24 the City has in place right now, was reasonable,  
25 is that a true statement?

1 A. Yes.

2 Q. Now, on Page 3 of that letter it indicates that  
3 some water was restored to the Equus Beds  
4 aquifer by the City reducing its pumping. Do  
5 you have any idea, as you are sitting here  
6 today, how that number was derived or  
7 calculated?

8 A. I am not familiar with the calculation, no.

9 Q. So if you were to try and testify as to how that  
10 number was determined it would be purely your  
11 speculation?

12 A. On how it was calculated? Yes.

13 Q. At the bottom of that letter it indicates some  
14 conclusions from ASR Phase I and II. Conclusion  
15 Number 13 that's identified at the bottom of  
16 that page.

17 A. I am sorry, what page are you on?

18 Q. I am on Page 3.

19 A. Okay.

20 Q. Page 3 at the bottom it says ASR Phase I,  
21 conclusion Number 13. Do you see where I am  
22 reading?

23 A. Yes, sir.

24 Q. And if I were to highly summarize that  
25 conclusion, does that conclusion indicate that

1 keeping the minimum index level at the level  
2 that was determined, was in the public interest  
3 at that time?

4 A. Yes.

5 Q. And additionally, it indicates in, well, could  
6 you read the very next ASR Phase I order, Number  
7 8, could you read that one for me?

8 A. The water shall only be injected into the basin  
9 storage area by means of injection wells when  
10 the water level at any required monitoring well  
11 located within 660 feet of an injection well is  
12 10 feet or more below the land surface elevation  
13 at those observation wells. Do you want me to  
14 continue?

15 Q. Yes, please.

16 A. Recharge credits may be withdrawn from a cell  
17 only when recharge credits are available from  
18 the cell and the static water level at its index  
19 well is above the lowest index level. Do you  
20 want me to continue?

21 Q. So just a question, general question, is the  
22 recharge capacities of the City is it partially  
23 dependent upon the level of a given index cell,  
24 water level in a given index cell?

25 A. What do you mean by capacity?

1 Q. Well, is the capacity of the City to physically  
2 recharge the aquifer, somewhat dependent upon  
3 the water level of an individual index cell?

4 A. Yes. The rate at which it can be injected and  
5 the amount it can be injected is affected by the  
6 water level, sure.

7 Q. Flip with me now to Page 4 of that document.

8 A. (Witness complies). Okay.

9 Q. I think you should be on that page already.

10 A. Yes.

11 Q. In that second full paragraph in the second  
12 sentence it indicates, toward the end of that,  
13 that recharge credits during periods when water  
14 levels are below those that existed in 1993  
15 would not serve the public interest because it  
16 would deteriorate any established hydraulic  
17 barrier created from recharge injection. Would  
18 you agree that that was an accurate  
19 characterization of what's written in this  
20 letter?

21 A. Yes.

22 Q. So, in other words, what was indicated in this  
23 particular part of that sentence was that if  
24 water was taken below those 1993 levels, and I  
25 will break up that sentence. First of all, that

1 would not serve the public interest, is that  
2 what that sentence says?

3 A. Yes. And it is in the context of Phase I of  
4 ASR, and the proposal doesn't contemplate  
5 removing credits below the '93 levels for Phase  
6 I.

7 Q. But at least with respect to Phase I going down  
8 below that level, there was a concern that it  
9 would impact the public interest; is that right?

10 A. Yes.

11 Q. And also with respect to Phase I, it was  
12 indicated that it would deteriorate any  
13 established hydraulic barrier created from  
14 recharge injection, was that a concern?

15 A. Sure. The higher the water level is, the more  
16 effective the barrier is in Phase I.

17 Q. Well, I think we are talking about two different  
18 things. We are talking about the overall water  
19 level of the aquifer, and we are talking about  
20 dropping below that minimum index level.

21 A. Right.

22 Q. So, in other words, would you agree with me that  
23 at least in the context of that statement, if  
24 the minimum index level was dropped between that  
25 1993 level to a lower level, at least in the

1 context of this particular statement, by Mr.  
2 Jacobs, would you agree that that wouldn't have  
3 been in the public interest, in his mind?

4 A. Yes.

5 Q. In the very next sentence, another concern Mr.  
6 Jacobs indicates, and a concern he has with  
7 withdrawing water below that lowest index level  
8 is concern of maintaining water quality, would  
9 you agree that's stated in the next sentence?

10 A. Yes.

11 Q. So, in other words, once again Mr. Jacobs'  
12 conclusion was that if water, at least with  
13 respect to ASR Phase I, was withdrawn below that  
14 1993 minimum index level it could impact or  
15 threaten water quality; is that correct?

16 A. It could, but you have to consider that in the  
17 context of operations when it comes to the  
18 proposal. Because with the current terms and  
19 conditions it would result in lower aquifer  
20 levels. In the context of the proposal the  
21 lower index levels would result in higher  
22 aquifer levels.

23 Q. Do you have any knowledge, as far as what has  
24 contributed to the aquifer, either increasing in  
25 the amount of water that's in the aquifer or the

1 water levels lowering? In other words, whether  
2 it's caused by the City of Wichita's use,  
3 industrial use, irrigation use, drought, have  
4 you done any of that modeling or any analysis in  
5 that regard?

6 A. I haven't done any modeling, but I am aware that  
7 since 1993 that the aquifer has recovered and  
8 that's due, in large part, to the City's  
9 adjustment in the way that we use Cheney  
10 Reservoir and the Equus Beds.

11 Q. But as far as any kind of science or research to  
12 try to determine what the cause for that  
13 recovery was, you haven't done any of that  
14 research or studying yourself; is that correct?

15 A. The staff that works for me has, I have not.

16 Q. Okay. How does lowering the minimum index  
17 levels in Phase II affect saltwater movement in  
18 the Arkansas River area, in the Little Arkansas  
19 River area?

20 A. I believe there are others that are more  
21 qualified to answer that than me.

22 Q. Well, just a moment ago you indicated that Mr.  
23 Jacobs believed if we were to lower the minimum  
24 index level with respect to ASR Phase I it would  
25 adversely impact the public interest, and it

1 would also adversely impact water quality. I  
2 guess my question is, do you have any knowledge  
3 about whether or not lowering the minimum index  
4 level with respect to ASR Phase II would have  
5 those same concerns. Do you have any opinion on  
6 that?

7 A. I do not.

8 Q. On the very next page, Page 5 of this letter, it  
9 says, Phase II, at the top of that page, of the  
10 ASR project, do you see that?

11 A. I do.

12 Q. Can you read that sentence for me?

13 A. Phase II of the ASR project was implemented with  
14 the goals of supply development, restoration of  
15 the Equus Beds as a resource and to provide a  
16 sustainable water supply during periods of  
17 drought.

18 Q. So, in other words, the City does at least  
19 recognize that restoration and preservation of  
20 the Equus Beds aquifer is important because it's  
21 a viable resource, is that true?

22 A. Absolutely. That's a foundation of our  
23 proposal.

24 Q. You were asked some questions about the City's  
25 Exhibit Number 20 and it had to do with

1 groundwater levels and it was a USGS document.

2 Do you recall those questions?

3 A. If you could point me to the document, that  
4 would help.

5 MR. STUCKY: Off the record.

6 (A short off-the-record discussion  
7 was held at this time.)

8 BY MR. STUCKY:

9 Q. The purple notebook behind the pink tab called  
10 water levels.

11 A. Okay.

12 Q. A moment ago on Page 9 of that document you  
13 testified regarding some implications regarding  
14 those numbers. But let me just clarify. You  
15 weren't involved in making these calculations or  
16 doing this research or determining these  
17 particular numbers; is that correct?

18 A. No. Not at all. The question that I was asked  
19 was regarding operations and how those were  
20 impacted by the levels that were indicated in  
21 the table.

22 Q. Just so I am clear, you weren't involved in any  
23 of the research that helped to create this  
24 particular report; is that correct?

25 A. No. But I am involved in the operations that

1           were relative to these levels.

2           Q.    You were also asked a question about GMD Exhibit  
3           49.  Just to refresh your memory, I don't have  
4           the document in front of me, but it was the  
5           document that spoke to river levels, and on the  
6           first page of the document instead of picture of  
7           a river it has a picture of a road.  Do you see  
8           that document?

9           A.    I do.  Scientific Investigations Report,  
10          2015-5121.

11          Q.    Just to clarify the record, you weren't involved  
12          in writing that document, or helping to  
13          determine any of research or calculations in  
14          that document either; is that correct?

15          A.    That's correct.

16          Q.    You indicate in your testimony that ASR credits  
17          should be saved as late as possible because it's  
18          advantageous to the city.  Is that a true  
19          statement of your testimony?

20          A.    Yes, as late as possible to the extent that it  
21          provides for the effectiveness as for the  
22          drought, yes.

23          Q.    To save those credits and use them in the last  
24          possible moments at the time of the drought, you  
25          said that's advantageous to the City to be able

1 to use them during that time, is that a true  
2 statement?

3 A. True.

4 Q. If the water then is withdrawn by the City  
5 during a time of drought, and these credits are  
6 withdrawn by the City during a time of drought  
7 and the aquifer has already been depleted,  
8 because of this drought, do you follow me so  
9 far?

10 A. Sure.

11 Q. Although it's advantageous to the City to  
12 withdraw those credits at that time, would it be  
13 advantageous to the aquifer?

14 A. Avoiding unnecessary withdrawals of those  
15 credits early and often, that is not  
16 advantageous. The delaying of the use of those  
17 credits is advantageous. And use of the water  
18 is advantageous just like the use of the water  
19 by all users at that time is advantageous. We  
20 are not any different.

21 Q. I am not speaking about over time, Mr. McLeod  
22 can ask you about those questions over time, if  
23 you know. What I am asking you about is the  
24 exact moment in time, we are in the middle of a  
25 drought, and the City says I want to withdraw

1           some credits and it's advantageous to us because  
2           we want some additional water. At that moment  
3           in time, do you believe it's advantageous for  
4           the rest of the aquifer and the rest of the  
5           water right holders in the aquifer at that point  
6           in time?

7       A.    It is no different than water that's taken out  
8           by any other user.

9       Q.    Well, so if this water is taken out, and it's  
10          depleted from the aquifer, is that advantageous  
11          to the aquifer at that point in time?

12      A.    Relative to the benefit of the levels that are  
13          there, yes.

14      Q.    So it is your testimony that if water is taken  
15          out of the aquifer, I just want to clarify the  
16          testimony, it is your testimony that if someone  
17          drains the aquifer, or they take water out of  
18          the aquifer, that's generally good for the  
19          aquifer? Is that your testimony?

20      A.    I don't understand how you would drain the  
21          aquifer, but that would be bad.

22      Q.    So it's bad, generally, to take water from the  
23          aquifer, just all things being equal, it's  
24          generally not a good thing to take water from  
25          the aquifer?

1 A. No, it's a good thing to take water from the  
2 aquifer. For instance, if a building is on fire  
3 you need to water to put the fire out, so that's  
4 a good thing.

5 Q. Yesterday there was a discussion about the  
6 benefits of withdrawing water from the City. So  
7 what I am trying to get at, is the benefit to  
8 whom? Is the benefit to the building that's  
9 burning? Is the benefit there? Is the benefit  
10 to the aquifer itself? I am trying to draw a  
11 distinction, and I am making a very simple  
12 distinction, in that analogy, if we take 1,000  
13 acre feet of water from the aquifer would you  
14 agree that that water is now taken from the  
15 aquifer?

16 A. Sure.

17 Q. And would you agree that the water levels in the  
18 aquifer would go down if that 1,000 acre feet is  
19 taken?

20 A. Yes.

21 Q. And in the sense that the water level in the  
22 aquifer has gone down, would you agree that the  
23 aquifer has been depleted?

24 A. Sure.

25 Q. And in the sense that the aquifer has been

1           depleted, would you agree that maybe it's a  
2           small detriment, in that particular  
3           hypothetical, but it would be a detriment to the  
4           aquifer itself. Would you agree?

5       A.    I would say the aquifer served it's intended  
6           purpose and is lower as the result.

7       Q.    I will go ahead and move on. With respect to, I  
8           would ask that we -- well, you weren't involved  
9           in any research or planning with respect, well,  
10          I am sorry. You weren't involved in any kind of  
11          calculations as far as projected future water  
12          needs of the City, were you involved in those  
13          calculations?

14      A.    In the calculations, no.

15      Q.    I ask that you now flip to Exhibit 1, the City's  
16          Exhibit 1, it's the proposal.

17      A.    (Witness reviews documents).

18      Q.    You talked about some permit conditions that are  
19          utilized in the City's proposal; is that  
20          correct?

21      A.    I did.

22      Q.    And you walked through several of those, and I  
23          think you talked about Number 1, Number 2,  
24          Number 3 and Number 4.

25      A.    Yes. And I appreciate it if you could point me

1           where that is, so that we could be on the same  
2           page.

3       Q.    It is in the black notebook, it follows the red  
4           tab called Proposal.

5                       MR. STUCKY:   May I approach the  
6           witness?

7                       THE HEARING OFFICER:   Yes.

8       A.    Thank you.

9                       BY MR. STUCKY:

10      Q.    We are on the same page; is that correct?

11      A.    Yes.

12                      THE HEARING OFFICER:   I may not be.

13                      MR. STUCKY:   I will approach.   Just to  
14           clarify the record, I think that the page  
15           numbers are somewhat unusual in this document,  
16           so I think the page number actually is 3-5 and  
17           the section is 3.4, just for the record.

18                      BY MR. STUCKY:

19      Q.    So with respect to section 3.4, Proposed AMC  
20           Permit Conditions would you agree that your  
21           testimony related to conditions 1 through 4?

22      A.    Yes.

23      Q.    With respect to permit condition Number 2, could  
24           you sum that one up for me again, just so I am  
25           clear.

1 A. Sure. The rate of accrual of all recharged  
2 credits cannot exceed the constructed physical  
3 diversion capacity of the ASR system, including  
4 direct surface water diversions and future bank  
5 storage wells, and will be limited to the rate  
6 and quantity authorized by Water Right Number  
7 46627. And I believe that's referring to the  
8 surface water right for ASR diversion, I believe  
9 it's 45,260 acre feet or thereabouts.

10 Q. That's the quantity of that water, right?

11 A. That's pretty close.

12 Q. Now, with respect to Number 4. It says:  
13 Therefore, the combined total quantity of AMCs  
14 and physical recharge credits cannot exceed  
15 120,000 acre feet.

16 A. Correct.

17 Q. Is that 120,000 number, is that 120,000 acre  
18 feet in a certain period of time? Or is the  
19 idea, or the concept, that the City can have up  
20 to 120,000 acre feet of accumulated credits at  
21 any given time? Is that the concept?

22 A. Well, the concept, right now there is no cap.  
23 So there were concerns expressed by individuals,  
24 when we did outreach, that the City should have  
25 a limit on the total number of credits that it

1           could accumulate. So it was reasonable to put a  
2           cap in place that was the amount of the storage  
3           within the central well field area.

4       Q.    Let me ask it this way, if we have 120,000 acre  
5           foot cap, and let's say hypothetically the City  
6           accumulates all 120,000 of those acre feet. Do  
7           you follow me so far?

8       A.    Sure.

9       Q.    And then the City uses 10,000 of those acre  
10          feet, can the City then accumulate another  
11          10,000 acre feet in the future to get back to  
12          that 120,000 acre foot cap?

13      A.    Yes.

14      Q.    Also in Number 4 it says, this 120,000 acre feet  
15          was calculated because it estimated 11.7% of  
16          total available aquifer storage. Is that what  
17          that portion says?

18      A.    It says that the 120,000 acre feet represents  
19          11.7%, yes.

20      Q.    Of storage capacity of the well field?

21      A.    The central well field storage area.

22      Q.    Does the City own the storage space in the  
23          aquifer?

24      A.    The City has a right to the water that's in the  
25          aquifer.

1 Q. But the City doesn't own the storage space,  
2 correct?

3 A. I don't know.

4 Q. And so you also don't know who would,  
5 hypothetically, who would conceptually own that  
6 storage space? You don't have an opinion on  
7 that either?

8 A. I don't understand your hypothetical, I don't  
9 know, I don't have an opinion on that.

10 Q. I think you already testified to this, but you  
11 don't have any knowledge about whether or not  
12 lowering the minimum index levels in the Equus  
13 Beds well fields, you don't have any knowledge  
14 about whether or not lowering that minimum index  
15 levels would impact the migration of the  
16 chloride plume? Have you done any research in  
17 that regard?

18 A. I haven't done any research.

19 Q. You haven't done any calculations with respect  
20 to the 1% drought; is that correct?

21 A. I have not.

22 Q. So any opinions with respect to the 1% drought  
23 would be purely your speculation; is that  
24 correct?

25 A. It would be based upon the work done by others.

1 Q. And whether or not the 1993 levels are a good  
2 limitation, would your opinions in that regard  
3 be based strictly upon the research or work done  
4 by others?

5 A. Depends upon what kind of work you are referring  
6 to. If you are talking about modeling it would  
7 be done by others.

8 Q. In other words, you haven't done any independent  
9 research in that regard; is that correct?

10 A. No.

11 Q. And as far as the mechanics of the aquifer  
12 maintenance credits, are you an expert on the  
13 mechanics of how those aquifer maintenance  
14 credits would operate or work?

15 A. What do you mean by mechanics?

16 Q. In other words, if I were to walk through how  
17 these aquifer maintenance credits would work  
18 conceptually, is that something that you are  
19 able to testify to?

20 A. Sure.

21 Q. So if we were to withdraw, if the aquifer is  
22 full, and the City uses the water in, pumps it  
23 directly from the Little Arkansas River, would  
24 that water then be used pursuant to a municipal  
25 use at that time?

1 A. Sure, it would either be injected in to the  
2 ground for future use, it could be sent directly  
3 to town for retreatment and immediate use.  
4 Sure.

5 Q. So if we are assuming the aquifer is full, the  
6 water has been sent directly to the City, you  
7 would agree that that water would be consumed at  
8 that point; is that correct?

9 A. Yes.

10 Q. And would you also agree with Mr. Pajor's  
11 testimony that if an aquifer maintenance credit  
12 is accumulated, that subsequent water would then  
13 be withdrawn from the aquifer?

14 A. There would be -- there could be a gallon of  
15 water drawn at some point in time that was left  
16 in as an offset for the water that was sent to  
17 town, yes.

18 Q. Is it the City's belief that the mechanics, as  
19 far as how that water, with respect to an  
20 aquifer maintenance credit, can be taken, is it  
21 the City's belief that that should be determined  
22 as at a later time? Or is that part of the  
23 subject of this hearing?

24 A. I am -- could you rephrase your question?

25 Q. Well, in other words, if aquifer maintenance

1 credits are accumulated, and then in the future  
2 the City can withdraw water, pursuant to those  
3 aquifer maintenance credits, is it the subject  
4 of this hearing to determine how and when that  
5 water could be withdrawn? Or is that subject  
6 matter to be determined at a later time?

7 A. Ask it one more time because I believe that  
8 would be -- well, please ask again.

9 Q. Okay. If we accumulate an aquifer maintenance  
10 credit, there would be a right, as you just  
11 indicated --

12 A. Right.

13 Q. -- to take future water out of the aquifer,  
14 correct?

15 A. Correct.

16 Q. My question is, under the conditions that that  
17 future water could be taken out of the aquifer,  
18 are those conditions part of this hearing today  
19 or would that be determined at a later time as  
20 far as what that would look like and how the  
21 City could take out that water?

22 A. There are no terms and conditions, as you  
23 described that, within the current proposal.

24 Q. Now, as far as determining whether or not  
25 lowering the minimum index levels would be good

1 for the aquifer, once again, you haven't done  
2 any research in that regard; is that correct?

3 A. Not directly.

4 Q. Okay. And you haven't done any research  
5 regarding whether or not water quality would be  
6 impacted in the aquifer; is that correct?

7 A. Not myself.

8 Q. And you haven't done any research about whether  
9 or not minimum desirable stream flows would be  
10 protected; is that correct?

11 A. I haven't done any research. I have reviewed  
12 work and read reports.

13 Q. And you haven't done any research about whether  
14 or not any kind of technical analysis to  
15 determine whether or not the City's proposal is  
16 in the public interest, correct?

17 A. I have opinions on that, but I haven't done the  
18 research or the modeling myself, no.

19 Q. In your expert report, on about the fourth page  
20 of your expert report, you indicate that short  
21 duration uses of ASR credits during drought will  
22 accelerate the plume's progress by as much as 40  
23 percent. Do you recall writing that in your  
24 report?

25 A. I recall that that's in the report, yes.

1 Q. So, in other words, when recharge credits are  
2 withdrawn, within a short period of time would  
3 you agree that your report says that that would  
4 accelerate the migration of that chloride plume  
5 by as much as 40 percent?

6 A. Yes.

7 Q. So at least in the sense of when that water is  
8 withdrawn in that narrow period, if the chloride  
9 plume is accelerated by 40 percent, if water is  
10 being taken out of the aquifer at that time,  
11 would you agree that, at least as it indicates  
12 in your expert report, in that particular point  
13 in time it would be a detriment to the aquifer?

14 A. Yes.

15 Q. As far as you would define it, would that cause  
16 impairment to the aquifer at that time?

17 A. I don't know what the concentrations would be or  
18 anything else. I have no idea.

19 MR. STUCKY: No further questions.

20 THE HEARING OFFICER: Ms. Wendling.

21 MR. OLEEN: Actually, if I may.

22 THE HEARING OFFICER: Yes.

23

24 CROSS EXAMINATION

25 BY MR. OLEEN:

1 Q. Mr. Henry, do you recall a line of questioning  
2 on cross examination, questioning by Mr. Stucky,  
3 on the potential affects of water quality if  
4 water levels are lowered to the current 1993  
5 permissible bottoms?

6 A. Yes.

7 Q. If you would please turn to GMD's Volume II  
8 notebook up there.

9 A. (Witness reviews documents).

10 Q. Once you have that Volume II if you would turn  
11 to what GMD has labeled as Exhibit 27.

12 A. Okay.

13 Q. Do you see that this document is titled,  
14 Memorandum of Understanding between GMD2 and the  
15 City of Wichita regarding Wichita's proposed ASR  
16 Phase II?

17 A. Yes, sir.

18 Q. If you turn to the last page of this document,  
19 do you see where it was signed by Carl Brewer,  
20 the mayor of Wichita?

21 A. Yes.

22 Q. And also signed by Bob Seiler, the president of  
23 GMD2.

24 A. Yes.

25 Q. Are you familiar with this document in any way?

1 A. I have seen it a time or two. It's been awhile.

2 Q. Do you recall the circumstances under which this  
3 document was executed between those two parties?

4 A. That would have been before my involvement.

5 Q. If we turn to numbers 5 and 6, in this document,  
6 do you see those?

7 A. I do.

8 Q. Do you see where Number 5, issue Number 5 asks  
9 how can the City protect domestic wells from  
10 changes and water quality standards? Do you see  
11 that?

12 A. Yes.

13 Q. Would you please read, to yourself, the answer  
14 in the form of a commitment there, and tell me  
15 if you recall that answer and having personal  
16 knowledge of it.

17 A. (Witness reviews document). Yes.

18 Q. Okay. Can you explain to me what this  
19 commitment from Wichita was at the time  
20 regarding this stated issue, Number 5?

21 A. The water that comes out of the tap in a home or  
22 a business served by a private domestic well, is  
23 just as important as the water that comes out of  
24 the tap of a customer of the city. The use of  
25 that water by them is just as critical as it is

1 for anyone. And the intent of this is to make  
2 sure that those individuals are protected from  
3 any degradation that activities by the City  
4 would cause, for certain wells.

5 Q. So is it the case that at the time this MOU was  
6 in force -- well, first let me ask you. Do you  
7 know is if this MOU is still in force?

8 A. I don't know whether it is or is not. I believe  
9 it is in the memo that it suggests, I don't know  
10 that it's a requirement, but suggests that there  
11 are periodic reviews and updates of the memo,  
12 and I don't know if that's ever occurred.

13 Q. Do I understand then that at the time this memo  
14 was executed, and at least to the extent that it  
15 was enforced, the City was making a commitment  
16 to certain domestic wells that might be affected  
17 by the City's Phase II ASR activity with respect  
18 to water quality; is that correct?

19 A. Absolutely.

20 Q. Moving on to the next issue, Number 6. Where it  
21 says: How will the City protect domestic water  
22 wells within 660 feet of a project recharge and  
23 recovery well from adverse drawdown impacts that  
24 may result in the operation of the well. Do you  
25 see that issue?

1 A. Yes.

2 Q. Would you read to yourself the subsequent  
3 commitment regarding that issue.

4 A. (Witness reviews document). Okay.

5 Q. Can you explain to me, in summarized form, what  
6 the City's commitment was with respect to that  
7 issue Number 6 regarding potential adverse  
8 drawdown impacts that may result from City's  
9 operations of an ASR well?

10 A. Sure. The City's commitment is to redrill or  
11 take other appropriate affirmative action to  
12 restore the productivity of such domestic well  
13 to the same rate and quality as it existed prior  
14 to.

15 Q. So at least at the time that this MOU was  
16 executed, and in force, the City was making this  
17 commitment to provide certain water quantity  
18 protections to certain domestic wells that may  
19 be affected by Wichita's usage of ASR wells; is  
20 that correct?

21 A. Absolutely. The City of Wichita is in the  
22 business of providing water to people, not  
23 taking water away. So we would continue that  
24 commitment under this proposal, and even be  
25 willing to formulate terms and conditions in the

1           permits, parallel to this or perhaps even better  
2           than this.

3       Q.    So when you say that Wichita would be willing to  
4           formulate permit conditions with respect to  
5           this --

6       A.    Yes.

7       Q.    -- you mean the proposal that we are considering  
8           here today?

9       A.    Absolutely.

10      Q.    Would you then also please turn with me back in  
11           the black binder to what has been previously  
12           marked as Wichita's Exhibit Number 21.

13      A.    Could you help me find that, please.

14                   MR. OLEEN:  If I may approach the  
15           witness?

16                   THE HEARING OFFICER:  Yes.

17      A.    If you could tell me which tab it is behind.

18      Q.    It is behind the tab Proposal Correspondence.

19                   THE REPORTER:  Just a minute, the  
20           notebooks are falling over.

21                               (A short off-the-record discussion  
22                               was held at this time.)

23      A.    Page 121.

24      Q.    Page 121.  Behind the tab Proposal  
25           Correspondence in the black binder it is

1           previously been marked Wichita Exhibit 21. It  
2           starts on Page 121. Are you there yet?

3       A.    Yes.

4       Q.    Do you recall this letter that we previously  
5           discussed that was from Alan King with Wichita  
6           to Chief Engineer Barfield?

7       A.    Yes.

8       Q.    Would you turn to Page 126 and paragraphs 12 and  
9           13.

10      A.    Yes.

11      Q.    Do you see those?

12      A.    Yes.

13      Q.    Does paragraph 12 of this letter essentially  
14           address the same water quality commitment that  
15           we just discussed that Wichita committed to in  
16           the MOU that we just discussed?

17      A.    It does.

18      Q.    And looking down then to paragraph 13, does that  
19           essentially address the same commitment that  
20           Wichita had committed to regarding domestic well  
21           quantity that was committed to in the MOU that  
22           we discussed?

23      A.    It does.

24      Q.    And just to be clear here today, do you know if  
25           these commitments that, I believe you just said

1           Wichita is still willing to commit to today; is  
2           that right?

3           A.    Yes.

4           Q.    Do you know if these particular commitments are  
5           enumerated in the proposal itself that we are  
6           talking about at this hearing?

7           A.    I am not certain, but I believe I recall that  
8           they are not.

9           Q.    Okay.  If they are not though, it is your  
10          testimony today that Wichita is agreeable to  
11          having such commitments that protect domestic  
12          well water quality and quantity in the ways that  
13          Wichita was previously committed to that Wichita  
14          is willing to have those also be imposed as  
15          conditions assuming this proposal is approved?

16          A.    Yes.  Hundred percent committed.

17                   MR. OLEEN:  If I may approach, Madame  
18                   Officer, I would like to label the memorandum of  
19                   understanding as GMD's Exhibit 27.

20                   THE HEARING OFFICER:  That's fine.

21                   MR. OLEEN:  And also ask that it be  
22                   admitted.

23                   (GMD Exhibit 27 was marked for  
24                   identification by the Reporter.)

25                   THE HEARING OFFICER:  Any objections?

1 GMD 27 is admitted.

2 MR. OLEEN: No further questions.

3 THE HEARING OFFICER: Ms. Wendling.

4

5 CROSS EXAMINATION

6 BY MS. WENDLING:

7 Q. Mr. Henry, regarding these terms in the MOU Mr.  
8 Oleen was just asking you about, there is a 660  
9 feet limitation on the quantity issues. If it's  
10 shown that water quality or quantity for  
11 domestic well users have impacted beyond the 660  
12 feet, is the City similarly committed to  
13 resolving those issues?

14 A. Beyond 660 feet, I have no opinion on that at  
15 this time. I think we are open to  
16 considerations.

17 Q. Okay. What burden does the City anticipate  
18 these individuals are needing to prove in order  
19 to show that the quantity or quality is  
20 impacted?

21 A. That is problem with the MOU, there is a nod  
22 that the City will take certain actions, but  
23 there is no framework or anything that says how  
24 it would be triggered or handled. I could  
25 imagine in such a way that if there is a way to

1 predict, right, based upon sound science, we all  
2 agreed on, and it is reasonable to believe it is  
3 going to happen, that we would, we want to  
4 prevent it from happening. I can't sit here  
5 today and tell you how that would work, but it  
6 would be a desire to keep people, you know,  
7 let's not wait until they run out of water,  
8 let's fix their well ahead of time.

9 Q. The City is willing to take a proactive approach  
10 to preventing any quality or quantity issues?

11 A. Absolutely.

12 Q. To your knowledge has the City done any analysis  
13 to understand the number of wells or users that  
14 might be impacted?

15 A. I am not aware of any. I know that we have done  
16 some work in regards to agriculture wells, I am  
17 not sure about domestic wells.

18 Q. If I could turn your attention to City Exhibit  
19 19, which is in the black binder under Proposal  
20 Correspondence.

21 A. Okay. Which page?

22 Q. I will be on Page 5. I believe it was either  
23 you or Mr. Pajor who testified that this  
24 proposal is before us due to a change in use of  
25 the ASR program to drought planning; is that

1 correct?

2 A. Correct.

3 Q. Can you read the first sentence on Page 5 of  
4 Exhibit 19, which is dated May 2013.

5 A. Phase II of the ASR project was implemented with  
6 goals of supply, development, restoration of the  
7 Equus Beds as a resource, and to provide as a  
8 sustainable water supply during periods of  
9 drought.

10 Q. So according to that sentence, Phase II was also  
11 designed to provide water during a drought?

12 A. Phase II was, yes.

13 Q. Could we now go back, still in the black binder  
14 Exhibit 1, which was your proposal. I believe  
15 2-1.

16 A. I am sorry, 2?

17 Q. 2.1.

18 A. Okay.

19 Q. Okay. And you will see a table 2-1 on that same  
20 page regarding the drought response plan.

21 A. Yes.

22 Q. And it says various triggering points for the  
23 stages in the drought plan; is that correct?

24 A. Yes.

25 Q. Do you have data on how often stages 1, 2, 3 or

1 4 of the drought response plan would be  
2 triggered based upon historical genealogy  
3 levels?

4 A. The City has some data, yes.

5 Q. Do you know if that has been included in the  
6 proposal or attachments?

7 A. I don't know.

8 Q. Now, if we turn to the Exhibit A of the  
9 proposal, which if you are still in the black  
10 binder you go to the orange attachments tab,  
11 it's the first attachment.

12 A. Okay.

13 Q. We discussed yesterday that the goal of the  
14 proposal is to prevent the City from needing to  
15 enact stages 3 and 4 in the event of a 1%  
16 drought, is that also your understanding?

17 A. Correct.

18 Q. Were you involved in preparing this document?

19 A. I was not.

20 Q. If you go to Page 6 under stage 3, can you read  
21 the third bullet point on the right.

22 A. Eliminate irrigation on city owned grasses that  
23 are not exempted due to the economic activity  
24 they create.

25 Q. So is it your understanding that during a 1%

1 drought, because we are successful in not going  
2 to stage 3, irrigation would be able to  
3 continue?

4 A. I am sorry, would you repeat your question?

5 Q. If the City has not yet triggered stage 3,  
6 irrigation would be able to continue, is that  
7 what that bullet point means?

8 A. (Witness reviews document). I think what the  
9 bullet point says is eliminate irrigation on  
10 city owned grasses that are not exempted due to  
11 economic activity. The City of Wichita at the  
12 time that the drought response plan was being  
13 developed also included some other measures that  
14 were just internal objectives, so to speak,  
15 weren't part of the formal plans and commitments  
16 that were made at that point in time. And some  
17 of those measures were likely more restrictive  
18 than what was put on the public.

19 Q. I actually had you read the wrong one. Would  
20 you read the third bullet point on the left-hand  
21 column for utility.

22 A. For customers?

23 Q. Yes.

24 A. Yes. Exceptions provided for businesses  
25 generating economic activity directly from

1 outdoor irrigation.

2 Q. So understanding that, it's not until stage,  
3 well, at stage 3 there are exceptions for  
4 irrigation?

5 A. There are exceptions for the irrigation  
6 restrictions under stages 2 and 3.

7 Q. Okay. Let's go back to Page 4 where we talk  
8 about stage 2. Under utility customers.

9 A. Yes.

10 Q. Do you see restrictions on irrigation under  
11 that, under stage 2, actions utility customers.

12 A. (Witness reviews document). Are you saying do I  
13 see restrictions?

14 Q. On irrigation.

15 A. Outdoor water usage is prohibited from 10:00  
16 a.m. to 8:00 p.m. on all days. It is not  
17 allowed at all on Saturdays, Sundays or Mondays.

18 Q. All right. And then there is, that would be,  
19 well, there are no exceptions?

20 A. There are exceptions under stage 2, I don't know  
21 that they are stated here, but under stage 2 and  
22 stage 3 there are exceptions for those  
23 businesses where there is economics involved  
24 with outdoor watering.

25 Q. Do you believe there is economic benefit to

1 agriculture production using irrigation?

2 A. Absolutely.

3 Q. Mr. Stucky asked you several questions about  
4 water supply options, and this was in City's  
5 Exhibits 17 and 18 of the water supply  
6 PowerPoint presentation. And in those documents  
7 several water supply options were identified; is  
8 that correct?

9 A. I believe there were some concepts of some  
10 options, yeah.

11 Q. Would you agree with the statement that the City  
12 has water supply alternatives other than the  
13 current proposal to meet their needs during a  
14 drought?

15 A. There were other alternatives considered,  
16 whether they were feasible or not.

17 Q. But there are other options?

18 A. There could be other options.

19 Q. He also asked you about the minimum index level,  
20 is it your understanding that the minimum index  
21 levels should be based on the amount of water  
22 the City wants to access?

23 A. No.

24 Q. Should the minimum index levels be based on an  
25 analyzed level demonstrated to show a

1           sustainable and healthy aquifer?

2       A.    Yes.   The minimum index levels would be in place  
3           to allow the City to operate in such a way that  
4           higher aquifer levels would be an outcome.

5       Q.    And Mr. Stucky also asked you if the City owns  
6           the storage space in the aquifer, and I believe  
7           you did not have an answer; is that correct?

8       A.    Well, my answer was that the City has rights to  
9           access the water that's within that storage  
10          space.

11      Q.    Access.   A right to access the water does not  
12          mean you own the property that might be above  
13          the water; is that correct?

14      A.    Sure.

15      Q.    And do you own property in Kansas?

16      A.    I do not.

17      Q.    You do not.   Are you familiar with the property  
18          rights in Kansas?

19      A.    Somewhat.

20      Q.    Do you know how far above or below the surface  
21          level of property right extends?

22      A.    I do not.

23      Q.    Going back to the proposal once again, 3-4 of  
24          the proposal, still in the black binder, it has  
25          the proposed permit conditions.   You have

1 testified regarding --

2 A. I am sorry, where are we in the black binder?

3 Q. The black binder, the red tab Page 3-6.

4 A. (Witness reviews documents). 3-6; is that  
5 correct?

6 Q. Correct.

7 A. Okay.

8 Q. Of the permit conditions listed on Page 3-6 do  
9 you see a permit condition that limit of AMCs  
10 only during a period of drought?

11 A. No.

12 MS. WENDLING: I have no further  
13 questions.

14 THE HEARING OFFICER: Mr. McLeod.

15 MR. McLEOD: Before I begin redirect  
16 would it be possible to take a short five-minute  
17 recess?

18 THE HEARING OFFICER: Of course. Off  
19 the record.

20 (REPORTER'S NOTE: At this time,  
21 11:07 a.m., a recess was taken,  
22 after which, 11:15 a.m., the following  
23 proceedings were held:)

24 THE HEARING OFFICER: Back on the  
25 record after a short break.

1

2

REDIRECT EXAMINATION

3

BY MR. McLEOD:

4

Q. Mr. Henry, Mr. Stucky had asked you if you take  
5 1,000 feet of acre feet from the aquifer was the  
6 aquifer reduced, I think you agreed it was. If  
7 you take that 1,000 acre feet from the aquifer  
8 and you don't put it back, the next year is the  
9 aquifer still lower than if you had not taken  
10 that 1,000 acre feet?

11

A. Sure.

12

Q. You had indicated in response to questions as  
13 well that there are not conditions currently in  
14 the proposal document itself as to when, and the  
15 circumstances under which AMC credits could be  
16 withdrawn; is that correct?

17

A. Yes.

18

Q. And Mr. Stucky had asked you, I think he  
19 intended to ask you, whether the purpose of this  
20 hearing was perhaps to decide those conditions.  
21 And so I will phrase the question this way, if  
22 you remember, for example, the discussion during  
23 Mr. Pajor's testimony yesterday about a  
24 potential condition to provide, in some fashion,  
25 that the AMCs would be drawable under certain

1           circumstance or extent of defined drought, if  
2           the Hearing Officer found that that was an  
3           appropriate condition that should be included in  
4           any permit, can she find that and include such  
5           condition as part of this hearing?

6       A.    Of course.  Terms and conditions of the permits  
7           under this proposal, absolutely.

8       Q.    And equally, I mean, if she found that well  
9           protections, parallel to those that were  
10          provided in the old MOUs were appropriate, she  
11          could include those?

12      A.    Sure.

13      Q.    Mr. Stucky had asked you if at the moment that  
14          you draw a credit, and thereby, reduce the  
15          aquifer, if at that moment that is a detriment  
16          to the aquifer; and my question on the converse  
17          of that assumption is, is it a benefit until  
18          that credit is drawn that you waited to draw it?

19      A.    Sure.

20      Q.    If you wait long enough, and the drought is over  
21          and you don't have to draw it at all, is that a  
22          benefit?

23      A.    Yes, that results in higher aquifer levels, you  
24          bet.

25      Q.    Is there any benefit to making the City draw

1           that credit and create the detriment earlier  
2           than it needs to to satisfy its water needs?

3       A.    No.   That would be undesirable.

4       Q.    Ms. Wendling I think had pointed out in terms of  
5           the discussion of how much redirection this  
6           drought scenario is in ASR Phase II, that  
7           drought supply was one of the purposes mentioned  
8           as being a purpose of ASR Phase II initially.

9                   My question, to help clarify, is it  
10           really more accurate to say that that drought  
11           purpose has become more important with the  
12           changes and circumstances for ASR Phase II?

13      A.    Absolutely.   That's the value of the ASR Phase  
14           II credits are for additional supply during  
15           prolonged drought.

16      Q.    Mr. Stucky had asked you a question, actually a  
17           short series of questions, about statements that  
18           Mike Jacobs had made about reducing index levels  
19           from the 1993 levels for the Phase I project not  
20           being in the public interest.   Was that very  
21           specific to the Phase I facilities?

22      A.    Yes.

23                   MR. McLEOD:   I don't have further  
24           questions.

25                   MR. OLEEN:   Thank you, but no

1 questions.

2 THE HEARING OFFICER: Okay. Mr.  
3 Stucky.

4 MR. STUCKY: Thank you.

5

6 RE CROSS EXAMINATION

7 BY MR. STUCKY:

8 Q. Just a few additional questions. A moment ago  
9 you were asked about an MOU, which is Exhibit 27  
10 in the District's notebooks. Do you recall that  
11 line of questioning by Mr. Oleen?

12 A. Yes.

13 Q. And Mr. Oleen, I believe in his line of  
14 questioning, was drawing parallelism between  
15 Exhibit 21, which was the letter from Jacobs and  
16 that MOU, do you recall those questions?

17 A. Yes. I don't recall whether the letter was from  
18 Mr. Jacobs or Mr. King.

19 Q. My mistake. Yes, Exhibit 21 that letter was  
20 from Mr. King. But would you agree that Mr.  
21 Oleen was asking you questions with respect to  
22 the parallelism between that letter and the MOU?

23 A. Yes.

24 Q. And, in fact, in this letter from Mr. King, he  
25 indicated that the City was committed to

1 maintaining the water quality of domestic wells  
2 within 660 feet of ASR physical recharge sites.  
3 Would you agree that's what is stated in that  
4 letter?

5 A. Yes.

6 Q. I ask that you flip in the Volume II of the  
7 GMD's exhibit notebooks to Exhibit 27.

8 A. (Witness reviews documents). Okay.

9 Q. With respect to commitment Number 5, you  
10 indicated that commitment Number 5 indicated  
11 that it's designed to target water quality. Is  
12 that the commitment with respect to water  
13 quality?

14 A. Yes.

15 Q. Can you read the commitment, in commitment  
16 Number 5 in the Memorandum of Understanding, and  
17 show me where it references 660 feet as far as  
18 protecting water quality only within 660 feet of  
19 domestic wells.

20 A. Issue Number 5 in regards to water quality does  
21 not reference 660 feet.

22 Q. So, in other words, there is a difference  
23 between the Memorandum of Understanding on one  
24 hand, and this letter from Mr. King on the other  
25 hand, in the sense that at least with respect to

1 the Memorandum of Understanding, it was designed  
2 to protect water quality for the whole aquifer,  
3 would that be an accurate statement?

4 A. It doesn't say aquifer, but it also doesn't list  
5 any separation distances.

6 Q. Well, does it say in the very second line, let's  
7 see, does it say in the very first line that  
8 it's for all future domestic wells and existing,  
9 all existing and future domestic wells, is that  
10 what it states?

11 A. Are you referencing the letter?

12 Q. I am referencing the first line of the  
13 commitment. It says water quality or future and  
14 existing wells, is that what it says?

15 A. It does.

16 Q. So as far as you the just plain reading of that  
17 language, does it appear that the commitment is  
18 to protect all existing and future domestic  
19 wells throughout the well field, is that what  
20 that commitment appears to state?

21 A. It doesn't say anything spatially, it just  
22 references future domestic wells.

23 Q. At the very least, it doesn't limit it to  
24 domestic wells to 660 feet of the recharge  
25 sites; is that correct?

1 A. Correct.

2 Q. Yesterday Mr. Pajor indicated that it was  
3 important that if spacing waivers were granted  
4 that those, that those conditions under which  
5 they were granted were important conditions, do  
6 you recall that testimony?

7 A. Yes.

8 Q. Would you also agree that those conditions under  
9 which those, any spacing waivers were granted  
10 for ASR Phase II, were important conditions?

11 A. Yes.

12 Q. Would you also agree that to the extent those  
13 spacing waivers were granted, and those  
14 conditions are in place, those same conditions  
15 should also apply to this AMC proposal?

16 MR. McLEOD: Do we mean for those wells  
17 that the spacing wells were granted for?

18 MR. STUCKY: Yes.

19 A. Yes.

20 BY MR. STUCKY:

21 Q. Would that also apply to a consideration of  
22 lowering the minimum index levels, those same  
23 conditions?

24 A. Yes.

25 Q. And, in fact, if we were to move back to

1           commitment Number 5 on that page in front of  
2           you, just a minute, I lost my spot, does it at  
3           least somewhere in Memorandum of Understanding  
4           indicate that the conditions under which spacing  
5           waivers are granted are important conditions  
6           that should be honored?

7           A.    I think that's a reasonable assumption.

8           Q.    If we were to turn to Page 3, under B-1, and if  
9           we look at --

10          A.    Hold on just a second, you said under -- these  
11          page numbers aren't numbered.

12          Q.    I am sorry.  It's one, 2 --

13          A.    B-1, I found it.

14          Q.    B-1.

15          A.    Yes.

16          Q.    And if we, could you read the last line of that  
17          particular commitment.

18          A.    Sure.  A petition for waiver of the well spacing  
19          requirement shall be submitted to GMD2 and shall  
20          be granted by GMD2 upon finding that the  
21          conditions set out above do exist and that the  
22          granting of the waiver will not unreasonably  
23          impair the public interest.

24          Q.    So, in other words, those conditions are  
25          essential conditions and those conditions should

1           be honored with respect to how those spacing  
2           waivers were granted; is that correct?

3       A.    Yes.

4       Q.    If I heard your testimony correctly when you  
5           were responding to Ms. Wendling just a moment  
6           ago, I believe you said that although the City  
7           is committed to protecting domestic wells within  
8           660 feet of the City's recharge wells, the City  
9           could do more. Is that what your testimony was?

10      A.    I don't know if it could do more. I mean, you  
11           are trying to tie that to 660 feet. I don't  
12           know if that's what I said.

13      Q.    I am asking you, is the City committed to  
14           protecting domestic wells beyond 660 feet,  
15           that's my question.

16      A.    Beyond 660 feet? I don't know.

17      Q.    What's the total authorized quantity of all of  
18           the City's existing water rights?

19      A.    I don't know that off the top of my head.

20      Q.    What total population does the City serve  
21           including all wholesale sites to other cities?

22      A.    Roughly 500,000.

23                   MR. STUCKY: I don't have any further  
24           questions.

25                   THE HEARING OFFICER: Ms. Wendling.

1

2

FURTHER RECROSS EXAMINATION

3

BY MS. WENDLING:

4

Q. In keeping with the goal of maintaining a fuller  
5 aquifer whenever possible, has the City  
6 considered utilizing all of their Cheney rights  
7 prior to pumping from the Equus Bed?

8

A. Not to my knowledge.

9

Q. And do you know who decided that the goal of  
10 drought planning should be to survive a 1%  
11 drought without triggering stages 3 and 4 of the  
12 drought plan?

10

11

12

13

A. That's policy direction that's handed out by  
14 council, the City Council.

14

15

MS. WENDLING: No further questions.

16

THE HEARING OFFICER: Mr. McLeod.

17

MR. McLEOD: I don't have further

18

questions for the witness.

19

THE HEARING OFFICER: Are there any

20

further questions for Mr. Henry? Okay. Hearing

21

none, Mr. Henry, you are excused. It's 11:30.

22

Do we wish to take an early lunch break or

23

should we proceed for about another 30 minutes

24

to an hour?

25

MR. STUCKY: I would prefer to proceed.

1 THE HEARING OFFICER: Go ahead. Mr.  
2 McLeod, next witness, please.

3 MR. McLEOD: City will call Scott Macey  
4 to the stand.

5 SCOTT MACEY,  
6 was thereupon called as a witness herein, and  
7 after having first been duly sworn to testify to  
8 the truth, the whole truth and nothing but the  
9 truth, was examined and testified as follows:

10

11

DIRECT EXAMINATION

12

BY MR. McLEOD:

13

Q. Please state your name for the record.

14

A. Scott Macey.

15

Q. Mr. Macey, do you have any post secondary  
16 educational degrees?

17

A. I have a Bachelor of Science in civil  
18 engineering from the University of  
19 Missouri-Rolla.

20

Q. Do you have any professional licenses or  
21 registrations?

22

A. I am a registered professional engineer in the  
23 State of Kansas.

24

Q. Where are you employed?

25

A. With the City of Wichita in the public works

1 division.

2 Q. And how long have you been employed with the  
3 City?

4 A. Since late 2014.

5 Q. What is your title at the City?

6 A. I am the water resources engineer.

7 Q. And what's the nature of that job?

8 A. I make recommendations to our upper management  
9 in terms of the available water supplies that we  
10 have, analyze the trends in water demands that  
11 are occurring and may occur. Operate the  
12 competition models to inform them as to the  
13 direction those trends might go.

14 Q. How have you been involved with the City's  
15 proposal?

16 A. I have the responsibility for the initial  
17 demands placed on the aquifer in the later  
18 portion, or the latter portion of the proposal's  
19 construction. That's a product of lots of  
20 modeling on my part to minimize the use of the  
21 ASR credits. My modeling exercise different  
22 water resources during the drought of record.  
23 And with the goal of minimizing the ASR credits,  
24 as they are the most expensive for us, and also  
25 to maximize the other resources as the water

1 plan will allow.

2 Q. So the demand projections that have been  
3 discussed, and the testimony of Mr. Pajor, for  
4 example, when he was on the stand, were you the  
5 person who put together the demand projections  
6 for purposes of the proposal?

7 A. I put together the demand projections that were  
8 placed on the Equus portion of the proposal.  
9 Those were constructed as the result of the  
10 efforts of my other work in the MODSIM  
11 simulations.

12 Q. Okay. And I was going to ask you that question,  
13 whether the MODSIM DSS was the model that you  
14 referenced?

15 A. Yes. That's one of the models that I operate.

16 Q. Is that the model you would have used to  
17 optimize resources to meet demand?

18 A. Yes, sir.

19 Q. And just to fill out the record on that, when  
20 you use the term optimize, what do you mean?

21 A. Try to minimize the use of the ASR credits,  
22 maximize the use other renewable credits that  
23 occur each year as a part of our water rights.

24 Q. What's the purpose of minimizing the amount of  
25 ASR credits used?

1 A. Well, first of all, they would have to be  
2 accrued. And that is uncertain at this point.  
3 And then also the initial cost of the creation  
4 of that water. Long term, the projections for  
5 gathering that water from the river are even in  
6 question because of the potential climate  
7 change.

8 Q. Is there a consideration when you optimize  
9 resources of keeping Cheney useful under all  
10 circumstances?

11 A. I am sorry, ask that again.

12 Q. When you are optimizing resources, is one of the  
13 considerations to keep Cheney accessible and  
14 usable in all circumstances?

15 A. Yes. As a part of our water resources it is  
16 important that Cheney stay available as the  
17 other water rights we have will not meet our  
18 base water demand in the City. Even during a  
19 normal year. So Cheney is very important every  
20 year and immensely more important during drought  
21 conditions.

22 Q. In your modeling, do you also adjust different  
23 assumptions on the blending of the water  
24 resources from Cheney and the Equus Beds?

25 A. I will speak a little bit to the model that was

1 given me by High Country by John Winchester, who  
2 testified to that earlier. When that model was  
3 given to me there was no adjustment of the  
4 proportion of the water resources taken from  
5 either Cheney, Equus, or the surface water  
6 sources during the model droughts that had been  
7 done to date, at the time that model was given  
8 to me.

9 With his support, and through months of  
10 interaction, I made modifications to code that  
11 allowed for the model to make changes as drought  
12 progressed, and Cheney was depleted, that less  
13 use of Cheney was made and more of the aquifer.  
14 For example, the upper 80% of Cheney might be, I  
15 am sorry, I will converse this, invert this a  
16 little bit. For example, the upper 10% of the  
17 resources available to us with Cheney would be  
18 utilized at a rate of four to one. Four parts  
19 of Cheney to one part Equus Beds aquifer. As  
20 Cheney depletes, as the drought proceeds, that  
21 gets adjusted and goes back to more of a 60|40  
22 blend. If Cheney were to deplete any further it  
23 gets to be equal. And that's sort of coding.  
24 The specifics I can get in to, if necessary.

25 Q. Basically as you have less volume in Cheney to

1 work with, you are having to commensurately take  
2 more water from the Equus Beds because the  
3 City's demand is what it is?

4 A. Yes.

5 Q. And you mentioned that Mr. Winchester had worked  
6 with you for a period of weeks, and that he  
7 reviewed your modifications. Did Mr. Winchester  
8 also provide training to you for the use of the  
9 MODSIM DSS model?

10 A. In person, no. Over the phone and via E-mail,  
11 yes.

12 Q. And did you also, at times, work with the two  
13 people that he had trained in person when you  
14 were doing modeling with that MODSIM DSS?

15 A. Yes.

16 Q. What are the basic assumptions of the modeling  
17 you did for the proposal?

18 A. Well, I think the first and most important is  
19 the projected demand during the drought that I  
20 was attempting to model. Those demands were, as  
21 I have indicated in my expert report, accepted  
22 from the 2013 demand study, I don't know if  
23 that's an exhibit yet or not. I am sorry, it  
24 is. It's Exhibit 1. The demand study by SAIC  
25 establishes a demand for the year 2060 and that

1 has been utilized for all of the work done by  
2 John during the time of his work with the model.  
3 I think he even alludes to that model or  
4 references that work.

5 Then those demands, as projected out at  
6 that future date, were adjusted during the  
7 drought simulation to reflect that, in fact,  
8 demanding our users to cut their use. So the  
9 model, modifications that I made also reflected  
10 that change of conditions. That our users are  
11 cutting their daily demand by the, I am not  
12 certain, the numerical values are cited in the  
13 drought response plan and I could refer to those  
14 at some point, if needed.

15 Q. Let's look at section 2.2 in the proposal.  
16 What's the subject matter addressed in that  
17 section, Mr. Macey?

18 A. It's the future raw water demand assessment that  
19 I spoke to.

20 Q. So is that section of the proposal, is it based  
21 on your work product?

22 A. That's correct. I am sorry, let me evaluate  
23 that first. It cites the SAIC and PEC  
24 projections, the scenarios, the recommendations  
25 to go with the medium growth. I will concur

1 with the thought that the City believes the  
2 medium growth productions may be further reduced  
3 by utilizing conservation measures; so, yes, to  
4 that portion can be attributed to me.

5 Q. Did you review those 2013 demand assumptions  
6 that the SAIC study to determine whether you  
7 needed to make changes for purposes of what you  
8 were doing?

9 A. Yes, I did review them.

10 Q. And did you conclude that you needed to make any  
11 changes or adjustments to their demand  
12 projections to account for the three years that  
13 had passed?

14 A. No.

15 Q. And in your modeling, not simply within the  
16 context of the drought scenario, did you make  
17 any more general assumptions<sup>1</sup>, about  
18 conservation both in normal times and in drought  
19 times, and the affect that conservation over  
20 time might have on a water demand?

21 A. Well, in our strategic plan it was delineated  
22 that we would continue to, as policy, adhere to  
23 a .35% annual reduction over time. So that  
24 future demand that was laid out by SAIC was  
25 modified to match that. I am sorry if I didn't

1 say that earlier.

2 Q. As we heard in Mr. Henry's testimony, at least  
3 in the period that he was looking at in his  
4 testimony, we did a little bit better than the  
5 .35 target on conservation on that year?

6 A. Yes.

7 Q. What are the specific types of conservation  
8 efforts that you took into account?

9 A. The specific types of conservation?

10 Q. The conservation efforts of the city, if you  
11 could describe those for us.

12 A. Well, there's future reuse that is, that has  
13 been contemplated. There are continued annual  
14 investments in to the conservation plans. Those  
15 really were not a part of my work, but the  
16 numerical outcome of those efforts were.

17 Q. I think we already admitted in one of the  
18 exhibits the strategic plan document from the  
19 purple binder, just in case, would you go to the  
20 purple binder to the strategic plan document.

21 A. Okay.

22 Q. And actually I think the title may be water  
23 master plan, the document that I may be thinking  
24 of. I am sorry, it is strategic plan in the  
25 purple binder.

1 A. (Witness reviews documents).

2 Q. Looking at the pages there from 28 to 31 can you  
3 describe what they are?

4 A. Yes, I am sorry, 28 at the bottom there is a  
5 section that starts water supply. It continues  
6 to discuss.

7 MR. STUCKY: Excuse me, we don't have,  
8 I am not sure of the page, Exhibit 9, City's  
9 original Exhibit 9? Is that what we are  
10 referring to?

11 THE HEARING OFFICER: Is it that  
12 (indicating)?

13 MR. McLEOD: Yes. Yes, it is, thank  
14 you.

15 MR. STUCKY: Thank you.

16 BY MR. McLEOD:

17 Q. Okay.

18 A. You asked me a question of what this is. I  
19 think I can identify, I can identify some of the  
20 components. Again, it reiterates the concern  
21 for 1% drought, the annual conservation  
22 estimation or plan for .35%, our drought  
23 protection goal for 2060. It contemplates the  
24 other water supply options that were considered  
25 as well as compares the 1% drought with and

1 without those new supplies considered and  
2 additional information graphically.

3 Q. And just to clean up from my moment of  
4 confusion, that is the document that we  
5 previously had admitted as City's 9; is that  
6 correct?

7 A. Yes.

8 Q. Exhibit 9?

9 A. That's correct.

10 Q. If you would turn to section 2.3 in the  
11 proposal.

12 A. Okay.

13 Q. Can you explain your contributions to the  
14 modeling presented in that section of the  
15 proposal?

16 A. Well, again, it discusses the MODSIM DSS, the  
17 drought model that was given by John Winchester.  
18 My contributions were the implementation of the  
19 future demand as adjusted for planned  
20 conservation. And that results in future  
21 projected demand of 81,690 acre feet in 2060. I  
22 don't think it speaks directly to the changing  
23 resource apportionment. But my modeling also  
24 accommodates the limitations on the water  
25 rights, so if within the one year the water

1 right for Equus or Cheney hits its peak it's cut  
2 off for the remainder of that year.

3 That was an additional modification I  
4 made to the model so that the water rights were  
5 established that had been established are  
6 implemented. And then also similar application  
7 with the ASR credits. If ASR credits are used  
8 they are capped in their annual quantity and  
9 their rate. That modification was implemented  
10 by me. The initial stage of Cheney I think is  
11 misstated here. All my modeling for this  
12 drought was with the initial condition of Cheney  
13 of 100%.

14 Q. And what does it, what does the typo suggest  
15 instead?

16 A. It says 110% flow.

17 Q. So the correction would be of that 110 to 100%?

18 A. Yes. I limited the ASR credits to a maximum of  
19 60,000. Actually I kind of worked the other  
20 direction to minimize that number. The local  
21 well field described here as the E&S well field  
22 is not considered a firm source during drought.  
23 It was utilized as a source whenever there was  
24 water in the Arkansas River in town, those  
25 portions of the model were exercised and the,

1 and so that could be quantified. But it was a  
2 minimal amount.

3 The Bentley reserve, similarly,  
4 whenever there was stream flow available in the  
5 Bentley reserve field the model capitalized in  
6 that surface water supply. Again, it was  
7 drought, so there wasn't a lot.

8 The hydrological components, those were  
9 utilized as established by John in the model  
10 already, stream flow as he built them. As he  
11 constructed them. And I would say that the  
12 table 2.3, which I assume you consider to be  
13 part of section 2.3, those numerical values for  
14 the City demand the apportionment to the aquifer  
15 in Cheney are correct. However, I, again, I  
16 can't justify that number in the final row of  
17 that chart. I don't believe that's  
18 representative of calculations I did.

19 MR. STUCKY: Could the witness clarify  
20 which final number.

21 A. Go up. No, sorry. Down. Cheney % percent of  
22 conservation pool, again my model started with  
23 hundred percent full, and that first column is  
24 intended to represent a 12 month average,  
25 assumption is the pool would not be 110% of

1 starting, long term average would not be 110%,  
2 so I am starting at 100%, that first column  
3 doesn't represent reality, but the rest of the  
4 numbers, like I said, I can't justify; but the  
5 remainder of that table that is in alignment  
6 with the work that I did.

7 Q. Mr. Macey, when you ran modeling for the drought  
8 scenario at what point did your modeling show  
9 index levels declining below the 1993 levels in  
10 the drought?

11 A. That varied by the index cell, but that was a  
12 different model you are referring to. And that  
13 is work done by another consultant.

14 Q. Okay. Would that be Mr. Clement's work?

15 A. Yes. Amongst others.

16 Q. Were modifications that you made to the MODSIM  
17 DSS model, for purposes of your work, peer  
18 reviewed?

19 A. Yes.

20 Q. And by whom?

21 A. John Winchester from High Country Hydrology,  
22 Burns & McDonnell similarly. And then  
23 additionally I reached out to the user net of  
24 the software at Colorado State and interchanged  
25 modeling program changes with them to try to

1 diagnose why something wasn't working.

2 I would also list further on that  
3 chart, I wanted to point out, I just noticed on  
4 figure 2. Daniel, could you pull that up? On  
5 this graphic right here, I think this quantifies  
6 my statement that my modeling started with the  
7 initial pool of Cheney at 100%. As you can see  
8 there it starts at 167,000 acre feet and then  
9 declines from there.

10 This graphic similarly shows heavy use  
11 of the Cheney resource in the first couple of  
12 years of drought. And then as we enter in to  
13 the second and third year you can see that line  
14 flat lines. And that's because it came as the  
15 product of the model's change of resources at  
16 that point in time. I am sorry, I wanted to  
17 back up on that.

18 Q. Thank you. That's actually helpful. Were any  
19 points of clarification anticipated after the  
20 proposal was submitted?

21 A. I would assume, yes. That was the interaction.  
22 To set this up, I started working with GMD2  
23 early 2016, and interacting with them, showing  
24 my preliminary work for this model and  
25 preliminary model from the MODSIM model, which I

1           wasn't an expert at, but I was learning, that  
2           showed those concerns and quantified those  
3           concerns. And through that process I was  
4           establishing a working relationship figuring we  
5           were going towards something we could agree to  
6           that represented the conditions of the aquifer.  
7           Reasonable assumptions the City is making so  
8           that eventually this process could take place.  
9           And then, so, yes.

10                         With that as a preface, the assumption  
11           was, as this proposal went out in its multiple  
12           different generations, yes, we would continue to  
13           see refinement.

14   Q.    The figure 2 that you referred to, does that  
15           show that in the 1% drought, as you modeled the  
16           scenario using both credits and reductions of  
17           demand, you could get to the end without  
18           depletion of Cheney Reservoir?

19   A.    Yes. You could see the graphic doesn't go, that  
20           the Cheney Reservoir storage doesn't drop below  
21           60, 62,000 acre feet.

22   Q.    Were the demand projections that you referred  
23           to, were they also evaluated in section 3 of the  
24           2016 water master plan?

25   A.    I assisted in the creation of that document, Deb

1 Aoy and I worked with Burns & McDonnell during  
2 that document. Has that been submitted?

3 Q. That document is part of Exhibit 1, I believe,  
4 let me check. Actually I think it has not yet  
5 been.

6 (City Exhibit City 22 was marked for  
7 identification by the Reporter.)

8 THE HEARING OFFICER: What document is  
9 that?

10 MR. McLEOD: The water master plan in  
11 the white binder behind the tab that says water  
12 master plan.

13 MR. ADRIAN: Is it a portion of the  
14 proposal?

15 MR. McLEOD: It is not. It's a  
16 separate document.

17 BY MR. McLEOD:

18 Q. Mr. Macey, could you identify the document that  
19 has been marked as City 22?

20 A. Yes, sir, that's the 2016 Water Master Plan as  
21 generated by Burns & McDonnell.

22 Q. And if you would turn to section 3 of the water  
23 master plan, actually going by page first to  
24 Page 3-6 within the plan.

25 A. Okay.

1 Q. Sections 3.6.2 and sections 3.6.3, explain the  
2 information that's set forth there.

3 A. This is part of the Burns & McDonnell  
4 implementation of future water projection. It  
5 is kind of a subcomponent of their projection.  
6 I can elucidate further on this document, if  
7 needed, if that is appropriate.

8 Q. Please go ahead.

9 A. For context, and it's discussed elsewhere in  
10 here in the section 3.6.6, the document Page  
11 3-8, they go on to state effectively that the  
12 2013 water demand assessments were referenced  
13 and that their projections correspond with what  
14 I utilize, which is the 2013 medium growth  
15 production from that study. The 2013 growth  
16 study was based on a population growth pattern.

17 This particular projection prepared by  
18 Burns & McDonnell, utilized that as a comparison  
19 and, however, prepared a projection based on  
20 meter numbers and anticipating that the engine  
21 of economic growth in Wichita was the additional  
22 residential spread, if you want to call it that,  
23 of the City, as represented by that meter growth  
24 or meter addition pattern. Also informed by  
25 anticipated industrial growth and other users as

1 elucidated further in the document.

2 I wanted to include this as an exhibit  
3 due to the fact that it prepares, it presents a  
4 comparative, and to me it checked the work that  
5 I had been using in my own work, and independent  
6 evaluations of the trends that I had seen. And  
7 I believe there was a question the other day,  
8 yesterday, about those projections being  
9 inaccurate. I would point out that at the time  
10 this projections were made Wichita was growing  
11 at a rate of 1 to 1.2% percent per annum, and in  
12 the last eight years, Wichita, I want it get  
13 this right, in the last eight years Wichita has  
14 experienced a total of 1.8%. So considerable  
15 flat lining. And it's borne out by this report.  
16 Which, further, if you would turn to figure  
17 3.10.

18 Q. What is that graphic depicting, Mr. Macey?

19 A. We have two different parameters presented here.  
20 The lower set of information is the average  
21 daily water use in million gallons per day. And  
22 the upper group of lines is associated with the  
23 peak, the daily peak, as represented  
24 historically and projected out over time.

25 Q. There is also a table 3-6 that represents

1 information in tabular form. Would you turn to  
2 that table?

3 A. Yes, sir.

4 Q. And what is the presentation in that table?

5 A. It goes in to the various detail in those  
6 projected years. This is essentially the source  
7 data of the graphic I just alluded to. And it  
8 goes in to the detail on the future growth  
9 anticipated in residential and commercial use,  
10 retail and wholesale, average and peak day. And  
11 those projections on the last column of, last  
12 two columns on the right are the, as I said, the  
13 data presented on this, on the projection  
14 graphic you alluded to do earlier.

15 I just simply wanted to quickly comment  
16 that, as you may have seen from that graphic I  
17 laid out, that the City's master plan document  
18 is really only looking out to about 25 years.  
19 So in the short-term we have very close data, we  
20 have very good data on how things are going to  
21 go. But when you are reaching out to 2060, as  
22 we are here, and as they have done previously,  
23 we have to consider that long term goal as well  
24 as our immediate need.

25 Q. Based on the data that's presented in this

1 document, do you believe that the demand used in  
2 the MODSIM DSS are appropriate?

3 A. That the demand utilized by me in the MODSIM  
4 DSS?

5 Q. Yes.

6 A. Yes.

7 MR. STUCKY: I will object. Just a  
8 moment ago what I heard from the testimony to be  
9 was Mr. Macey was not an expert on the MODSIM  
10 DSS model. I believe that was his testimony  
11 just a moment ago.

12 MR. McLEOD: I don't recall that.

13 A. I think he may be misinterpreting a statement  
14 that I was trying to make. I was alluding to a  
15 secondary model which has been the one utilized  
16 by Burns & McDonnell, which is the Equus Beds  
17 groundwater model. I am certainly not an expert  
18 in that and I would have said that. Nor am I,  
19 what I would consider an expert in MODSIM,  
20 however, my experience with multiple years of  
21 project development and interaction with the  
22 software, I consider myself a near expert, but  
23 certainly not an expert.

24 THE HEARING OFFICER: Does that resolve  
25 that for you?

1 MR. STUCKY: That's the testimony I  
2 heard. So, yes, same objection.

3 MR. McLEOD: I would say, even though  
4 the witness doesn't think of himself as an  
5 expert for purposes of the expert opinion rules,  
6 the familiarity he has described, the experience  
7 he has described with this model, in fact, make  
8 him an expert for evidentiary purposes. And I  
9 ask that he be accepted as such for purposes of  
10 testifying for the modeling work that he did and  
11 the demand of projection work that he did.

12 THE HEARING OFFICER: Could you repeat  
13 the question that you initially asked?

14 MR. McLEOD: I asked Mr. Macey whether  
15 he interprets the data shown in the document  
16 exhibit before us, as showing that the demands  
17 that he used in his MODSIM modeling were  
18 appropriate.

19 THE HEARING OFFICER: As showing what  
20 he used in the model is appropriate?

21 MR. McLEOD: Right. It's more of a  
22 question about his demand projection work than  
23 it is about the MODSIM model as well, at that  
24 point.

25 THE HEARING OFFICER: Does that help

1 resolve your objection at all?

2 MR. STUCKY: I am actually perhaps more  
3 confused now, as far as what the question is.

4 THE HEARING OFFICER: I took the  
5 question, and please correct me if I am wrong,  
6 but I took the question fundamentally to say did  
7 you, does the witness believe his work was  
8 appropriate.

9 MR. McLEOD: Fundamentally does the  
10 witness believe that the demand figures that he  
11 used in modeling were appropriate demand  
12 figures.

13 MR. STUCKY: The modeling he did was  
14 based made on MODSIM modeling, and that was the  
15 basis for the objection, that he has indicated  
16 he is not an expert in that regard.

17 MR. McLEOD: I don't think the  
18 objection is actually addressed to the question.

19 THE HEARING OFFICER: I am going to  
20 allow this because I think what it's asking for  
21 is, is does the witness believe that his work  
22 and application of the model was appropriate; is  
23 that right?

24 MR. McLEOD: Yes.

25 THE HEARING OFFICER: Not a greater

1 question about the validity of the model. So I  
2 am going to allow it.

3 BY MR. McLEOD:

4 Q. Mr. Macey, in your expert disclosure you had  
5 included a reference to the exhibit aquifer  
6 profiles. Do you know which one of the binders  
7 that's in?

8 A. Yes. Lime. Let me make sure. Fourth tab from  
9 the back. It's orange.

10 MR. McLEOD: Before I do anything with  
11 that I offer for admission City's Exhibit 22,  
12 which I don't think we have admitted yet.

13 MR. STUCKY: No objection.

14 THE HEARING OFFICER: Okay. City 22  
15 will be admitted. Where are we now?

16 MR. McLEOD: Lime binder.

17 (City Exhibit 23 was marked for  
18 identification by the Reporter.)

19 BY MR. McLEOD:

20 Q. Mr. Macey, what's this document that has been  
21 marked as city 23?

22 A. This is a series of maps and cross-sectional  
23 displays of the aquifer levels and the, at the  
24 identified corridors, if you go to the first  
25 page of the exhibits, the first page is just a

1 general overhead map of the Equus Beds well  
2 field area and this is a simple GIS  
3 representation of data to show where we are in  
4 the world. The various lines, blue, red, green  
5 and dash represent cross sections of that  
6 aquifer, of that area of the aquifer area, I am  
7 sorry, that area of the aquifer.

8 So if I were to examine cross section  
9 A, that's actually the next page. And what this  
10 represents is as you go from with west to east,  
11 across the well field area you have five known  
12 locations where the lithology is identified, and  
13 the aquifer levels, at various points in time,  
14 are represented.

15 This was work that was generated by  
16 Burns & McDonnell in approximately the year 2000  
17 and I found it to be a useful graphic.

18 Q. Did you have any role in the actual preparation  
19 of the work?

20 A. This work, yes, I have submitted. The dashed  
21 line on that profile, and all the subsequent  
22 ones, represent the outcome of the proposed  
23 aquifer minimum levels, as delineated by Burns &  
24 McDonnell. So Burns & McDonnell's index level  
25 datum were represented at their point in space

1 on this profile.

2 So to reiterate then, these profiles,  
3 AA, BB, CC, throughout put that reference, we  
4 have the aquifer levels at 1940, 1993, 1998 and  
5 the additional line which is dashed, which is my  
6 work, is the interpolative elevation between the  
7 proposed index levels.

8 Q. In the course of that work did you consult with  
9 Burns & McDonnell to have them peer review or  
10 review your work?

11 A. I have submitted this for review.

12 MR. McLEOD: I offer City 23 for  
13 admission.

14 THE HEARING OFFICER: Any objections?

15 MR. STUCKY: May we have just one  
16 moment? Off the record.

17 (A short off-the-record discussion  
18 was held at this time.)

19 MR. STUCKY: Back on the record. I  
20 would allow it to be admitted but only for the  
21 purpose of allowing Mr. Macey to testify to the  
22 one line that he helped add to this document.  
23 And any further use or admission of it would  
24 have to be subject to further foundation made at  
25 a later time.

1 MR. McLEOD: We'll admit it, if there  
2 are no other objections, subject to those  
3 limitations.

4 THE HEARING OFFICER: Okay. So subject  
5 to the one limitation Mr. Stucky described City  
6 23 is admitted.

7 BY MR. McLEOD:

8 Q. Mr. Macey, I think earlier in the hearing there  
9 was an exhibit, a graphic exhibit that had been  
10 modified from a Kansas Geological Survey graphic  
11 and I am thinking that was City Exhibit 8. And  
12 that's in the lime binder, Mr. Macey.

13 A. I have it, sir.

14 Q. And foundational questions came up because of  
15 the witness who was on the stand that was first  
16 discussed didn't really know the particulars of  
17 where that graphic came from. What can you tell  
18 us about that, where the graphic came from and  
19 who provided it?

20 A. Mike Jacobs, with the City, provided this. It  
21 was in our records. The original file that was  
22 transmitted to him by the U.S. Geological  
23 Survey.

24 MR. STUCKY: May I approach the  
25 witness, we are still trying to find the

1 document.

2 A. It's the orange tab in the lime binder. It is  
3 in front of the green tab. Third one in the  
4 back. This one (indicating).

5 MR. STUCKY: I was looking up on the  
6 screen and that confused me. I was looking on  
7 the screen and that confused us. Okay. We are  
8 clear.

9 A. We are still speaking of this graph  
10 (indicating).

11 MR. STUCKY: On the record we are  
12 referring to Exhibit 8; is that correct?

13 THE HEARING OFFICER: Yes.

14 A. The original Excel file was transmitted to Mike  
15 Jacobs in an E-mail from U.S. Geological Survey  
16 Mike subsequently added our water use data to  
17 the last part of that file to represent the far  
18 right of the lines in the columns, the far right  
19 of the lines presented there. I think he also  
20 added the column data from data that was already  
21 in the worksheet. Again, this was a U.S.  
22 Geological Survey worksheet that was shared with  
23 us. And it would represent our in-house  
24 abilities to represent the data.

25 Q. So to make sure we are clear for the record, the

1 data that was actually added to that by city  
2 staff was what, what part of the data showing  
3 the graph?

4 A. The data for the City's water usage, for  
5 groundwater municipal use inside the city, I am  
6 sorry, the central city, Wichita well field  
7 area, and total groundwater use inside that same  
8 area.

9 Q. For what period?

10 A. I believe it would have probably have been just  
11 the columns for the data for 2014 and 2015.

12 Q. And if we were to compare this with the graphic  
13 in the publication that's referenced below the  
14 graph, were there more lines and legends on the  
15 graph that the Kansas Geological Survey  
16 published?

17 A. Yes.

18 Q. And did they remove those lines in the virginal  
19 sense of the City or did someone on the city  
20 staff remove those lines?

21 A. I can't speak to that.

22 Q. What were the lines and legends that were pulled  
23 off?

24 A. They were additional representations for water  
25 use by non municipal users, by irrigators, those

1 are identified as separate lines on the same  
2 graphic and also from the same data inside the  
3 worksheet.

4 Q. And other than the far right where Mike Jacobs  
5 added some information to update, are the two  
6 black lines shown on that graph identical with  
7 the ones that were in the published version?

8 MR. STUCKY: I am sorry, are we talking  
9 about two solid black lines? Or are we talking  
10 about --

11 MR. McLEOD: The dotted and the solid  
12 black lines.

13 BY MR. McLEOD:

14 Q. Were those both in the published graphic?

15 A. Prior to the data added for 2014 and 2015, yes.

16 Q. So all but perhaps those last two bars would  
17 have been in the original graphic?

18 A. Yes.

19 Q. And the main changes to pull out the red lines  
20 that showed usage that was in the study area,  
21 but outside the central well field; is that  
22 correct?

23 A. Yes. And this file is still available to me, if  
24 necessary.

25 MR. McLEOD: With that additional

1 information I hope that cleared up where that  
2 information is and where the various source came  
3 from.

4 BY MR. McLEOD:

5 Q. To be sure we are clear for the record, I think  
6 there may have been some confusion up to this  
7 point, what were you doing with the MODSIM DSS  
8 model versus what Burns & McDonnell was doing  
9 with the MODFLOW groundwater model?

10 A. I was working with the MODSIM model the various  
11 resources that were available to us during that  
12 represented 1% drought. Balancing the Cheney  
13 and the Equus and the other resources.  
14 Utilizing those at different, at different  
15 proportions, utilizing them at different stages  
16 of Cheney, at different demands at different  
17 starting elevations of Cheney at different  
18 starting elevations of the aquifer. I counted  
19 over 150 iterations of that modeling effort. In  
20 addition to the exercise of trying to identify  
21 which portions of \$421 million project should be  
22 constructed for our most benefit from the ASR.  
23 In that effort I identified additional projects  
24 that could be considered, implemented those in  
25 the model, ran the model in the different

1 scenarios. But for the purpose of this proposal  
2 it was strictly limited to the 2060 projection  
3 of the City demand with the implemented drought  
4 responses and limiting the ASR credits to  
5 quantity identified, so we could identify what  
6 amounts were used and when.

7 Q. So basically your modeling is showing the  
8 interrelationship and the interaction of the  
9 city resources, including those credits, with  
10 the assumed environmental conditions that are  
11 being developed; and in contrast to that, what  
12 was Burns & McDonnell doing in their modeling  
13 generally?

14 A. The modeling undertaken by Burns & McDonnell  
15 utilizing the portion of the water resources  
16 that were taken from the aquifer. It was done  
17 in the MODFLOW model, which is the USGS model,  
18 that I am not expert in.

19 Q. And, for example, so to help relate this maybe a  
20 little better, the tabular material that's  
21 showing the allocation of resources between  
22 Cheney and the Equus Beds, are those numbers  
23 being drawn from your work?

24 A. Yes.

25 MR. McLEOD: I don't have further

1 questions for the witness.

2 THE HEARING OFFICER: Mr. Oleen.

3 MR. OLEEN: Yes, I have some questions.

4

5 CROSS EXAMINATION

6 BY MR. OLEEN:

7 Q. Mr. Macey, if I understand your testimony  
8 correctly, well, tell me if I understand your  
9 testimony correctly, you had involvement in  
10 creating in the proposal, which is City's  
11 Exhibit 1, in the black binder, you had  
12 involvement in creating the model simulation  
13 results that are depicted in table 2-3; is that  
14 correct?

15 A. Correct.

16 Q. What about the data that's depicted in table 2-5  
17 of this same proposal? Do you also have  
18 involvement in creating that table?

19 A. No.

20 Q. Okay.

21 A. Other than the source data for this, it would  
22 have been from my original work.

23 Q. Well, looking at table 2-5, do you recall during  
24 Mr. Pajor's testimony when we are looking at the  
25 row that says City of Wichita ASR credit

1 pumping, (AF)?

2 A. Yes.

3 Q. And the column five in that row?

4 A. Yes.

5 Q. That figure there that I believe Mr. Pajor  
6 suspected might be a typo, do you have an  
7 opinion on that number or not?

8 A. Well, in drought year five, from my original  
9 work, the demand was 56,579. And for Equus Beds  
10 well field in the ASR in acre feet. And the  
11 issue of concern was that the -- that that --  
12 that was -- can you reiterate where the error  
13 was?

14 Q. Sure, I just want to make sure that I  
15 understand, and that DWR understands, how to  
16 read the two rows that are right next to each  
17 other. One row, which is titled, Equus Beds WF  
18 & ASR (AF) and below that, City of Wichita ASR  
19 Credit Pumping (AF).

20 A. I am sorry, there is some detail here that isn't  
21 presented in that particular year, and others,  
22 there were waters taken from the Bentley reserve  
23 well field that are enumerated in that 56,579.  
24 And I think another, another person will be  
25 giving testimony to elaborate on that, but that

1           56,579 contains resources from the Bentley well  
2           field, in addition to the 40,000 feet from the  
3           ASR.

4       Q.    Right.  And it is my understanding in the row  
5           titled total EBWF, et cetera, that that's a  
6           combination of both the 40,000 annual, quote,  
7           native water rights, plus to the extent there is  
8           any excess over 40,000, that excess is recharge  
9           credits?

10     A.    I think that was, that would, that could be  
11           reasonably interpreted from that indicator  
12           there, but I believe that it also does contain  
13           those rights that I just described on the  
14           Bentley well field.

15     Q.    Well, I will ask it one more time and then I  
16           will maybe drop it.

17                        I just thought that any time in the row  
18           where it says total EBWF, if the number is in  
19           excess of 40,000 then the remainder after  
20           subtracting 40,000 is the number of anticipated  
21           recharge credits that would be used?

22     A.    I think that's a reasonable assumption.

23     Q.    If that assumption is reasonable, then I wanted  
24           to know if my math was incorrect, or if it was a  
25           typo, because when you subtract 40,000 from the

1 figure 56,579 you do not get 15,552.

2 A. It's obviously a typo.

3 Q. Okay. Thank you. Both table 2-3, well, let me  
4 back up. At the top of Page 2-5 of the  
5 proposal, do you see where there is a bullet  
6 point that says Updated Outcome-Based Goals?

7 THE HEARING OFFICER: I am sorry, where  
8 are you?

9 MR. OLEEN: Page 2-5 of the proposal.

10 BY MR. OLEEN:

11 Q. At the top there is a bullet point that says  
12 Updated Outcome-Based Goals?

13 A. Page 2-5?

14 Q. Section 2.3.

15 A. Yes.

16 Q. Do you see that bullet point?

17 A. Yes.

18 Q. Last bullet, utilize 40,000 AF per year from  
19 EBWF prior to use of ASR recharge credits. Do  
20 you see that?

21 A. Yes, sir.

22 Q. Isn't it true that other city officials have  
23 said that under this proposal they would always  
24 be utilizing the 40,000 acre feet of native  
25 water rights before withdrawing any recharge

1 credits in any year of a drought; is that  
2 correct?

3 A. That would be the direction it would take, yes.

4 Q. And I just wanted to confirm that that  
5 statement, I can assume, is reflected in table  
6 2-3 and 2-5?

7 A. That was the intent.

8 Q. Thank you. Now, I want to turn to figures 10  
9 and 11 of the proposal. They are maps of the  
10 entire well field; is that correct?

11 A. Identifying the cells, yes.

12 Q. I just want to make sure that I understand what  
13 figure 10 is showing compared to figure 11. Can  
14 you explain the differences in those two figures  
15 for me, please.

16 A. Well, I know that other persons will make  
17 testimony on these; but I can. I did not  
18 participate in their creation, but I can  
19 identify what it is. The first of the figures  
20 is the figure 10 is the end of the drought  
21 simulated condition as identified at the end of  
22 stress period 8. The elevation information was  
23 translated in to the resultant estimated aquifer  
24 saturated thickness and a percentage. And the  
25 second one is --

1 Q. And if I may interrupt you, thank you. If I  
2 understand figure 10 correctly, that does not  
3 necessarily reflect that each index cell level  
4 at the end of the eight year period, the actual  
5 water level as dropped down to the proposed new  
6 levels that the City is asking for as part of  
7 this proposal?

8 A. Correct.

9 Q. But now turning to figure 11, I am thinking  
10 that's what figure 11 might actually show. And  
11 that's what I would like you to confirm for me.

12 A. That is my understanding, yes.

13 MR. STUCKY: I will object to this line  
14 of questioning. I promise I am trying to allow  
15 latitude in this regard, but my objection is  
16 twofold. Number one, it's outside of the scope  
17 of his expert report. And if you review his  
18 expert report, as far as what he is expert on,  
19 this isn't included within the sections that he  
20 has indicated he is an expert on, number one.

21 And number two, these charts are based  
22 on MODSIM modeling that was performed by others  
23 with Burns & McDonnell and were not performed by  
24 this witness. So I think at best that those  
25 questions be left to the individuals who

1 actually performed this work.

2 MR. OLEEN: If there is another city  
3 witness that's going to be able to testify to  
4 this, I will be happy to repeat every one of my  
5 questions for Mr. Stucky's benefit with a  
6 different witness.

7 THE HEARING OFFICER: Mr. McLeod, will  
8 there be another witness to testify about the  
9 creation?

10 MR. McLEOD: There would be another  
11 witness who can, but I would like to point out  
12 DWR is in cross examination here, and DWR did  
13 not serve any witness disclosure for this  
14 witness. DWR, in the scope of cross, is not  
15 bound by what was disclosed or not disclosed by  
16 the City's expert disclosure for the witness.  
17 The scope allowed in cross examination is  
18 exceptionally broad, and the objection is  
19 inappropriate when addressed to this questions  
20 raised in cross examination.

21 THE HEARING OFFICER: I seem to find it  
22 reasonable someone testifying as to what these  
23 figures mean, and were intended to mean, be  
24 someone that's familiar with their creation. So  
25 I don't think that request is unreasonable. If

1           this information, or these figures, were used by  
2           this witness and in the course of his work, that  
3           would be different.

4                     Mr. Macey, did you use these figures in  
5           the course of your work?

6     A.    No.

7                     THE HEARING OFFICER:   Okay.  I think in  
8           this particular instance I have given a lot of  
9           latitude, and I intend to do so, but I think in  
10          terms of interpreting what these particular  
11          figures mean is best left to a more qualified  
12          witness.  So I will sustain the objection.

13                    MR. OLEEN:  No further questions.  
14          Thank you.

15                    THE HEARING OFFICER:  Mr. Stucky.

16                    MR. STUCKY:  Would the audience like a  
17          lunch break before I start my questioning?

18                    THE HEARING OFFICER:  That's probably a  
19          very reasonable suggestion.  It is almost 12:40  
20          let's take a break until 1:45.

21                    (REPORTER'S NOTE:  At this time,  
22          12:37 p.m., a lunch recess was taken, after  
23          which, 1:44 p.m., the following proceedings were  
24          held:)

25                    THE HEARING OFFICER:  Back on the

1 record. It's 1:45 and, Mr. Stucky, I believe  
2 that you were up.

3

4 CROSS EXAMINATION

5 BY MR. STUCKY:

6 Q. Mr. Macey, just for clarification, do you have  
7 any education or training in computer  
8 programming?

9 A. Yes.

10 Q. What is that training?

11 A. University courses in programmable languages.

12 Q. Did you have a degree in computer programming?

13 A. No.

14 Q. Do you have a degree in hydro geology?

15 A. No.

16 Q. Do you have a degree in hydrology?

17 A. No.

18 Q. A few moments ago you indicated that you helped  
19 to make some predictions for future growth of  
20 the City of Wichita. Do you recall that line of  
21 questioning?

22 A. I did not make those predictions, those were  
23 others' predictions that I utilized in the  
24 model.

25 Q. So if I were to ask you questions about how

1           those predictions were made you wouldn't be able  
2           to answer those predictions?

3       A.    I could read those documents as well as you can,  
4           that's about it.

5       Q.    So the answer is?

6       A.    I can't elucidate on their development.

7       Q.    And as far as answering questions about past  
8           projections with regard to the City of Wichita  
9           on its growth?  Could you answer those  
10          questions?

11      A.    No.

12      Q.    You spoke to, well, there was a graph that was  
13           put out on the board that showed different  
14           levels of growth within the City.  There was low  
15           growth, medium growth and high growth within the  
16           city.

17      A.    Yes.

18      Q.    Can you tell me, if you know, or have an opinion  
19           on this, how one quantifies what is considered  
20           low growth, what's considered medium growth and  
21           what's considered high growth.  How is that  
22           quantified?

23      A.    In that document that was delineated.

24      Q.    Do you have any knowledge or expertise on making  
25           those predictions or projections?

1 A. No.

2 Q. Do you have any testimony, sitting here today,  
3 whether or not medium growth was the suitable  
4 projection to use?

5 A. The recommendation from the report was that that  
6 was the most likely. And the, I believe,  
7 counsel's guidance in the strategic plan  
8 informed me, and the process moved forward to  
9 utilize that medium growth projection.

10 Q. As far as why a medium growth determinant was  
11 used, you don't have an opinion as far as why  
12 that was used; is that correct, other than what  
13 you were told by others?

14 A. Other than it being recommended as the most  
15 likely outcome.

16 Q. You didn't perform any personal analysis to try  
17 to determine if that was a suitable growth  
18 model; is that correct?

19 A. For purposes of my work I found it to be  
20 suitable.

21 Q. As far as the basis for how that medium growth  
22 projection was calculated, you didn't do any of  
23 that work?

24 A. No.

25 Q. You indicated that as you were working on the

1 MODSIM model to try to determine projections in  
2 needs of water that you made some changes, I  
3 believe you said to some of the inputs, is that  
4 what you said?

5 A. As necessary for the assumptions for the  
6 demands, and as well as for the changes in the  
7 programming I described for the water plumes, et  
8 cetera.

9 Q. So the changes, specifically that you made to  
10 the programming were to allow for changes within  
11 the water demand of Cheney and changes within  
12 the water demand as far as what's taken from the  
13 Equus Beds? Is that the changes that you made?

14 A. Actually I could better characterize. The  
15 process that was built by Mr. Winchester was an  
16 iterative import/export from the model to Excel,  
17 back and forth. I automated that process so  
18 that those, those parameter changes, those blend  
19 changes were made as a part of the programming,  
20 as opposed to hands-on error prone manipulative  
21 process. And so those substantial changes were  
22 made to be automatic.

23 Q. How did you know when you made those modeling  
24 changes you did it correctly?

25 A. Those model parameter changes were with Mr.

1 Winchester and he tested them.

2 Q. I think you indicated that your training by Mr.  
3 Winchester was over the phone and also by virtue  
4 of an E-mail. Is that what your testimony was?

5 A. That's correct.

6 Q. Can you tell me what constituted the phone  
7 training?

8 A. I would describe to him the task that I was  
9 trying to achieve and how I would go about it  
10 and he would provide guidance.

11 Q. I guess my question is, was there more than one  
12 call?

13 A. Oh, yes.

14 Q. Do you know how many?

15 A. No.

16 Q. Just to clarify, as far as whether or not MODSIM  
17 itself is a suitable model for the projections  
18 made by the City, you are not an expert on that  
19 subject; is that correct?

20 A. No. But Mr. Winchester made the recommendation  
21 that it was the preferred of several, and I  
22 believe that is in his resource documents I  
23 shared as exhibits.

24 Q. Although you were able to put some inputs in to  
25 MODSIM, you also, I think you testified you also

1 would not characterize yourself as an expert as  
2 far as the ins and outs of how MODSIM works, is  
3 that a true statement as well?

4 A. I did not program it beyond the allowances made  
5 by the developers. The program, the basic  
6 program itself, is a stand alone and the changes  
7 made are a side, or subroutine, that as he  
8 described in his testimony interacts with the  
9 aquifer levels and provides flows to streams and  
10 streams come back to the aquifer, many of those  
11 calculations are happening outside of the model  
12 proper. As effectively subroutines and math  
13 that is augmented. And to the extent that I  
14 understand that part of programming, I would say  
15 that I am knowledgeable about that, but I am by  
16 no means an expert on it.

17 Q. Let's flip to Exhibit 22, which was the water  
18 master plan.

19 A. Can you remind me where that is?

20 Q. The individual to my right that has two working  
21 arms is trying to find it.

22 MR. STUCKY: Mr. McLeod, do you recall?

23 MR. McLEOD: I believe it is in the  
24 white binder.

25 A. Yes, sir.

1 Q. Am I correct in understanding with respect to  
2 this water master plan you didn't actually  
3 perform any of the analysis yourself that's  
4 included in this water master plan?

5 A. I provided feedback to the developer.

6 Q. But as far as helping to write this master plan  
7 itself, did you help write it?

8 A. No. I provided feedback to the developer.

9 Q. There are a number of calculations that are  
10 included in this water master plan, did you  
11 personally make any of those calculations?

12 A. No, sir.

13 Q. A moment ago you spoke as to some of the  
14 conclusions in that water master plan, did you  
15 help to write those conclusions?

16 A. No. But I understand the reason that I was  
17 speaking to those conclusions is, I guess for  
18 context as a comparative against the resource  
19 that I was utilizing, that's the only reason I  
20 was providing that commentary.

21 Q. You testified to figure 3.10 in this water  
22 master plan, and within that figure there is  
23 some different growth projections for the city.  
24 There is a green line that shows low growth,  
25 there is a yellow line that depicts medium

1 growth and there is a purple line that depicts  
2 high growth in that chart; is that correct?

3 A. Yes, sir.

4 Q. And as far as an analysis to determine whether  
5 or not the City's best fit, which one of those  
6 growth patterns you didn't do those  
7 determinations, correct?

8 A. Actually those were presented as comparative  
9 against the originator's work, I don't know  
10 anything beyond that.

11 Q. So you are not certain of how those growth  
12 projections were determined; is that correct?

13 A. Other than understanding it from this book  
14 (indicating).

15 Q. Now, I want you to flip to him 3.6.6 of this  
16 document, which is the conclusion of the  
17 document. It's on Page 3-8 --

18 A. Yes.

19 Q. -- of that document.

20 A. Yes, sir.

21 Q. Can you read for me the first sentence of the  
22 second full paragraph on that page.

23 A. The City also developed an average water demand  
24 projection as part of the 2015 Water Resources  
25 Plan and includes a 1% drought and targets of

1 .35% conservation effort through year 2060.

2 Q. That says it's the City's goal to basically  
3 implement a drought target of a third of a  
4 percent, or a conservation target of a third of  
5 a percent; is that correct?

6 A. I think that that should be elucidated that  
7 should be an annual goal. The intent is to say  
8 annually, not .35 over the course of the years  
9 2060, that should be expressed as an annual  
10 goal.

11 Q. So with respect to it being an annual goal, the  
12 City's goal was only to promote conservation  
13 annually by about a third of a percent, is that  
14 what this document purports to show?

15 A. Yes, and I can elucidate on the total count on  
16 that, if you want.

17 Q. You indicated a moment ago that population  
18 growth in the City is perhaps going to flat line  
19 at some point in the future?

20 A. Actually I said it has flat lined.

21 Q. I misspoke. Yes, you said the last eight years  
22 1% growth and now essentially flat lined?

23 A. That's what I would consider that it has flat  
24 lined as per previous indicators.

25 Q. Do you have any reason to believe that that

1 growth projection would change?

2 A. I would anticipate and engineer a project to  
3 include that it will change to a greater number.

4 Q. Now, how long, and this may have been stated,  
5 how long have you worked for the City?

6 A. Since 2014.

7 Q. And where did you work prior to 2014?

8 A. I had 20 years of experience as a municipal  
9 engineer in Lewiston, Idaho.

10 Q. In Idaho. So prior to 2014 did you work on any  
11 projects involving the Equus Beds aquifer?

12 A. No, sir.

13 Q. Prior to 2014, did you have any involvement in  
14 the ASR Phase II project?

15 A. No.

16 Q. Prior to 2014 did you have, had you not done any  
17 work on behalf of the City of Wichita or any  
18 work involving any aquifer in the State of  
19 Kansas?

20 A. That would be entertaining if I had; but, no, I  
21 haven't.

22 Q. I would ask if you would flip to me to Exhibit  
23 23. Exhibit 23 was that map.

24 A. My map? The one I made?

25 THE HEARING OFFICER: This one

1 (indicating)?

2 Q. A moment ago as Mr. McLeod walked you through  
3 this document, you indicated that there was a  
4 line on this document that you helped to create,  
5 was that a true statement?

6 A. I created the GIS representation previously  
7 created by Burns & McDonnell that was in the  
8 form of this sheet right here, electronically  
9 it's the content that I created.

10 Q. To clarify, as far as it is depicted on this  
11 Exhibit 23, did you do the work prior to that  
12 Exhibit 23 being created?

13 A. No.

14 Q. So, in other words, and I am strictly looking at  
15 the date of this document, which is on the  
16 second page, and if you will, with me, if you  
17 would look, on the left-hand portion of that  
18 second page, there is a date.

19 A. Yes, 2000.

20 Q. You would agree that the date of that document  
21 is 2000?

22 A. Uh-huh.

23 Q. So just to clarify the record, so I am clear,  
24 there was some testimony perhaps about whether  
25 or not you helped to create a line on this

1 document. In other words, you didn't actually  
2 help to create the line, and any of the analysis  
3 that was depicted on this particular document;  
4 is that correct?

5 A. I would differ with that opinion. If you will  
6 look at a comparable graphic from the section  
7 previous in the exhibit book ASR concept,  
8 Exhibit 7, the second page of the various maps  
9 that are in the back, that is the original Burns  
10 & McDonnell document. And the comparable one  
11 that you demonstrated shows the additional line  
12 added to the original document (indicating).

13 Q. So at a later time you added a line then to the  
14 original document?

15 A. That's correct.

16 Q. Is that your testimony?

17 A. That is correct.

18 Q. Okay. I was unclear. Do you know if there were  
19 other modifications made to that document other  
20 than that line?

21 A. These are edits that I made, I don't know what  
22 anyone else did.

23 Q. Did anyone peer review the work you did?

24 A. As it was provided to Burns & McDonnell.

25 Q. As I heard the testimony to be was that you

1 submitted this for review --

2 A. Yes.

3 Q. -- to Burns & McDonnell, I think was your exact  
4 language; is that correct?

5 A. That may be, yes.

6 Q. And you indicated it was submitted for review,  
7 but what I didn't hear was the result from it  
8 being reviewed from Burns & McDonnell. Did you  
9 hear anything back from them?

10 A. Not that I recall. I indicated it was a  
11 resource that I felt was useful for  
12 demonstrating the levels that are existing  
13 historically and proposed, and I made it  
14 available to them as a resource, should they  
15 want to. And I similarly want to, so that's why  
16 I submitted it.

17 Q. So you would at least agree with me, and again,  
18 the full process matters, you would at least  
19 agree with me that the actual peer review  
20 process was not completed in that regard; is  
21 that correct?

22 A. If you would consider the return response to be  
23 the complete peer review, I would agree.

24 Q. If you could flip with me to the City's Exhibit  
25 8.

1 A. (Witness reviews documents). I don't know what  
2 that is.

3 Q. It is --

4 A. Water use I believe is what it is called.

5 THE HEARING OFFICER: This one  
6 (indicating)?

7 Q. With respect to Exhibit 8 there are two lines  
8 depicted on that document; is that correct?

9 A. Yes, sir.

10 Q. And tell me what that top line is.

11 A. I am assuming the dash line total groundwater  
12 use inside the central Wichita well field area.

13 Q. And what is the line below it?

14 A. Groundwater municipal use inside the central  
15 Wichita well field area.

16 Q. So the top line represents total water use  
17 within the Equus Beds well field; is that  
18 correct?

19 A. Yes.

20 Q. And the second line just depicts water use by  
21 the City; is that right?

22 A. That -- I think that could be assumed, yes.

23 Q. Would you acknowledge the fact that, first of  
24 all, that the City is using the bulk of the  
25 water within the Equus Beds well field?

1 A. I think that's a misstatement. It's the central  
2 well field study area, which would be our well  
3 field boundary. As a whole I would say that's  
4 not correct.

5 Q. Within what's depicted in that particular  
6 graphic?

7 A. This graphic defined to the central well field  
8 area, yes, it's over 50 percent historically.

9 Q. Does that map also show, at least to a rough  
10 degree --

11 MR. STUCKY: May I approach the  
12 witness?

13 THE HEARING OFFICER: Yes.

14 BY MR. STUCKY:

15 Q. Now, I am not asking for an exact science, but  
16 would you agree that at least roughly the two  
17 lines depicted in Exhibit 8 parallel each other  
18 at least to some degree?

19 A. Yes, since it is the Wichita well field area,  
20 and it is a portion of groundwater used, where  
21 we have the majority of the water rights, and it  
22 would make sense then that the majority of the  
23 use would be our use.

24 Q. So the users of everybody within this area  
25 depicted on the graph roughly parallels the use

1 of the City of Wichita, is that what you would  
2 say?

3 A. Uh-huh. That would only indicate that the long  
4 term non municipal use is fairly stable.

5 Q. You said that you used MODSIM to see differences  
6 in Cheney Reservoir and the Equus Beds aquifer,  
7 and in doing so you utilized 150 different  
8 iterations, was that your testimony?

9 A. Probably more than that, but yes. But actually,  
10 I don't understand your question, to see water  
11 levels.

12 Q. Tell me what you used the iterations for.

13 A. Multiple uses. Multiple starting conditions of  
14 the two main water resources, to test the  
15 sensitivity of the model to those conditions.  
16 And then iteratively with eight or so different  
17 components of an expanded ASR project, one, two,  
18 three, all the way to eight of those, assembled  
19 as a group, to arrive at the best most operable  
20 combination outcomes for the ASR creation, ASR  
21 credit creation in the drought -- I am sorry,  
22 not in the drought -- but the outcomes of  
23 through the drought using those different  
24 components. And that's the different  
25 iterations. I guess the point being, that I

1           have run it more than once or twice.

2       Q.    So the multiple uses, for example, what are  
3           those multiple uses?

4       A.    That is enabling different links in the diagram.  
5            You could see the links, the connecting lines  
6            between components, those are either disabled or  
7            enabled based on whether a component is in use.  
8            Different flow capacities of different  
9            components are changed, but those are again just  
10           iterations of me playing with the model.

11      Q.    And what were all the different components?

12      A.    Of the various components of additional ASR  
13            implementation there were, the diversion wells  
14            were in there, the proposed diversion wells were  
15            in there, the additional recharge recovery wells  
16            were in there as an alternative, an additional  
17            expansion of the ASR point proper to a 60 MG  
18            capacity, additional, what we call side stream  
19            storage, which would allow the flow events of  
20            the river to be captured and extended for the  
21            use in the ASR project. I probably missed a  
22            few. But those enumerate the different  
23            components that were considered.

24      Q.    Now, as you went through and were playing with  
25            the different components and trying to change

1 the components to create different results, were  
2 there components of the model that you  
3 determined should have been included in the  
4 model? Or would have been best, that you wished  
5 were included in the model? Let me ask it that  
6 way.

7 A. I don't think I understand your question.

8 Q. I guess my question is, you said there were  
9 different components of this model that could be  
10 changed. Were there categories that as, you  
11 looked at those different components, there were  
12 additional categories you wished would have been  
13 part of the model that you could have changed?

14 A. There were innumerable amounts of components  
15 that I would have added, but I didn't have time  
16 nor the inclination.

17 Q. Well, if you had all the time in the world on  
18 your hands, what would be some of those  
19 additional components you would have added to  
20 the model if you could or change?

21 A. That's strictly preliminary work, nothing I  
22 would disclose at this point.

23 Q. Well, I am asking you in a hearing, as far as,  
24 in a hearing under oath, what these additional  
25 changes would have been. I think that's

1 something you could testify to.

2 A. Well, I mean, there were allowances for a  
3 certain number of diversion wells that could be  
4 considered under the proposal. I would have  
5 considered an expansion of that array of wells.  
6 There was an expansion of the, what was  
7 described as the local well field, local well  
8 field downtown. There were the additional  
9 proposed considerable consideration of wells  
10 along the floodway that were not modeled that I  
11 think we would capitalize on. Again, it's all  
12 ideas.

13 Q. You indicated that as you were running the  
14 different iterations you were trying to create  
15 an optimal situation or an optimal result, was  
16 that your term?

17 A. Yes.

18 Q. Tell me what you meant by optimal? In other  
19 words, optimal for who?

20 A. I would consider that achieving the goal of  
21 having the water resources to stay out of stage  
22 3 drought, and minimizing the use of  
23 groundwater, to be my optimal goal. And to that  
24 end, as I described and maximized the usage of  
25 Cheney as the model that would allow me, without

1           depleting it to the extent that it would no  
2           longer be useful. Again, to minimize the use of  
3           the groundwater, and that would mean in the form  
4           of ASR credits for those usages beyond 40,000  
5           acre feet.

6       Q. All right. I ask that you flip to Exhibit 1,  
7           which is the City's proposal, it is in the black  
8           notebook. A moment ago you testified with  
9           respect to section 2.3, which happens to be on  
10          Page 2-3 of the City's proposal.

11       A. Uh-huh.

12       Q. And I just want to be clear that your testimony,  
13           at least as it relates to the 110%, which is  
14           identified on this page, your testimony was that  
15           that was just an error; is that correct?

16       A. I am not certain why that value is there, that's  
17           correct. As I demonstrated, I mentioned the  
18           graph on the next page shows the initial  
19           condition as 167,000 acre feet which is hundred  
20           percent full.

21       Q. And also table 2-3 it starts, Cheney Reservoir  
22           at 110% at the start of that modeling as well.  
23           Is that at least what the table shows?

24       A. Yes, the table indicates an error, to me an  
25           error.

1 Q. Now, if I were to tell you that throughout this  
2 proposal that number of 110% surfaces for the  
3 starting point for Cheney Reservoir. Is it your  
4 testimony that that 110% throughout this entire  
5 proposal is an error?

6 A. It seems that's true.

7 Q. I think you told, you said that as a model is  
8 being looked at there is always points of  
9 clarification, I think was your terminology; is  
10 that right?

11 A. I may have said that.

12 Q. And I think you also said that it is expected to  
13 see refinery, is that your language as well?

14 A. Yes, I think so.

15 Q. Do you know whether or not anyone from the  
16 District, or anyone from the Division of Water  
17 Resources, asked the City how that 110% for  
18 Cheney Reservoir was determined in advance of  
19 this hearing?

20 A. Yes, I do.

21 Q. And how did the City respond to that  
22 questioning?

23 A. I don't recall that response, but I know that a  
24 response was made.

25 Q. I ask that we flip, you flip in your, in City's

1 notebook in the black notebook to the Proposal  
2 Correspondence. And to start out, well, if you  
3 could flip to Page 69.

4 A. (Witness complies). Yes, sir.

5 Q. On Page 69, does that appear to be a letter that  
6 was written by David Barfield, who would be the  
7 chief engineer of the Division of Water  
8 Resources to the City of Wichita?

9 A. Uh-huh, yes.

10 Q. And do you have any reason to doubt that this  
11 was the official letter, or at least a  
12 representation of the official letter, that was  
13 sent to the City of Wichita?

14 A. No, I don't.

15 MR. STUCKY: I would like to mark this  
16 as the City's Exhibit, I think we are ready for  
17 24.

18 (City Exhibit 24 was marked for  
19 identification by the Reporter.)

20 THE HEARING OFFICER: Any objections?

21 MR. McLEOD: No objection.

22 THE HEARING OFFICER: City's 24 will be  
23 admitted.

24 MR. STUCKY: I would ask to move to  
25 admit this in to evidence.

1 THE HEARING OFFICER: We did.

2 MR. STUCKY: Sorry, it's been a long  
3 day.

4 BY MR. STUCKY:

5 Q. I will do it from memory, I gave my copy away.  
6 If you could turn to Page 71 of that letter.

7 A. Yes, sir.

8 Q. And at the top of Page 71 there is a question  
9 that is asked by the chief engineer to the City  
10 of Wichita; is that correct?

11 A. It's a bullet point, it's not really phrased in  
12 the form of a question.

13 Q. Could you read for me that bullet point from the  
14 chief engineer of the Division of Water  
15 Resources?

16 A. We assume that the 110% assumption for Cheney is  
17 based on the reservoir achieving this level in  
18 non drought years. If so, you might state this  
19 basis.

20 Q. At least as it relates to this letter the chief  
21 engineer of the Division of Water Resources  
22 asked how this 110% was determined; is that  
23 correct?

24 A. That appears to be, yes.

25 Q. And the date of this letter, if you flip to Page

1           69, the very first page of that letter, what is  
2           the date of this letter?

3           A.    September 18th, 2017.

4           Q.    So if the City was asked how this 110% was  
5           determined clear back in 2017, do you have any  
6           response or rationale for why that percentage  
7           wasn't corrected in the proposal?

8           A.    I can't explain why it wasn't corrected.

9           Q.    I would ask that you also flip in the City's  
10          Exhibit notebook to Page 65.

11          A.    (Witness complies).

12                   MR. STUCKY:  I would like to mark this  
13                   as City's Exhibit 25.

14                           (City Exhibit 25 was marked for  
15                           identification by the Reporter.)

16          Q.    I will hand you what has been marked as City's  
17                  Exhibit 25.  Do you recognize this document to  
18                  be an E-mail from Mr. Boese with the Equus Beds  
19                  Groundwater Management to the City of Wichita?

20          A.    To several people at City of Wichita.

21          Q.    Are you, in fact, one of recipients of that  
22                  E-mail?

23          A.    Yes, sir.

24          Q.    A question is asked by Mr. Boese, let me ask you  
25                  this, what's the date of that particular E-mail?

1 A. July 18 of 2017.

2 Q. Now, the question is asked by Mr. Boese in  
3 bullet Number 5 of this E-mail. Could you read  
4 that?

5 A. Why was Cheney started at 110% for the 1%  
6 drought simulation for the MODSIM DSS update?

7 Q. And as you are sitting here today do you know  
8 what the answer to Boese's question was?

9 A. It wasn't, first of all, it wasn't started in  
10 the actual simulation, this is a representation  
11 of the report, I am sorry, the proposal. And I  
12 was aware of this concern on Mr. Boese's behalf  
13 and it didn't get corrected.

14 Q. Are you aware or can you point to an E-mail as  
15 far as when Mr. Boese was answered with regard  
16 to that question?

17 A. I cannot.

18 Q. Do you know if anyone from the City ever  
19 responded to Mr. Boese's question in that  
20 regard?

21 A. I can't answer that. I don't have any idea.

22 Q. And so at least until prior to today, when we  
23 have learned that it's actually 100% instead of  
24 110%, at least for that two year period, we  
25 don't have any indication that the City made an

1 effort to explain that difference, is that a  
2 true statement?

3 A. The record wouldn't indicate that we did.

4 Q. Do you have any knowledge why not?

5 A. Other than two years of hearing processes that  
6 may have delayed the process somewhat.

7 Q. Well, you told me just a moment ago that you are  
8 expected to see refinement in modeling and there  
9 was supposed to be points of clarification, that  
10 was your testimony that I highlighted just a  
11 moment ago. If that is true wouldn't it be  
12 expected that one would interface with other  
13 constituents, and especially a manager, the  
14 groundwater management to help answer that  
15 question?

16 A. I would expect that cooperation on the  
17 groundwater model, yes.

18 Q. Now, I would ask that you flip to figure 2 on  
19 Page 26 of the City's proposal.

20 MR. STUCKY: And Exhibit 25 is admitted  
21 in to evidence; is that right?

22 THE HEARING OFFICER: I don't know that  
23 it was.

24 MR. STUCKY: I move to admit Exhibit 25  
25 in to evidence.

1 THE HEARING OFFICER: Any objections?

2 MR. McLEOD: Is Exhibit 25 the  
3 District's?

4 MR. STUCKY: It was the City's Exhibit  
5 25, just to make it numerically easier to  
6 follow.

7 MR. McLEOD: No objection.

8 THE HEARING OFFICER: City's 25 will be  
9 admitted.

10 BY MR. STUCKY:

11 Q. Now, on 2-6 on the City's proposal on figure 2  
12 it indicates that there was, you indicated that  
13 the starting point on that figure appears to be  
14 167,000 acre feet; is that correct?

15 A. Uh-huh.

16 Q. Did you help to derive this figure 2?

17 A. I created that figure and submitted it to Burns  
18 & McDonnell who incorporated it in to document.

19 Q. Would you personally have entered the figure of  
20 167,000 acre feet?

21 A. In the model, yes.

22 Q. I want to also clarify some testimony that I  
23 heard just a moment ago with respect to table  
24 2-5 on Page 2-10. Mr. Oleen was asking you some  
25 questions as far as what appeared to him, and I

1 think appears to a number of us, to be an error  
2 on this particular table. And the error being  
3 the number of 15,552. On column Number 5. Are  
4 you focused on that number?

5 A. Yes.

6 Q. And I think your testimony was that perhaps part  
7 of the reason that that number was different  
8 could be that it assumed that water would be  
9 pulled from the Bentley well field, was that  
10 your testimony?

11 A. That was conjecture on my part, but I do recall  
12 a conversation with Mr. Clement wherein he was  
13 creating this graphic, or this table, utilizing  
14 data that I provided to him. And I recall  
15 something to that extent, but the details I  
16 can't remember.

17 Q. But I want to clarify your testimony, you are  
18 not exactly sure if the variance in that figure  
19 is either, A, due to an error; or, B, due to the  
20 fact that it could be that water is accounted  
21 from the Bentley well field, is that a true  
22 statement?

23 A. I have no idea. I just assumed it was a typo.

24 Q. Now, if you could flip back to section 2.3 of  
25 the model, or of the model of the, I mean of the

1 proposal rather. Are you on that page?

2 A. Yes.

3 THE HEARING OFFICER: I am sorry, which  
4 page is this?

5 MR. STUCKY: Section 2.3 on Page 2-3.

6 BY MR. STUCKY:

7 Q. In that 1% drought simulation that you focused  
8 on, in bold, raw water resources include Cheney  
9 Reservoir. Do you see that in the document that  
10 I am reading?

11 A. Yes.

12 Q. And there are five bullet points underneath that  
13 section; is that right?

14 A. Uh-huh.

15 Q. Could you read the fifth bullet point for me.

16 A. Bentley reserve well field is not considered a  
17 firm source during drought due to limiting  
18 stream flow triggers and poor water quality  
19 during lowered Arkansas River flows.

20 Q. Do you know what is meant by the terminology,  
21 firm source, end quote?

22 A. Well, in terms of the modeling, my  
23 interpretation in the form of the modeling, I  
24 understand the firm source during droughts  
25 meaning, I believe, to present the case that

1 those wells are associated with surface water  
2 event, as in a river flow. And so, therefore,  
3 the rights that are associated with those events  
4 are not accessible to us during most drought  
5 events.

6 Q. On table 2-3 it says that the concentration pool  
7 for Cheney is based on a 12 month average.

8 A. Table 2-3?

9 Q. That's right. My question how was that 12 month  
10 average was determined?

11 A. Well, in my model a 12 month average was taken  
12 as a daily pool across the previous 365 modeled  
13 days, and that's the math. And then as time  
14 proceeded, then that 365 day period changed.

15 Q. And I would also like to ask you one additional  
16 question about figure 2. Just so I am clear in  
17 the testimony, I think you said something about  
18 the red line showing actual water use in Cheney  
19 Reservoir of 62,000 acre feet during a time of  
20 the drought, or something to that effect. What  
21 was your testimony?

22 A. What I was speaking to on this graphic is I was  
23 referring to changes in the water blends. So in  
24 the first year or two you can see Cheney being  
25 rapidly declining. And that's in large measure

1 in the first year because we are taking it at a  
2 greater portion. And then later on in the  
3 drought, IE, year four or six, those downward  
4 projections of the pool are flatter, meaning  
5 there is less being taken from the reservoir.  
6 And it was depleted to no less than 60,000 acre  
7 feet. That's the number that you have in your  
8 head.

9 Q. That clarifies it. You were looking at that  
10 blue line on there?

11 A. Yes, sir.

12 Q. Do you have any knowledge of whether or not  
13 anyone from the Equus Beds Groundwater  
14 Management District asked you to clarify how the  
15 error about the 15,562 acre feet?

16 A. I distinctly remember the E-mail.

17 Q. So, in other words, you do recall being asked,  
18 at least about a year and a half ago, about  
19 whether or not or how that error --

20 A. My understanding is we were in the hearing  
21 process so we weren't going to communicate. So  
22 there was no directive for me to do that.

23 Q. So if I were to tell you on April 12, 2018, Mr.  
24 Boese E-mailed the City and asked about that  
25 exact error in that table, you wouldn't have any

1 reason to disagree with that statement?

2 A. I have no disagreement.

3 Q. And your response is, at that point you didn't  
4 find it necessary for the City to communicate to  
5 that response?

6 A. I wouldn't say it wasn't necessary, ideally we  
7 could have.

8 Q. Well, the proposal was submitted on March 12,  
9 2018, would you agree with that date?

10 A. I am certain that's correct.

11 Q. And if Mr. Boese's E-mail came exactly one month  
12 later, at that point we weren't in this hearing  
13 process; is that right?

14 A. That may be. I don't understand necessarily  
15 where you are going.

16 Q. Well, I think you said the reason why there  
17 wasn't a response was because we were in this  
18 formal hearing process.

19 A. I think that was largely, yeah, we were trying  
20 to under take this effort, and I didn't want to  
21 muddy the water to add corrections to my  
22 consultants' effort.

23 MR. STUCKY: No further questions.

24 THE HEARING OFFICER: Ms. Wendling.

25 MR. OLEEN: May I, please.

1

2

RECROSS EXAMINATION

3

BY MR. OLEEN:

4

Q. Mr. Macey, I hope this will be the last  
5 discussion about the 110% typo, but I can't  
6 guarantee it. I just want to know, I think you  
7 said that throughout this proposal any time  
8 there is a reference to Cheney being a 110% full  
9 that's a typo and it should be 100%, is that  
10 right?

11

A. Typo might not be the correct characterization,  
12 it's a misuse, it's wrong in comparison to the  
13 modeling I did.

14

Q. So the modeling that you did that's reflected in  
15 this proposal, you actually used the 100%  
16 figure?

17

A. That's correct.

18

Q. And the fact that there is a typo, or the fact,  
19 whatever you want to call it, that there is the  
20 number of 110% with reference in here to Cheney,  
21 that doesn't affect any of the other data  
22 associated with Cheney, does it?

23

A. No. Nor, does it have an affect on the data  
24 provided to Burns & McDonnell for their work.

25

Q. So, for example, that table 2-3 in the proposal,

1 even though the bottom row starts in year one,  
2 but the reference to Cheney being 110% full, you  
3 explained that that's 100. The rest of the  
4 numbers in that table we can assume are correct?

5 A. I wouldn't make that assumption, no. I mean, on  
6 that row, definitely the row, but the remainder  
7 of it is correct.

8 Q. Okay. I just want to know, if the other  
9 percentages in the other years I can assume are  
10 correct --

11 A. I don't know that.

12 Q. Why don't you know that?

13 A. I didn't review it recently, so I don't recall.

14 MR. OLEEN: Nothing further.

15 THE HEARING OFFICER: Ms. Wendling.

16 MS. WENDLING: Yes.

17

18 CROSS EXAMINATION

19 BY MS. WENDLING:

20 Q. Mr. Macey, you mentioned that you looked at  
21 multiple different iterations using this model  
22 including different starting conditions?

23 A. Yes.

24 Q. Can you elaborate what different starting  
25 conditions you remember?

1 A. Specific to the aquifer? Or to Cheney?

2 Q. Let's start with the aquifer.

3 A. Various stages of depletion in terms of  
4 numerical values. The, as John testified to,  
5 it's treated like a big bowl of water, he didn't  
6 use those terms, but it's obviously not that,  
7 but then that parameter I set in the model  
8 informs loss to the river or conversely, losses  
9 from the river to the aquifer. Those different  
10 levels in terms of the numerical range that I  
11 tested? No, I don't recall, it's been quite  
12 awhile. But I did experiment with the different  
13 levels for the aquifer as represented in the  
14 model.

15 Q. And when you were doing that, and my language is  
16 probably wrong, but you were using different  
17 input files?

18 A. It's simply a set. It's an exact parameter  
19 that's in the interphase that I set as the  
20 initial stage of that resource. It's got so  
21 many thousand acre feet in it. And as I recall,  
22 it's not a direct correlation to the number that  
23 is shown in the USGS reports. It's a lesser  
24 number than that. I know I have the resources,  
25 it's just not in the exhibits for the detail.

1 Q. So, for example, would you have been able to use  
2 a starting condition as a 1998 aquifer level  
3 versus a 2001 aquifer level?

4 A. I don't know that I had that data at the time.  
5 It could easily be done. I may just do it for  
6 fun.

7 Q. But you don't recall if you looked at any other  
8 specific starting points based on actual  
9 conditions?

10 A. Right. That would be, I would say no, I did  
11 not.

12 Q. And with the various different projects, I think  
13 you called them components that you might have  
14 looked at, you did run scenarios incorporating  
15 those, some of those or all of those at various  
16 different iterations?

17 A. Yes.

18 Q. And that included the side stream storage?

19 A. Yes.

20 Q. Is that the same side stream storage that had  
21 been considered by the City as an alternative?

22 A. That's one of the identified parts of the  
23 structures that were considered in 2014 that was  
24 brought to the City's electorate.

25 Q. On the different iterations were you, did you

1           have discretion over which iterations you  
2           determined or did someone tell you which  
3           iterations to test?

4       A.    It was at my discretion.

5       Q.    How did you determine the best outcome? You  
6           mentioned how to use water from Cheney versus  
7           the aquifer, how did you decide when you found  
8           the right ratio?

9       A.    Well, I have, through the different iterations  
10           of my efforts, some models would go in to  
11           drought stage three or four. Others would have  
12           excessive use of ASR credits, I would say those  
13           would not be considered, those are too much of a  
14           risk because we may not accrue those excessive  
15           number of credits. The use of those credits  
16           then leave the opportunity for loss, greater  
17           loss in Cheney. Those are not optimal outcomes.  
18           So the optimal I thought was to use as much of  
19           the transient resource that is Cheney. And as  
20           little as possible of the aquifer resource,  
21           meaning credits and/or base rights, to mean the  
22           optimal outcome with the caveat with the optimal  
23           outcome, also not requiring our users to go  
24           beyond stage 2 drought restrictions.

25       Q.    Did you look at any other iterations going in to

1 stage 3 of the drought resources?

2 A. I had some that were resulting in that, yes.

3 Q. Do you recall those results?

4 A. You would have to be more specific about the  
5 outcome.

6 Q. Do you recall if going in to stage 3 reduced the  
7 number of credits?

8 A. Certainly it would. You are using less of that  
9 resource and you are providing less to your  
10 customers.

11 Q. You discussed finding a balance where you could  
12 use as much of Cheney without depleting it to a  
13 state where it was no longer useful.

14 A. Uh-huh.

15 Q. Am I characterizing that correctly?

16 A. Generally, yes.

17 Q. How did you come to the point Cheney was no  
18 longer useful?

19 A. Maybe that's a bad terminology on my part. You  
20 would try to avoid depleting Cheney to the point  
21 where you have less than some number of months  
22 of water available in that. I think I might  
23 have utilized a six-month supply as my bear  
24 minimum from Cheney. This is strictly from one  
25 of the many things I did, but utilizing that as

1 a bear minimum, as a buffer in case my model was  
2 wrong, I think is a responsible effort.

3 Q. But you were to determine what that buffer was,  
4 there wasn't a model or a formula approach to  
5 tell you the scientific buffer you need so that  
6 Cheney is not depleted?

7 A. No, that was strictly my work with the model and  
8 informing my managers this is the outcome of my  
9 effort and making them aware of what I am trying  
10 to do and receiving guidance. It was strictly  
11 my result, my effort.

12 Q. In regarding communication, were you instructed  
13 not to communicate during the hearing process?

14 A. No. Again, as I said, I did not want to throw a  
15 bunch more corrections in to somebody else's  
16 work until we were further along, and then it  
17 was the hearing process. So that was my  
18 thinking.

19 MS. WENDLING: No further questions.

20 THE HEARING OFFICER: Mr. McLeod.

21 MS. WENDLING: One second. Could I  
22 admit 26?

23 MR. STUCKY: I failed to admit Exhibit  
24 26, can I admit it.

25 THE HEARING OFFICER: That was the

1 E-mail from Mr. Boese.

2 MR. STUCKY: Yes. It was 101 and I  
3 believe I didn't admit it.

4 THE WITNESS: Which one?

5 MR. STUCKY: 101 of the City's  
6 correspondence. Another E-mail on the back. I  
7 am not sure that was formally admitted and  
8 that's what was being referenced.

9 THE HEARING OFFICER: That wasn't even  
10 marked, right?

11 MR. STUCKY: It wasn't marked, I am  
12 just cleaning up.

13 THE HEARING OFFICER: Any objection?

14 MR. OLEEN: Sorry, what are you wanting  
15 to mark?

16 MR. STUCKY: E-mail 101 of City's  
17 correspondence, as Exhibit 26, City's Exhibit 26  
18 is how I want to mark it. It was testified to.

19 THE WITNESS: And I think where we fell  
20 apart he didn't direct me to it.

21 MR. OLEEN: You mentioned it. I don't  
22 have a problem. I prefer it be showed to the  
23 witness.

24 MR. STUCKY: I will come back to it.  
25

1 REDIRECT EXAMINATION

2 BY MR. MCLEOD:

3 Q. Mr. Macey, the document that you sent to Burns &  
4 McDonnell for peer review and didn't hear back  
5 on, what you did there was basically plotting an  
6 elevation on a cross section, wasn't it?

7 A. Yes.

8 Q. Does your qualification as a professional  
9 engineer, in your opinion, make you capable of  
10 plotting an elevation on a cross section?

11 A. Certainly.

12 MR. MCLEOD: No further questions.

13

14 RECROSS EXAMINATION

15 BY MR. STUCKY:

16 Q. Could you flip with me under the City's  
17 correspondence to the document that is 101 in  
18 the City's correspondence? Does that appear to  
19 be the E-mail that we spoke about just a moment  
20 ago?

21 A. Yes, sir.

22 MR. STUCKY: I would like to move to  
23 mark that as City's Exhibit 26.

24 (City Exhibit 26 was marked for  
25 identification by the Reporter.)

1 THE HEARING OFFICER: Any objections to  
2 26 being admitted? Hearing none.

3 MR. McLEOD: Is there some duplex  
4 printed on that that needs to be addressed for  
5 clean up?

6 THE HEARING OFFICER: Yes.

7 MR. STUCKY: The back page we would  
8 agree is not part of what we are admitting.

9 MR. McLEOD: With the understanding  
10 it's not part of the E-mail, we don't have any  
11 objection to admitting it as an exhibit.

12 THE HEARING OFFICER: Page 101 and only  
13 Page 101, City's Exhibit 26, is admitted. Mr.  
14 Stucky.

15 MR. STUCKY: No further questions.

16 THE HEARING OFFICER: Are there any  
17 other questions for Mr. Macey? Hearing none,  
18 Mr. Macey, you may be excused.

19 THE WITNESS: Thank you.

20 THE HEARING OFFICER: Should we go to  
21 the next witness or take a short break?

22 MR. McLEOD: Does anybody need a short  
23 break?

24 THE HEARING OFFICER: No. Let's roll.

25 MR. McLEOD: Next call Daniel Clement.

1 DANIEL CLEMENT,  
2 was thereupon called as a witness herein, and  
3 after having first been duly sworn to testify to  
4 the truth, the whole truth and nothing but the  
5 truth, was examined and testified as follows:  
6

7 DIRECT EXAMINATION

8 BY MR. McLEOD:

9 Q. Please state your name for the record.

10 A. My name is Daniel Clement.

11 Q. Mr. Clement, do you have any post secondary  
12 university degrees?

13 A. I do have a bachelor of science degree from  
14 Kansas State University in geology.

15 Q. Do you have any professional licenses or  
16 registrations?

17 A. Yes, I am a licensed professional geologist in  
18 the State of Kansas.

19 Q. And where are you employed, Mr. Clement?

20 A. With Burns & McDonnell currently.

21 Q. What is your job title?

22 A. I am a hydro geologist.

23 Q. And what sorts of things generally do you do?

24 A. So we have a number of clients obviously in the  
25 industrial sector and municipal sector, my job

1 mostly entails water rights consulting, water  
2 rights evaluations, water supply planning, new  
3 well construction, new well siting, aquifer  
4 investigations, sustainability investigations,  
5 groundwater interaction, groundwater modeling  
6 are the things hydro geologists do.

7 Q. How long have you worked as a hydro geologist?

8 A. I will be going on, let's see here, it will be  
9 right at almost seven years with Burns &  
10 McDonnell, and a couple of years before that, so  
11 about ten years total.

12 Q. Looking in the lime notebook, Mr. Clement,  
13 behind the tab expert reports, and actually  
14 after the last report that's in there, where the  
15 CV and professional resumes are clipped. Do you  
16 find a copy of your CV or professional resume in  
17 there?

18 A. You said in the lime?

19 Q. Lime notebook.

20 A. Point me to it. It would save everybody some  
21 time.

22 MR. McLEOD: I will have the document  
23 marked by the reporter as City 27.

24 (City Exhibit City 27 was marked for  
25 identification by the Reporter.)

1 BY MR. McLEOD:

2 Q. What is that document?

3 A. This would be my resume or CV.

4 Q. Did you participate in the generation of this  
5 document?

6 A. Yes.

7 Q. How long ago was it generated?

8 A. It was before the proposal, I would assume.

9 Q. At the time that it was generated was it a true  
10 and accurate account of your relevant  
11 experience?

12 A. Yes.

13 Q. And what sorts of things have happened since  
14 that might require it to be updated?

15 A. I have a couple of other projects that might be  
16 relevant. I have done some work for the City of  
17 Olathe, and I have done work for the City of  
18 Hays' well field, groundwater modeling, I have a  
19 couple of other projects that may be applicable  
20 here.

21 Q. Can you give us a short description of each of  
22 those.

23 A. Sure. I will look at what's on here so I don't  
24 duplicate anything. I have do have one on here  
25 that would have been for another industrial

1 client that were looking at de watering for a  
2 CCR control permit essentially, what to do with  
3 whole combustibile residuals. So looking at how  
4 new groundwater pumping and changing the  
5 location of their well field would essentially  
6 de water that area that was of interest. And  
7 basically constructed a groundwater model for  
8 that program and different river elevations and  
9 similar packages as what we used for the USGS  
10 model. So that would be one example.

11 Another example would be an update for  
12 the City of Hays, there that's on the resume at  
13 least, the GMC5 model, the Big Bend model, we  
14 updated that model, at least the pumping  
15 conditions that were within it, made some  
16 modifications to it and ran that for the City's  
17 purpose.

18 The other one that comes to mind that  
19 doesn't appear to be on here, would be the City  
20 of Olathe that I mentioned. The construction of  
21 groundwater model. The purpose of that was to  
22 look at well-to-well interference, how  
23 individual vertical wells could essentially be  
24 spread out and not impact one another looking at  
25 interference drawdown to optimize that well

1 field.

2 MR. McLEOD: I offer the exhibit for  
3 admissions.

4 THE HEARING OFFICER: Any objections?

5 MR. STUCKY: No objections.

6 THE HEARING OFFICER: City 27 will be  
7 admitted.

8 BY MR. McLEOD:

9 Q. Mr. Clement, in the back binder where the City  
10 proposal appears, which has been previously  
11 admitted as City's Exhibit 1. Please go to  
12 table 2-4.

13 A. (Witness reviews documents). Okay. I have  
14 arrived at table 2-4.

15 Q. Can you please explain for us how you developed  
16 and selected the groundwater modeling variables  
17 to simulate the 1% drought described by Mr.  
18 Winchester.

19 A. Sure. Our goal, Burns & McDonnell's task was to  
20 take the USGS groundwater model and provide  
21 inputs to that model that would simulate the 1%  
22 drought. And I think, as John Winchester  
23 touched on earlier, in order for us to update  
24 the model, to provide inputs to the model, it  
25 take things like precipitation, it takes things

1           like stream gauge info in order to create the  
2           stress periods for those years. Well, the first  
3           thing we looked at from Mr. Winchester's work it  
4           looked like a period of the 1930s drought would  
5           be the drought we would want to include in our  
6           modeling simulation, if that makes sense.

7                        So the first thing we did was looked at  
8           what the available data was both within the  
9           existing USGS model and what we could create if  
10          those weren't in it. I believe the USGS  
11          contained periods of 1939 to 2008 in the  
12          transient simulation. So obviously we would be  
13          missing some of the years within the 1930s  
14          drought.

15                       The first thing I did was look at the  
16          available hydro geologic data and rebuild those  
17          years, specific for 1930. And what we  
18          immediately found is, quite simply, the  
19          available data wasn't there. So the number of  
20          the precipitation gauges was very, very limited  
21          around there and also the stream flow data, at  
22          least in accordance with the original model  
23          documentation wasn't available. So we had to  
24          look at developing alternative method using  
25          surrogate years or another method to develop our

1 stress period for creating 1% drought. That's  
2 basically what table 2 is.

3 So if you look there, and as Mr.  
4 Winchester testified earlier, we have the period  
5 that we are looking at from 1933 to 1940 that we  
6 were kind of targeting. And he did mention  
7 cumulative PDSIs, one of those indicators for  
8 total depth or in terms of what does it total up  
9 in terms of duration. So our goal was to match  
10 that. We looked at the available years. We  
11 downloaded data from NOAA, to get both six  
12 months PDSI and 12 month PDSI, those are listed  
13 in the table. And then we totaled those up to  
14 cumulative PDSI and compared it.

15 So you can see that the 1933 and 1940  
16 average for south central Kansas was around  
17 negative 2.64. That would be the first gray  
18 line row down at the bottom. And if we are  
19 looking at a six month value of that, an average  
20 of negative 2.7. The 1933 to 1940 cumulative  
21 would have been negative 24.09 for the 12 month  
22 annual, and then the six-month would have been  
23 negative 21.58.

24 So in other words, we were trying to  
25 target anywhere from negative 21 to negative

1 21.58, somewhere in that realm. So in order to  
2 do that, since we couldn't simply go get the  
3 data from 1930s and create model inputs for  
4 that, we had to look at, okay, are there other  
5 transient data available within the USGS model  
6 that has already been created. So over a period  
7 of 1939, all the way to 2008, and also  
8 subsequent updates from the accounting reports  
9 that had been done to that model, we actually  
10 had data from 2011 and 2012 for stress periods.

11 So we said, let's look at that and see  
12 how that totals up, if we could repeat those for  
13 essentially back-to-back, 2011 to '12, to create  
14 a total period of eight years, what would that  
15 look like in terms of cumulative PDSI. And  
16 that's what is shown there in the chart.

17 So that's how we developed our target  
18 years to simulate, and that's what is shown  
19 there in table 2-4, is 2011 and 2012 repeated  
20 basically to create a cumulative PDSI with the  
21 right target range for simulating a 1% drought.

22 Q. When you use the term stress period, Mr.  
23 Clement, is the stress period basically a year  
24 modeled in the drought model later?

25 A. Yes.

1 Q. On the 12 month and six-month PDSI figures, do  
2 those show up in the NOAA data as 12 month and  
3 six month seasonal figures?

4 A. I believe you would have to divide each one by  
5 12 and 6, accordingly in the accompanying  
6 attachment.

7 Q. Is the PDSI a concept that NOAA uses?

8 A. I believe it is, just because it is a six-month  
9 seasonal relative to the growing season. So  
10 they provide that in accompaniment in the 12  
11 year to provide some relative feedback on the  
12 growing season and the total year as a whole for  
13 a perspective.

14 Q. Do you know what six months they consider to be  
15 the growing season?

16 A. Off the top of my head, I don't recall.

17 Q. And if I am understanding correctly, when you  
18 talk about the 1930s drought, as Mr. Winchester  
19 had modeled it, you are looking at the  
20 cumulative PDSI that he derived for the entire  
21 drought period, and you are trying to find years  
22 that will sum up to that same cumulative PDSI,  
23 and 2011 and 2012 were the years that you found  
24 would do that?

25 A. Correct.

1 Q. If you would, flip back further in the proposal  
2 to table 2-5.

3 A. Okay.

4 Q. And first I believe that this is the table where  
5 we are having an issue with whether maybe there  
6 is a mathematical error in the table. Can you  
7 speak to that error, which I think is in column  
8 five.

9 A. Yes, sir. I think, so we are in model stress  
10 period 5 under the row of City of Wichita ASR  
11 Pumping (AF). So if you, well, the total Equus  
12 Beds in ASR that demand of 56,579 I believe that  
13 to be correct. I believe that City of Wichita  
14 ASR credit pumping in that row for stress period  
15 number 5, I believe is a typo.

16 Q. What do you believe is the correct figure for  
17 that box should be?

18 A. A delta, let's see, 16,579.

19 Q. So basically it would be the total Equus Beds  
20 well field in ASR acre feet number minus the  
21 40,000 acre feet?

22 A. That's correct. And actually it hits my brain,  
23 I recall, maybe it was after the first public  
24 information meeting, after the information what  
25 you submitted we found that typo. And I sent

1           that to GMD or DWR, to somebody. I believe that  
2           has already been addressed.

3       Q.    And let me back up and ask you as to the table  
4           2-4 question that I didn't ask you, did you  
5           generate that table 2-4?

6       A.    Yes.

7       Q.    And is the same true of this table 2-5?

8       A.    Yes.

9       Q.    And can you please explain for us how you  
10          developed the groundwater pumping values within  
11          the 1% drought groundwater model?

12      A.    Sure. So I will go by row-by-row here to make  
13          things simple. The future, and I will try to  
14          cover it call, I think it would be beneficial  
15          for everybody. So the first row is future  
16          demand planning year, so, in other words, 2060,  
17          2061. That would be the year that we are  
18          planning for the future. So the City is  
19          planning out through 2060. If you guys can  
20          imagine that as the first year that we would be  
21          simulating here in the table.

22                    So the stress periods in all the way  
23          through 10. Let's go to that next row,  
24          simulated hydrologic year. So we are simulating  
25          the things in that hydrologic year that we are

1 saying is 2060, we are going to say it was as  
2 dry as 2011. So things like precipitation,  
3 aquifer recharge stream flow, not manmade, this  
4 is what the climate is, and those contributions  
5 go in to the model according to 2011 and 2012  
6 and step through all the way through that row.  
7 Until you get over to, let's say, stress periods  
8 9 and 10 where we use two recovery periods. And  
9 2010 was a relatively wet period and that was  
10 the only thing that was asked to be in the model  
11 and two years of recovery.

12 So again, these are kind of  
13 representative, but also I will go down and  
14 cover all three real quick. Stream flows  
15 precipitation and recharge and  
16 evapotranspiration, or ET for short. Those were  
17 repeated, 2011 and 2012 accordingly. So the  
18 precipitation in the year 2011 and the first  
19 stress period. Same thing, we just varied the  
20 hydrologic cycle according to 2011, accordingly  
21 to stress periods.

22 So pumping would be the next one. So  
23 for other people, non city pumping, irrigation  
24 and industrial and other well pumping, we  
25 actually used the 2011 or 2012, DWR reported max

1 to the hydrologic year. So those would be DWR  
2 reported numbers. The only exception to that  
3 irrigation, it is modified slightly based on the  
4 type of irrigation system. All that was done in  
5 accordance with the USGS model documentation.

6 So if someone uses a center pivot that  
7 has a different efficiency, than let's say drip  
8 tape, that's accounted for. And some of that  
9 actually flows back to the aquifer. So that's a  
10 net pumping value that goes in to the model.

11 The next line is total Equus Beds well  
12 field and ASR demand. This would be total  
13 demand to the Equus Beds well field, if you want  
14 to think of it that way. Both the ASR credits  
15 and just the normal 40,000 acre feet, if it's  
16 required for demand. That comes from the City's  
17 MODSIM DSS model, so the City told basically  
18 told Burns & McDonnell, here's what we think  
19 we'll need under a 1% drought, we need you guys  
20 to run the model and see what it looks like in  
21 terms of water level changes, do we need to  
22 change the lower index levels. That was the  
23 purpose of that.

24 So the 34,202, those numbers would have  
25 come from the City's MODSIMS DSS runs to figure

1 out how much demand we wanted to place to the  
2 Equus Beds and ASR credits. So the next line,  
3 which we just corrected, that was the delta  
4 between the 40,000 acre feet and the City's  
5 native rights and ASR pumping credits. That's  
6 not cumulative, that is just showing the  
7 difference for the record.

8 And then Cheney Reservoir pumping, we  
9 don't simulate Cheney Reservoir within the USGS  
10 Equus Beds model, we just wanted to have it all  
11 summarized in one table. It also shows, because  
12 again, we thought it would be good to have it  
13 all in one table, the drought stage that the  
14 City would be in the drought response plan.

15 Again, it's just to have it all in one  
16 spot so we could see how the City's response  
17 plan is kicking in, and also changing demands  
18 that's being sent to the Equus Beds model. And  
19 then the conservation pool number, or percent of  
20 conservation pool, again, I think that 110% to  
21 be consistent what Scott put together based on  
22 what I saw. I think the 110% number is wrong,  
23 it's just a typo. We did do a number of runs  
24 with the City to look at the affects to be able  
25 to store additional water above conservation

1 pool. I believe there are some preliminary  
2 negotiations, but I think that number should be  
3 hundred percent. And those numbers would have  
4 been supplied by the City's MODSIMS DSS model.  
5 Again, we don't simulate Cheney Reservoir with  
6 the groundwater model. And then total demand  
7 essentially by the City is shown there at the  
8 bottom. So long way saying here's what's in  
9 table 2-5.

10 Q. So it would be that, that row City of Wichita  
11 ASR Credit Pumping by acre feet that would  
12 reflect what the City, based on its demand  
13 forecast would think it would need to draw in  
14 credits in each of those model stress periods;  
15 is that correct?

16 A. Correct.

17 Q. So none at all in the first year of the drought,  
18 5,651 acre feet in the second, and then in the  
19 third 19,907 acre feet, which that's pretty much  
20 going to be all the City can take with its  
21 limit; is that correct?

22 A. I believe that's correct.

23 Q. And in all the other years it's smaller than  
24 that 19,907. Why did we add recovery years?

25 A. I believe that was at the request of either GMD

1 or DWR. We wanted to see, number one, that the  
2 model didn't continue to illustrate that  
3 declines happened after pumping strategy were  
4 changed back to normal years. That was one  
5 check. And the other was to show that it did  
6 recover, and if it did recover, under let's say,  
7 slightly than wetter conditions, what would that  
8 look like.

9 Q. Mr. Clement, did you develop any maps or figures  
10 based on the model results to illustrate, and  
11 when I say model results, I mean the ones that  
12 you derived using the groundwater modeling?

13 A. Sure. So the way this worked is for at least  
14 the set up of the model and we can field through  
15 questions is, I set up the pumping and most of  
16 the inputs for the drought model run. I had  
17 another colleague run the model, just to be  
18 efficient with our time so that as we were doing  
19 iterations make sure I could develop, while not  
20 watching model run, just for licensing. And  
21 post processing, the generation of the figures  
22 would have been my role. So pre and post  
23 processing would have been my role in this. And  
24 the number of figures and maps, those are all  
25 being generated by me.

1 Q. Let me back up and ask this question. What was  
2 the groundwater model that you used to do the  
3 modeling of the drought periods?

4 A. It would have been the USGS Equus Beds  
5 groundwater model that was, and I don't remember  
6 the Scientific Investigations Report, but  
7 2013-5042, if it's burned in right, it would  
8 have been that groundwater model.

9 Q. Was that the same model Dr. Akhbari and Mr.  
10 DeAngelis were testifying about yesterday?

11 A. Yes.

12 Q. In the maps and figures in the proposal, do you  
13 have any that you did based on model results to  
14 illustrate simulated water level changes  
15 throughout the ASR project area?

16 A. Yes, we try to output every stress period to  
17 illustrate how things would change. We did that  
18 in a number of tables as well. So I believe  
19 starting with figure 5 through 8, at least, we  
20 showed different levels based on different  
21 stress periods to show how things were not only  
22 changing over time, over specific stress  
23 periods, but over space, too.

24 We also had, it looks like table 2-9  
25 provides a pretty decent summary model response

1 just for general geographic areas, if you would  
2 like to review that.

3 Q. Going to that table, 2-9.

4 A. Okay.

5 Q. Can you explain the values provided within the  
6 proposal in table 2-9.

7 A. Sure. This is our run using the model inputs we  
8 talked about previously. The stress periods are  
9 listed there at the top. So SP1 using 2011  
10 value and SP2 would be 2012 and repeat. So the  
11 first row, let's start there, the ASR basin  
12 storage area average water level starting  
13 conditions. Starting conditions I believe were  
14 based on 1998 groundwater level conditions. So  
15 what these columns are showing then is the  
16 departure from that initial condition. Year one  
17 we essentially had 1.8 feet of fall within the  
18 basin storage area, on average, all the way  
19 through, if we go to stress period, 8, roughly  
20 8.2 feet of drought across the entire basin  
21 storage area, from initial starting conditions.

22 The central well field storage area  
23 next line, 2.1 drop in the first year all the  
24 way through to stress period 8 where we see an  
25 11.6 drop on average within the central well

1 field storage area. The next lines are taking  
2 those specific geographic areas and using GIS to  
3 come up with saturated thickness within that  
4 area and then providing a relative full  
5 condition based on the predevelopment level and  
6 the level at which each interval ends up, each  
7 stress period.

8 Q. So when you talk about using GIS, is that the  
9 manner by which you would determine what the  
10 affect would be in a particular index cell or  
11 vicinity of a particular well?

12 A. So what GIS allows for post processing for all  
13 results. We also use a software called  
14 Groundwater Vistas. It's good for individual  
15 things but not for doing statistics. So we  
16 export the results from our modeling software,  
17 essentially GIS, to allow, for like you just  
18 said, processing of what happens over a  
19 geographic area of an index cell, for example,  
20 or basin storage area, for example, or central  
21 well field, for example; rather than going  
22 through each cell and come up with individual  
23 numbers that way.

24 Q. And so in, this table 2-9, this is based on the  
25 assumptions that are outlined in the earlier

1 table 2-5, these are the modeling results that  
2 follow from those assumptions?

3 A. Yes. Just making sure we have the table numbers  
4 correct, yes.

5 Q. So the table reflects the water level changes  
6 with the City pumping its base water rights, and  
7 then in the years where it needs credits, also  
8 pumping the credits that it needs?

9 A. That's correct.

10 Q. So some of the water level changes shown in the  
11 exhibit are from the City pumping its base water  
12 rights, while others would be, parts of others,  
13 would be from recovery of ASR credits; is that  
14 correct?

15 A. Yes.

16 THE HEARING OFFICER: I have a  
17 question. If I follow what you are saying,  
18 table 9 reflects the results of the line on  
19 table 2-5. So it is the total Equus Beds well  
20 field and ASR pumping?

21 A. Say that again.

22 THE HEARING OFFICER: In other words,  
23 if those quantities are pumped in those years,  
24 table 9 shows what would happen?

25 A. That's correct. With the addition of

1 agricultural pumping and industrial pumping  
2 included in those numbers. So we included other  
3 users on top of the City's pumping. So it will  
4 have ASR credit recovery, City of Wichita's  
5 normal base rights, ag pumping, industrial  
6 pumping, all of those would be reflected in  
7 these water level changes in the percent of full  
8 conditions represented in table 2-9. So the  
9 model input shown in 2-5, the stress periods  
10 correlate to the reaction of the aquifer in  
11 table 2-9.

12 THE HEARING OFFICER: Looking at table  
13 2-5, that same row that we are talking about,  
14 the total Equus Beds and ASR pumping, I think  
15 you said that the City provided those numbers.  
16 Are those numbers that were actually pumped in  
17 2011 and 2012?

18 A. No.

19 THE HEARING OFFICER: Did that change?

20 A. That's the theoretical number that the City  
21 believes that they would have to take out based  
22 on a projection through 2060. So in 2011 and  
23 2012, all of the other pumping was kept the  
24 same, so the reaction of irrigators in 2011 are  
25 represented, the reaction of industry and other

1 municipalities are represented in those stress  
2 periods that are listed here. But since we are  
3 talking about a theoretical, up to 2060, we  
4 said, okay, let's take the demand we think we'll  
5 need with ASR, and all the other things that's  
6 in the MODSIM DSS model, we had the demand for  
7 the Equus Beds, and ASR provided from the MODSIM  
8 DSS modeling incorporated that year.

9 We are assuming that the reaction of  
10 irrigators, and everyone else, would be the same  
11 as 2011. So the pumping that's shown in stress  
12 periods one through ten is the combination of  
13 kind of everybody doing what we anticipate they  
14 would do in 2060, including the City, if that  
15 makes sense.

16 THE HEARING OFFICER: So the only real  
17 anticipated changes factored in is the City's  
18 pumping?

19 A. Yes.

20 BY MR. McLEOD:

21 Q. And I think you clarified in that series of  
22 answers, Mr. Clement, that some of the water  
23 changes going in to the table there would  
24 actually be from the agricultural and industrial  
25 pumping as well?

1 A. Yes. That's also included in the water level  
2 drops and percent full conditions, yes.

3 Q. Below the table 2-9 there is a notation that you  
4 did hydrographs on individual index cells.  
5 Where in the proposal do those hydrographs for  
6 each of the index cells appear?

7 A. I believe that cites, I am reading here. We  
8 generate a hydro -- well, it looks like  
9 Attachment I.

10 Q. Let's go to that attachment.

11 A. I have arrived at Attachment I.

12 Q. And let's start with the first hydrograph. What  
13 index cell is that hydrograph? Well, let me  
14 back up and confirm. Were these also graphics  
15 that you generated?

16 A. Yes.

17 Q. And the first hydrograph in the set, what index  
18 cell is it for?

19 MR. STUCKY: Can we pause for just a  
20 moment. Tell us the page again.

21 A. We are in Attachment I, that I am looking at.  
22 And about, well, if we were referencing the  
23 first hydrograph, I would be on one, two, three,  
24 the fifth page.

25 BY MR. McLEOD:

1 Q. So, Mr. Clement, this hydrograph it appears to  
2 follow kind of a standard format where you are  
3 showing a set of things in this graphic format  
4 for each of the index cells. Can you walk us  
5 through what this graphic is doing, and what the  
6 different components of this graphic are  
7 showing.

8 A. Sure. I think it would be easier to start at  
9 the legend. So on the left side, IW1A and IW1C,  
10 two different colored lines there. So we  
11 exported from the model, from the upper layer of  
12 the model correlating to IW1A, and from the  
13 lower layer of the model at that location would  
14 represent IW1C. You can see that those lanes  
15 basically overlap one another. There is not  
16 much head difference between those two, at least  
17 not on this example. And we are plotting the  
18 elevation change through time. The right axis  
19 is a little bit different. Let's ignore that  
20 one for now. What we are showing, starting  
21 conditions, essentially all the way through  
22 ending conditions, how water levels is changing  
23 over time as predicted by the model for both the  
24 upper and lower aquifer, at the location of the  
25 index well on this instance on this hydrograph.

1           The purple bars that are vertical, represent the  
2           percent of predevelopment of the aquifer. And  
3           when I say predevelopment I mean pre 1930s, when  
4           we knew pumping occurred when the aquifer was as  
5           full as it would get. So that's hundred percent  
6           full by this definition. And then looking at  
7           bedrock average of the index cell would  
8           represent the bottom. So we look at what that  
9           whole saturated thickness is and that is a  
10          relative percent full as plotted through time  
11          here.

12                        The other things that are plotted on  
13          here, we have groundwater elevations from 1993.  
14          We also have groundwater, or the ground surface  
15          elevation, as just illustrated, general depth of  
16          bedrock, if someone wants to calculate that from  
17          the left side. The blue line is the upper  
18          groundwater elevation and red line is the lower  
19          groundwater elevation at this particular site  
20          for this example.

21        Q.    So would that red line on the graph be a  
22              reflection of the 1993 index level?

23        A.    Yes.

24        Q.    And in this graph, as we are going, well, along  
25              the bottom where it says we are going through

1 the ten-year period from the start to the end.

2 And is this graphic showing that the impact of  
3 the model pumping never reduces the water levels  
4 in this index cell below the 1993 index level?

5 A. That's correct.

6 Q. Let's go to the next one. And the thick black  
7 bar near the top of purple columns, is that your  
8 ground surface level?

9 A. That's correct.

10 Q. So now I have to ask this question to clear up  
11 confusion. The purple columns extend upward,  
12 well above that black bar that is showing ground  
13 surface level, I should not conclude from that  
14 that the water levels will be that high above  
15 the ground surface level in those ten years of  
16 drought modeling, should I?

17 A. No. That would be an incorrect conclusion.  
18 This is the limits of the Excel plot that we had  
19 at the time to create double axis, that is why  
20 we see those purple.

21 THE HEARING OFFICER: Can you explain  
22 that?

23 A. Yes. The purple values are the only ones that  
24 we want to read off of the right side axis, if  
25 that makes sense. The vertical purple bars are

1 the only things correlating to the right side,  
2 percent remaining full. The limits of the Excel  
3 program that we had for this particular graph  
4 set up wouldn't let us correlate the elevation  
5 to, in this case, percent full without creating  
6 some anomalies, it would make the lines flat for  
7 the water elevation changes.

8 THE HEARING OFFICER: So when we look  
9 at these we disregard the purple elevations  
10 unless we are looking at the right axis?

11 A. Perfect.

12 BY MR. McLEOD:

13 Q. In addition to that, in this graph we see that  
14 the, that the AMC pumping lines, they do in this  
15 one, go below the red line in about year four or  
16 five. It's hard to tell by reading the graph,  
17 but it looks like maybe they get there at year  
18 four.

19 A. Yes.

20 Q. And this one they end up below the 1993 levels  
21 as an impact of the model drought?

22 A. That's correct.

23 Q. Let's go to the next one. And on this one are  
24 we saying that basically from the get go we are  
25 going to be in trouble with the 1993 index

1 levels in this cell.

2 A. Let me find hydrograph 3 here. Okay.

3 Q. It looks like the pumping is going on in this  
4 simulation below the existing 1993 index levels.

5 A. Yes.

6 Q. And so under the current permit conditions we  
7 wouldn't be taking credits from this well in  
8 this model drought?

9 A. Yes, if we had infrastructure available to  
10 recover credits in this case, cell 3, it would  
11 not be allowed, that's correct.

12 Q. Let's look at the next one.

13 A. Okay.

14 Q. This one is also, this one is showing basically  
15 through the model drought we don't get below the  
16 1993 index levels in this cell; is that correct?

17 A. That is correct. At least for the lower aquifer  
18 value, which I believe is what the index levels  
19 are set from.

20 Q. What is the blue straight line that goes across?  
21 Is that the upper level?

22 A. That's correct. Well, no. The blue line, well,  
23 there are generally two index sites, an upper  
24 index well and lower index well, depending where  
25 you go in the aquifer, we see some had

1 differences between those, others had very  
2 little. So we decided to plot those just for  
3 informational purposes. I believe the one that  
4 is permitted, and the one we should be referring  
5 to, is the red.

6 Q. I wanted to make sure that we did a few of these  
7 so that I could understand how to correctly read  
8 what they are trying to depict. And the purple  
9 bars, red against the right index, those are  
10 attempting to depict what, Mr. Clement?

11 A. The relative percent full of the aquifer based  
12 on an average of the index cell. So we look at  
13 the water level elevation for that particular  
14 year, and we compare it as a percentage to  
15 predevelopment, and then come up with that  
16 percentage and plot it as a the purple bar.

17 Q. What's the area of each of these index cells,  
18 how big are they?

19 A. I believe they are roughly four square miles  
20 total.

21 Q. So all of the wells within this index cell they  
22 would be within that 4.4 square mile area?

23 A. Yes, the index wells are generally located in  
24 the index cells, yes.

25 Q. Okay. So if I am understanding what you are

1 saying about the purple bars, when I look at the  
2 first year, it is almost, the aquifer is almost  
3 hundred percent saturated in this scenario. And  
4 when we get back to, when we get back, well,  
5 year ten is a recovery year, isn't it; but it  
6 looks pretty flat, from years 8 through 10 we  
7 are about 95 percent saturated in this index  
8 cell?

9 A. According to the graphic, yes.

10 Q. Thank you. I think I understand now what you  
11 are doing with those. So this is kind of the  
12 set of data that let you know as to the various  
13 index cells what drought year the City gets in  
14 trouble with the 1993 index levels in the  
15 various cells; is that correct?

16 A. That's correct.

17 Q. And so it gives you the picture, when you  
18 consider the data that's provided by all of  
19 these, the hydrographs and the modeling results  
20 that relate to them, it gives you the data of  
21 the drought year in which the City becomes  
22 unable to recover its credits in each of those  
23 index cells?

24 A. Yes. And I believe we actually generated that  
25 as a figure in the front end of Attachment I, so

1 we provided, I believe a spatial distribution of  
2 that just to illustrate where and when that  
3 occurs in the drought years.

4 Q. Let's go back and look at that figure as well  
5 and walk us through that.

6 A. Sure. So basically the index cells there that  
7 are kind of the boxy areas, we have put this out  
8 to the basin storage area. You can see that, it  
9 is kind of the bigger outlying area in purple.  
10 And we also had the central well field storage  
11 area in the smaller box in the middle. In the  
12 upper right-hand corner is the legend and it  
13 starts at year one in kind of red and orange and  
14 goes on through year six of the drought. This  
15 is showing when and where credits would become  
16 unavailable based on the drought model  
17 conditions. So it gives you a spatial  
18 distribution and when that would occur by index  
19 cell according to the model results.

20 Q. So in year two how many of the index cells would  
21 be in a state where the City could not recover  
22 credits under the current permit conditions?

23 A. If we say by year two you would have to count  
24 the red and orange to be correct there. So  
25 based on, and this is a printout, I am counting

1 red and orange, 1, 2, 3, 4, 5, 6, 7, according  
2 to mine, seven, that would be 38, 24, 25 and 38  
3 according to the count I just did. And 14 and  
4 18.

5 Q. And how many total in your year three would be  
6 enable to recover credits under the current  
7 conditions?

8 A. We would add IW 10 and 16 and 21 and 28 to that  
9 count.

10 Q. And the boxes that are not shaded any color, are  
11 those index cells in which the City would be  
12 able to still recover some credits throughout  
13 the entire model drought period?

14 A. Based on the drought model predictions on  
15 groundwater conditions, yes.

16 Q. Are there other considerations that would  
17 practically change that answer, considerations  
18 other than the modeling, that would have to do  
19 with what infrastructure in place in those  
20 cells?

21 A. Yes, you could have a redistribution of pumping.  
22 We distribute city pumping based on kind of a  
23 normalization of what each water right of each  
24 city was for recovery of credits. In other  
25 words, the stronger pumping wells we would

1           assume would also be stronger pumpers of ASR  
2           credits. If for some reason they weren't  
3           available or saw some change in density of  
4           population in some given area, we would see more  
5           color on the map here where, let's say, in index  
6           cell 26, is an example, you may not be able to  
7           recover credits there just because of  
8           distribution of pumping change and a change  
9           versus in what we predicted in the model.

10       Q.    So through some of my earlier questioning, and  
11           in some cases attempting questioning that was  
12           often excluded, where I was assuming that it  
13           would be a general occurrence in year two that  
14           the City would be unable to recover credits,  
15           that's too simplistic, wasn't it, as we look at  
16           the results of your modeling?

17       A.    Sure. There is a general distribution of that.

18       Q.    And this map would be a more accurate reflection  
19           of when the modeling shows for index cell that  
20           that problem would occur with respect to the  
21           1993 index levels?

22       A.    Correct.

23       Q.    Let's go in the proposal to table 2-10 and 2-11.  
24           Let's look at 2-10 first.

25       A.    (Witness reviews documents.) Which one did you

1 want to look at first?

2 Q. Let's look at 2-10.

3 A. Okay.

4 Q. How did you come up with the proposed revised  
5 ASR index levels that are in the proposal?

6 A. We took the minimum, and there are a couple of  
7 different ways here. So if we look at the  
8 fourth column from the left, it gives a basis  
9 for the proposed level. So as we saw in that  
10 previous figure, there was some locations that  
11 didn't drop below the minimum index level, but  
12 again, we wanted to be prepared for distribution  
13 of pumping, any changes in future ag pumping  
14 that may occur and changes in multiyear flex  
15 accounts, we just wanted to be prepared for  
16 that. So any ones we see existing we buffered  
17 the existing 1993 level by a number and that was  
18 generally ten feet for anything except IW1 and  
19 IW2.

20 For the ones that say modeled we looked  
21 at the output for each one of the index well  
22 sites, at least correlating to that particular  
23 model cell where that index well lied. We  
24 pulled the elevation from that throughout all  
25 the stress periods and found the minimum

1 elevation. And then we took the same approach  
2 with contingency to that minimum elevation and  
3 buffered it. In general I would say, for  
4 purposes of simplicity, ten feet.

5 Looking at the table it looks like  
6 there is a typo in column 5 under contingency  
7 added for IW1 and 2. It looks like that's just  
8 a typo, and in those two lowest levels are, it  
9 looks like accurate, it just looks like the  
10 contingency number is off.

11 Q. So in those rows as we go across, that's why the  
12 math is not tying out, that if you look at the  
13 numbers for existing level, and then the  
14 contingency and the proposed level, it doesn't  
15 come out because the contingency number is  
16 wrong, right?

17 A. At least on IW1 and 2. And also did rounding on  
18 the others, I mean, just general scientific  
19 notation on those just to get to the level  
20 precision that's appropriate.

21 Q. But you are saying in each of those rows, IW1  
22 and 2, the 1390 figure is the level that's being  
23 proposed as the new index level for those wells?

24 A. Correct.

25 THE HEARING OFFICER: I am sorry, could

1           you clarify what your correction is.

2       A.     So in IW1 and IW2, for those two rows, it looks  
3           like the contingency added the column for those  
4           two rows, it looks like there is a typo there;  
5           however, I believe the proposed levels, the  
6           farthest right column of 1390 feet for both IW1  
7           and IW2 are both correct.

8                         THE HEARING OFFICER:   What exactly do  
9           you think is typo?

10       A.    The typo would have occurred in the contingency  
11           added column for IW1 and IW2, it just looks like  
12           we may have just had contingency in there from a  
13           different model or something.

14                        THE HEARING OFFICER:   So you think the  
15           20 and 10 are an error?

16       A.    Yes.

17                        THE HEARING OFFICER:   But you don't  
18           know what they should be?

19       A.    It would be the delta between the minimum  
20           drought elevation, or no in this case it would  
21           be the existing level of 1413, the delta between  
22           1413.42 and 1390.   That would be the  
23           contingency.

24                        THE HEARING OFFICER:   But your final  
25           column is correct?

1 A. That's correct. The proposed column for 1390 is  
2 correct for those two.

3 THE HEARING OFFICER: Thank you.

4 BY MR. McLEOD:

5 Q. I also noticed Mr. Clement, in looking at the  
6 table on most of these, when you compared the  
7 minimum drought model elevation and the  
8 existing, most of the time the lower of those  
9 two, plus the contingency became the proposed  
10 level. But in the case of the second row, the  
11 IW02 well, where you have a minimum drought  
12 model elevation of 1407.96, and your existing  
13 level of 1410.52 is higher and in that row you  
14 went with the higher, the existing level for  
15 estimations for your proposed level. Why is it  
16 different in the row for that well as opposed to  
17 how it was done for all the others?

18 A. I believe there are some significant water level  
19 swings in that area. I don't recall all the  
20 specific details. Some of that coordination was  
21 done with my colleague, who ran the model; but  
22 we went with the existing. I don't anticipate  
23 any recovery at that site so to pick between  
24 1413 or 1429 working with IW2 we went with the  
25 existing. We probably thought, at the time we

1 probably thought it was simpler.

2 Q. So I mean it may not make any difference if  
3 there is no recovery infrastructure there, is  
4 that correct?

5 A. That would be my assessment, yes.

6 Q. Let's go on to look at table 2-11.

7 A. Okay.

8 Q. And let me back up and ask a question, to be  
9 clear. All of these wells that we are proposing  
10 a change in the lower index level, are those  
11 only for ASR Phase II infrastructure?

12 A. That's my understanding. The proposal and the  
13 City's wishes is that any of the proposed  
14 modifications to the index levels would only  
15 occur for Phase II infrastructure and not for  
16 Phase I.

17 Q. So the Phase I index levels are being left  
18 intact.

19 MR. STUCKY: Was that a question? It  
20 sounded like testimony by counsel whether or not  
21 the Phase I was intact. Was that a question?

22 MR. McLEOD: It was an implied  
23 question.

24 BY MR. McLEOD:

25 Q. Are the Phase I index levels being left intact?

1 A. Yes.

2 Q. I wanted to make counsel happy. I hope that I  
3 have. Let's go on to table 2-11.

4 A. Okay.

5 Q. I have one more clean up.

6 A. Sure.

7 Q. Counsel asked of an earlier witness who wasn't  
8 sure. Is the intent that wherever the index  
9 levels are posed to be changed for ASR Phase II  
10 that those levels would be changed for future  
11 infrastructure that's part of the ASR Phase II?

12 A. I anticipate that that would be part of the  
13 proposal.

14 Q. And if a person went to other ASR phases where  
15 other infrastructure were added in the same  
16 index cells, where ASR Phase II infrastructure  
17 is currently, would the proposed levels apply to  
18 those new infrastructure developments as well?

19 A. Say the question one more time.

20 Q. If there were a later phase of ASR where we  
21 added infrastructure to the same index cells  
22 that are within ASR Phase II, would these lower  
23 index limits apply to those subsequent phase  
24 improvements as well?

25 A. Yes, according to the proposal, yes.

1 Q. Thank you. Now, looking at table 2-11 can you  
2 walk us through.

3 A. The main goal is to communicate the difference  
4 in the proposed levels versus the existing  
5 levels. That's the main goal. And also to  
6 illustrate, approximate the aquifer saturated  
7 thickness, based on what the model says the  
8 aquifer saturated thickness is. And then also  
9 provide a relative percent full. People think  
10 of the aquifer in different ways, this is trying  
11 to phrase it in those different ways.

12 For example, if we go to line index  
13 cell 10 there, the existing 1993 level is  
14 1375.09, the proposed 1358, delta of 17.09. The  
15 proposed remaining aquifer saturated thickness  
16 on average within that index cell, according to  
17 model, is roughly 165 feet. And then that still  
18 leaves 76% of the saturated thickness relative  
19 to predevelopment.

20 Q. So of the numbers that are most important in  
21 this table, that existing versus proposed  
22 column, tells you how far down the proposed new  
23 limit would go from the existing limit in a  
24 particular index cell; is that correct?

25 A. That is correct.

1 Q. And then the far right column is telling you if  
2 you pumped down to that level, is it telling you  
3 if you pump down to that new proposed level, how  
4 much of the saturated thickness of the aquifer  
5 would still remain?

6 A. That's correct.

7 Q. So it looks like we have some numbers on that  
8 saturation as small as 67% and it looks others  
9 are as high as high as 90%. Do you know what  
10 the average is?

11 A. That would be calculated in one of the previous  
12 tables, entire basin storage area, it would have  
13 been that number.

14 Q. And where we are looking at the difference, the  
15 difference in depth between the existing and  
16 proposed, what's the range of numbers there?  
17 What's the one with the smallest change?

18 A. At a glance here it looks like index cell 5 at  
19 9.23. No, I found a 9.1 on index cell 9.

20 Q. What's the one that will have the greatest  
21 difference between the existing and proposed  
22 lower index?

23 A. It looks like index cell, let me go through it  
24 one more time. I believe index cell 1 at 23.

25 Q. And being a hydro geologist, can you tell me, am

1 I being oversimplistic in my thinking that if I  
2 owned a well in index cell 1 and I thought I was  
3 going to have a problem with modeling that  
4 showed impacts of pumping going down to the new  
5 proposed, or new proposed low index levels,  
6 could I fix that problem by extending my well  
7 23.42 feet, the same amount that you are  
8 changing the index level with the proposal?

9 A. Yes, I mean, that's why if you compare the delta  
10 to the remaining saturated thickness, you would  
11 have that additional 23 feet to 131 to extend a  
12 well, at least according to the model.

13 Q. So if the City reached a point that it new it  
14 was going to have to draw credits, in a  
15 prolonged drought scenario, and knew that it was  
16 going to go below in the course of that, in the  
17 1993 index levels, and that it might start  
18 worrying about whether individual wells were  
19 going to be impacted, could the City figure out  
20 in the index cells most likely to be affected,  
21 which wells would need to be extended and extend  
22 them for the well owners on the number of feet  
23 shown in that central table, and get those wells  
24 below where they would be impacted by going to  
25 the new index levels?

1 A. I believe so. It would give you an elevation  
2 basis and say I might have a problem based on a  
3 well depth and a land surface elevation and  
4 estimate that, yes, ahead of time.

5 Q. I don't know if you have background to answer  
6 this question, have you been involved with  
7 enough drilling and installation of wells to  
8 know how long it would take to do that kind of a  
9 well extension?

10 A. I think you could do a domestic. Are we talking  
11 domestic well or large completion well?

12 Q. Domestic well.

13 A. Domestic well at these depths you could probably  
14 get in and out in a day and have it recompleted.  
15 And then another day come back and do the  
16 development. So in a matter of days have an  
17 issue solved, if you needed to, assuming driller  
18 availability.

19 Q. And I think you were here for Mr. Henry's  
20 testimony where he suggested that the best  
21 approach would be to try to get that done before  
22 it caused an actual problem, is that feasible,  
23 given the time you think it would take to do a  
24 domestic well extension?

25 A. I think so, with enough heads up and

1 coordination. I don't see an issue with that.

2 Q. Based on your knowledge of the ASR recharge  
3 wells, do the recharge wells have a minimum and  
4 a maximum design recharge rate based on the  
5 physical limit of valves and piping?

6 A. Yes.

7 THE HEARING OFFICER: I have a  
8 question. And forgive me if I am missing  
9 something completely obvious.

10 A. You are doing an expert job speaking modeling.

11 THE HEARING OFFICER: Considering how  
12 little I have said. Table 2-11 that we have  
13 been looking at, the existing level column it  
14 says 1993 level, so that's the water level in  
15 1993?

16 A. Yes.

17 THE HEARING OFFICER: Which is the  
18 current --

19 MR. McLEOD: That's the index level.

20 THE HEARING OFFICER: Index level. The  
21 proposed level, which is proposed to be lower,  
22 is a higher number. So it looks to me like it's  
23 not as far down. It's less. See what I am  
24 saying? If your existing level is 1400 feet and  
25 you are proposing 1390, you are not going down

1 as far. What am I missing?

2 A. Is that, okay, these are elevations so not  
3 depths, they would be elevations above sea  
4 level.

5 THE HEARING OFFICER: That's what I am  
6 missing. Thank you. Counting from the bottom  
7 up.

8 A. It would take a long time to drill a well 1,390  
9 feet.

10 THE HEARING OFFICER: I didn't make the  
11 graph, I am trying to figure it out. Please  
12 continue.

13 BY MR. McLEOD:

14 Q. So what would be the well condition that would  
15 represent maximum recharge capacity, and a  
16 condition with the single smallest, or that  
17 would represent, excuse me, represent the  
18 minimum?

19 A. So each, I will speak to the infrastructure real  
20 quick. Each recharged well, at least in Phase  
21 II of the project, has a number of recharge down  
22 tubes which facilitate injection of that water  
23 below surface level. So those injection tubes  
24 are on the outside of the casing so until they  
25 enter the inside of the casing, generally below

1 water level. Those different tubes, the tubes  
2 are different sizes and that allows for  
3 different rates. So to answer your question,  
4 each well has a minimum and maximum rate based  
5 on the sizing of those tubes. So the minimum  
6 construction would be one of the smallest tubes,  
7 and that would be, in general, roughly 50  
8 gallons per minute versus all the tubes that  
9 were at the site being open, and those recharge  
10 rates could be, I think design is roughly 1,000  
11 gallons per minute, or even perhaps higher.

12 Q. Is recharge well capacity, is it also related to  
13 groundwater levels?

14 A. Yes. The lower the groundwater levels,  
15 generally higher the recharge capacity. The  
16 higher the groundwater levels, the lower  
17 recharge capacity, assuming if we have to  
18 maintain a buffer, a minimum of ten feet in the  
19 recharge well casing based on operations, yes.

20 Q. So as water levels in the aquifer are lower,  
21 basically that means the recharge capacity is  
22 higher?

23 A. That's correct.

24 Q. And if you can answer this, some earlier  
25 witnesses who didn't have the capability to know

1           this from the modeling themselves suggested  
2           that, that the City's ability to recharge  
3           approximately 30 million gallons per day would  
4           be at water levels in the aquifer roughly  
5           equivalent to the 1998 levels. Do you know from  
6           the modeling if that is true?

7       A.    We did not model that within the model. We  
8           didn't model recharge rates and sustainability.  
9           That's really a well-by-well question, that is  
10          more related to the infrastructure and how it  
11          actually behaves. You can generally correlate a  
12          groundwater elevation to the capacity of a well  
13          and I believe that's how that was generated. I  
14          don't recall generating that number personally,  
15          I don't know where it came from, but in my  
16          opinion, 1998 level seems comparable with the  
17          injection values to be able to create a  
18          sustained recharge rate, at a 30 MGD, I do think  
19          you could do it.

20       Q.    Did the City permit conditions, the existing  
21          conditions, limit how high water levels are  
22          allowed to get in the recharge well during  
23          recharge operations?

24       A.    I don't believe it is based on the recharge  
25          well, I think it's on a nearby site or a

1 distance, and I think that was quoted earlier;  
2 but in practice my familiarity with the City's  
3 operations I spent during commissioning of the  
4 plant and certainly commissioning during  
5 recharge events, I think the city limits, to  
6 this date, ten foot below land surface or ten  
7 foot below land surface within the well house  
8 itself, so ten foot below land surface  
9 indication would be the injection well is the  
10 limit we impose on ourselves. And I believe  
11 there is an actual permit limit that is in  
12 accordance with the ten feet below surface on a  
13 nearby observation well.

14 Q. Are any of those conditions proposed to be  
15 changed in any way in the proposal?

16 A. No. Not that I know of.

17 Q. Does the proposal include details on the  
18 eligibility of the City to approve aquifer  
19 maintenance credits based on the physical  
20 recharge capacity of the ASR system?

21 A. Yes, we developed essentially, if you want to  
22 think of it this way, what's the guarantee that  
23 the City will put physical recharge in the  
24 system. How do we figure that out? I believe  
25 we developed a table in the report, I don't

1 recall which one it was, but we took a look at  
2 developing a draft operations plan. In other  
3 words, if the City says they will conduct  
4 recharge operations, how do we know they will do  
5 that? How do we guarantee that? We got the  
6 permit condition. We took a shot at that within  
7 the proposal based on our knowledge of how the  
8 recharge wells behave in real life. We took  
9 actual operations data and regenerated that  
10 operations table that's a figure within the  
11 report.

12 Q. Let's look at figure 14 of the proposal.

13 A. Okay.

14 Q. Is this the graphic that you were referring to a  
15 minute ago in your testimony?

16 A. Yes.

17 Q. And can you walk us through this?

18 A. Sure. Let's start at the top line to keep it  
19 easy. So we have just got, as an example MRO2  
20 is an actual recharge well in the City's ASR  
21 structure as part of Phase II. This is an  
22 example of January 2016. So we actually took  
23 the City reported level, taken from that well,  
24 they actually went out and measured water levels  
25 in 2016 in January and received a total depth of

1 water 37.6 feet. That correlates, based on the  
2 design data that we have, to a static  
3 groundwater elevation at that site of 1396.9.  
4 The maximum groundwater elevation that we could,  
5 therefore, recharge to --

6 Q. Mr. Clement, can you pause just for a minute.

7 THE HEARING OFFICER: I am not finding  
8 figure 14.

9 MR. McLEOD: I saw you were flipping so  
10 I thought we should stop and let you catch up.

11 THE HEARING OFFICER: I found it.

12 A. I will start over.

13 BY MR. McLEOD:

14 Q. Thank you.

15 A. Let's start with MRO2 there, that's an actual  
16 physical well in the City's well field Phase II  
17 on the north end of City's well field. So in  
18 January of 2016 they went out and measured water  
19 levels at that well and came up with a total  
20 depth of water from top of casing of 37.6.  
21 That's an actual physical measurement. That  
22 correlates, because we have the elevations of  
23 the top of the casing and everything there for  
24 the elevation of the groundwater of 1396.9. So  
25 the theoretical maximum we could recharge,

1 assuming ten foot below ground surface at that  
2 site, would be 1420.3. That gives us an  
3 available water column. So from the static  
4 measurement to ten foot below ground surface  
5 that elevation of 23.4.

6 And then this next column I will talk a  
7 little bit more in detail. So the nice thing  
8 about this project is we have the well-by-well  
9 behavior down to a science at this point. There  
10 is skada data from each one of these sites that  
11 tells us how much water each well will take  
12 under any given condition. So in order to  
13 create injection, long term, initially the well  
14 will take a lot and then it peaks and then it  
15 stabilizes. So Burns & McDonnell looks through  
16 heaps of skada data over the full duration for  
17 MRO2 and we kind of learned what that well will  
18 take from a sustainable day-to-day basis. We  
19 think we can get five gallons per minute per  
20 foot in there.

21 Now, that five gallons per minute per  
22 foot comes from if we inject five gallons per  
23 minute we get a foot of rise in the casing, if  
24 that makes sense. So we have a total column of  
25 23.4. So those two things are going to be

1 related. Our available water column is really  
2 going to determine, along with our injectivity  
3 number, how much we can come up with a feasible  
4 recharge rate for each well.

5 So this is our attempt to look at how  
6 much recharge well will do. You could do that  
7 across the entire well field and then come up  
8 with theoretical recharge capacity for, in this  
9 case, Phase II, or at least the recharge  
10 injection sites.

11 So if we stick with MRO2, based on the  
12 water column available, and the injectivity rate  
13 in gallons per minute per foot, we can get about  
14 117 gallons per minute in there sustainably. We  
15 know that our maximum well infrastructure  
16 recharge rate, based on all of the down tubes  
17 open, is thousand gallons per minute, by design,  
18 that is a hydraulic design. We know that our  
19 minimum well infrastructure recharge rate is 125  
20 gallons per minute.

21 So in this case we have an actual  
22 infrastructure. The minimum rate we can inject  
23 at is 125 gallons per minute, just based on the  
24 down tube sizing. So if we look at the  
25 availability of this recharge, we can't do it,

1 we simply can't do it because we don't have  
2 enough water column, number one. Number two,  
3 the very small down tube that is in that well  
4 won't allow for anything less than 125 gallons  
5 per minute, otherwise, we start cascading water  
6 and are having hydraulic issues. So this well  
7 wouldn't be available in physical recharge  
8 capacity because water levels are so high at  
9 this site.

10 But if we could go to another example I  
11 could show you where this would work. If we go  
12 to MRO4, static water level 37.69, I won't bore  
13 you with elevations, but we have 24.45 feet of  
14 water column available in this example. This  
15 has a better injection rate, 8 gallons per  
16 minute per foot. Our sustainable recharge is  
17 there for 196 gallons per minute. The max we  
18 could ever inject at that site, by design, is  
19 1,000, the minimum is 125. So, hey, we have an  
20 actual chance to put some water in the ground,  
21 196.

22 So well-by-well you can carry this out  
23 and come up with a generally pretty good number  
24 for the well capacity of the entire ASR Phase II  
25 system. So probably the next, I thought I heard

1 a question.

2 Q. Yes. I was actually going to ask you about  
3 that. Based on aggregating the figures for the  
4 wells, what would be the maximum aggregate  
5 recharge capacity of all of those ASR Phase II  
6 recharge wells together?

7 A. Everything combined, everything open, all well  
8 tubes open 34.5ish MGD, million gallons a day.

9 Q. So if the capacity is there to inject that is  
10 what the infrastructure maximum would allow you  
11 to you inject?

12 A. Yes.

13 Q. And then if we take it the other way, based on  
14 your knowledge of the system, and the numbers  
15 that have been derived and summarized there,  
16 what is the minimum recharge capacity of all ASR  
17 Phase II recharge wells combined, if we assume  
18 the minimum infrastructure rate of all of those  
19 wells?

20 A. That would be 5.72.

21 Q. Does the proposal include an estimate of the  
22 physical recharge capacity of individual wells  
23 and the recharge system to determine eligibility  
24 for the City receiving AMCs?

25 A. Yes. I think that's what is being proposed here

1           in figure 14, there is an example of an  
2           operations program that will determine physical  
3           recharge capacity. So relative to AMCs you  
4           wouldn't get an AMC credit for anything you  
5           could physically inject, and that's the basis  
6           for that.

7       Q.    In the example shown in the exhibit, the high  
8           groundwater level shown from the observations in  
9           2016, would those limit recharge, even with all  
10          ASR Phase II wells available, to only about 819  
11          gallons per minute or 1.18 million gallons per  
12          day?

13       A.   That's correct.

14       Q.    And given the relationship between the aquifer  
15          being full, or less full, and whether there is  
16          capacity for physical recharge, if the City  
17          returned to pumping its full base right from the  
18          aquifer of 40,000 acre feet, lowering aquifer  
19          levels, would pumping down the aquifer create  
20          additional recharge capacity?

21       A.    Yes.

22       Q.    Do you have a sense from any data that you have  
23          reviewed, Mr. Clement, how long the City would  
24          have to pump the aquifer down at the 40,000 acre  
25          feet per year represented by its base rights to

1 get to the 1998 levels?

2 A. I didn't run that analysis. I mean, it would be  
3 parallel to how long it took to get there in the  
4 first place from some of those levels. Each  
5 hydrograph would have to be considered. So even  
6 if you were pumping 40,000 if you had like river  
7 flows or precipitation it would take you longer.  
8 I don't have a guess today without modeling.  
9 That's probably how I would approach it.

10 Q. There have been quite a few questions over the  
11 last couple of days about the aquifer  
12 maintenance credits and the accounting and how  
13 that works. Do you have background and  
14 knowledge of the accounting method for the AMCs?

15 A. I worked on an accounting report for the City  
16 for a number of years, so I am familiar with it.  
17 There are probably others that could probably  
18 answer, at least from the AMC perspective, how  
19 physical recharge credit accounting is done and  
20 how parallels of how AMCs can be done.

21 Q. Who would be a better witness for that?

22 A. I think Paul McCord will be, I think he is  
23 available for that, because he has done actual  
24 accounting runs and post processing of that data  
25 and could get into that a little deeper and for

1 the hearing process.

2 MR. McLEOD: Thank you. I don't have  
3 further questions for the witness.

4 THE HEARING OFFICER: Mr. Oleen.

5 MR. OLEEN: Yes, please.

6

7 CROSS EXAMINATION

8 BY MR. OLEEN:

9 Q. Mr. Clement, I think you answered my question  
10 that I had attempted to ask of a previous  
11 witness concerning figures 10 and 11 of the  
12 proposal. But I would like to make sure. So  
13 with respect to figures 10 and 11 in the  
14 proposal, do you have those?

15 A. Table 2-10?

16 Q. Figures. Just the figures for now.

17 A. Which one did you want to look at first?

18 Q. Figure 10, you created that; is that correct?

19 A. I created this figure, yes.

20 Q. Do I understand it correctly that as far as the  
21 blue percentage numbers of average optimal  
22 condition percent full, that shows by index cell  
23 the percentage fullness condition at the end of  
24 the simulated eight year 1% drought; is that  
25 correct?

1 A. Yes. That is the end of the simulated stress  
2 period. It's not the proposed level, it's the  
3 end of the simulated drought on stress period 8.

4 Q. And so, or during the course of that simulated  
5 eight year drought, it's not the case that the  
6 model projected that actual water levels needed  
7 to go down all the way to the new proposed  
8 bottom for each index cell; is that correct?

9 A. That's correct.

10 Q. Okay. But figure 11 now, am I correct in  
11 understanding that those percentages do show  
12 percent fullness, assuming that actual water  
13 levels are down in each index cell level to each  
14 of the new proposed minimum index cell levels?

15 A. That appears correct.

16 Q. Okay. And essentially figure 11, isn't it a  
17 visual display of the right most column in table  
18 2.11 as far as the percentages?

19 A. Those numbers should correlate, yes.

20 Q. Okay. And I think Mr. McLeod asked this  
21 question, and I can't recall your answer, or if  
22 you did, I think he asked what is, as far as  
23 that right most column on table 2-11, what is  
24 the average of all of those percentages for all  
25 of those 38 index cells?

1 A. Let me look to see if I have that in the table  
2 real quick. (Witness reviews documents). We  
3 may have put that in a text. I don't see it in  
4 a table. That doesn't mean it's not in the  
5 record, I just don't have that directly in front  
6 of me.

7 Q. Well, let's look at Page 2-23 of the proposal.  
8 In summary section 2.7. In the text there,  
9 there is a sentence that says: The groundwater  
10 modeling results indicate that the end of  
11 simulated 1% drought the aquifer will be  
12 approximately 86% full across the EBWF area and  
13 89% full across the entire basin storage area.  
14 That statement is describing figure 10; is that  
15 correct?

16 A. That's describing figure 10 which should  
17 correlate to the end of the stress period 8.

18 Q. But at least right now you are not aware of  
19 similar text that gives a written description of  
20 the overall average of the percentages that are  
21 shown in figure 11?

22 A. I don't recall where that, if we did it, I don't  
23 recall where it's at in the report, no.

24 Q. Based on the right most column, in table 2-11,  
25 are you there? 2-11, right most column?

1 A. What page?

2 Q. 2-25.

3 A. Okay.

4 Q. I am not going to ask you to average all of  
5 those percentages right now, but looking at them  
6 does it seem that they might average somewhere  
7 around 80%?

8 A. That was actually what I was going to say, yes,  
9 I think in the 80s would be reasonable.

10 MR. OLEEN: Nothing further. Thank  
11 you.

12 THE HEARING OFFICER: Why don't we take  
13 about a five or ten minute break.

14 (REPORTER'S NOTE: At this time,  
15 4:10 p.m., a recess was taken, after which,  
16 4:24 p.m., the following proceedings were held:)

17 THE HEARING OFFICER: Back on the  
18 record. It's 4:26. And, Mr. Stucky, I think we  
19 had moved on to you, were you next?

20 MR. STUCKY: Yes.

21

22 CROSS EXAMINATION

23 BY MR. STUCKY:

24 Q. All right. We are on the record now, and I  
25 would ask that you flip to Exhibit 27. It's

1           your CV, if you know where that is in the many  
2           books before you.

3       A.    Yes, I believe I have it here.

4       Q.    I am unclear on your CV, I am just a little  
5           unclear, where was it you got your BS in  
6           geology?

7       A.    Kansas State University.

8       Q.    And when you got your BS in geology, did that  
9           constitute courses in hydrology?

10      A.    Yes.

11      Q.    How many courses in hydrology?

12      A.    I am trying to remember, at least one or two,  
13           yes.

14      Q.    How many courses in hydro geology?

15      A.    Specifically, one course that was technically  
16           hydro geo and hydro all together, incorporated.

17      Q.    How does that work when you have a degree in  
18           geology? Can you get an emphasis in a  
19           particular area, such as hydrology or an  
20           emphasis in hydro geology if you choose to?

21      A.    It depends on the university. I mean, most  
22           geologists come out and you have a career path,  
23           it's a little different than engineering, in  
24           that you get specific emphasis, or whatever.  
25           Generally there is an environmental field, or a

1 hydro geo field or an oil field. In schooling  
2 up, in your senior or junior year, you can kind  
3 of pick those courses. At least at Kansas State  
4 University they didn't have a particular  
5 emphasis, no. It was an elective or graduate  
6 with an emphasis.

7 Q. Have you done any master level course work in  
8 hydro geology or hydrology?

9 A. No.

10 Q. After you graduated from Kansas State  
11 University, I guess I am trying to determine  
12 from your resume where it was you worked after  
13 you graduated.

14 A. So after I graduated I went to work with Kansas  
15 State University running essentially their IT  
16 support system, assisting and directing with  
17 administrative services there. The job market  
18 for geology wasn't great right out of college,  
19 for me, at least. And then I went with  
20 Groundwater Management District Number 2 so I  
21 had an opportunity to work with them for a  
22 number of years.

23 Q. How many years was it that you worked at K-State  
24 after you graduated?

25 A. I am trying it remember, it wasn't very long in

1           that official position. I worked IT during and  
2           after college maybe six to eight months maybe a  
3           year total something like that.

4       Q.    So between six to eight months and a year later  
5           you were employed then by the GMD2?

6       A.    Yes.

7       Q.    How did it go about that you received that job?  
8           Did you apply for it? Or did Mr. Boese recruit  
9           you or how did that work?

10      A.    I believe I saw a job application and applied.

11      Q.    How many years did you work for GMD2?

12      A.    I believe my services there ended in 2013,  
13           before going to work for Burns & McDonnell.

14      Q.    So that would have been what years, tell me  
15           again.

16      A.    I believe 2010 through 2013, certainly I  
17           remember 2011 and 2012. I think that's accurate  
18           off the top of my head.

19      Q.    So just a ballpark figure, roughly three years  
20           you worked for GMD2?

21      A.    I believe that's accurate.

22      Q.    Prior to working for GMD2, at least your job at  
23           Kansas State University, you didn't, when you  
24           did the IT work there you weren't doing any work  
25           in hydrology yet, is that right?

1 A. Not hydrology specific. I did assist with  
2 establishment of GIS servers, I was their  
3 network support technician for that. And I also  
4 set up the administration of GIS servers, so as  
5 much as that overlaps.

6 Q. During that time you wouldn't have run any kind  
7 of models with respect to hydrology or hydro  
8 geology or anything of that nature?

9 A. No, sir.

10 Q. When was it you first encountered running models  
11 with respect to hydrology? Was that when you  
12 started working for GMD2?

13 A. Basic introductory courses within hydro geo  
14 during college, and in hydro geology and  
15 hydrology courses you go through the basic  
16 analytical approaches of well drawdown or very  
17 basic concepts and some computer modeling in  
18 that. Really that's just introductory stuff.  
19 My first instance of getting in to any computer  
20 modeling of groundwater systems would have been  
21 with GMD2, that would be the earliest I produced  
22 anything.

23 Q. I assume that when you first started at GMD2 and  
24 you hadn't done that kind of work previously  
25 somebody would have probably had to help train

1           you; is that correct?

2       A.    Sure.  I recall going through, I believe it was  
3           GMS at the time, went through a GMS download and  
4           it was an online training course that I elected  
5           to take while I was there.

6       Q.    Would Mr. Boese have also trained you in that  
7           regard?

8       A.    I don't know that he specifically trained me.  I  
9           think he authorized the software and released  
10          the support of obtaining it.  I don't recall him  
11          training me at GMS at the time, I think that was  
12          the software.

13      Q.    So you took some online computer courses and you  
14          said that Mr. Boese got you some software.  
15          Would you have worked together on modeling while  
16          you were at GMD2 with Mr. Boese?

17      A.    Sure.  I think at the time, and this is going  
18          way back, but I think the best scenario we came  
19          up, if we had a permit issue or something like  
20          that, he would give me the inputs to say here's  
21          kind of what we are thinking, here's how we want  
22          to simulate it, might have helped to develop the  
23          rates to a nearby well, something on that order.  
24          And I would have run the software that would  
25          have been the general characterization how that

1 would have worked.

2 Q. Is it a fair characterization that you would  
3 have worked together on modeling that would  
4 occur at GMD2?

5 A. Sure. He was a manager and would be informed of  
6 what I was doing at that time, sure.

7 Q. With your experience with Mr. Boese, was he also  
8 experienced in understanding models and in  
9 modeling, was that your experience with Mr.  
10 Boese?

11 A. I am not going to speak to his credentials on  
12 modeling, or his individual, I mean, I am not  
13 going to say what he is qualified or his  
14 experience is. If you wanted to ask him  
15 certainly you will probably have the opportunity  
16 to. All I can say is that I certainly  
17 coordinated as his staff person with him on  
18 modeling.

19 Q. And I am just asking the question, from your  
20 perspective, I am just asking your opinion, did  
21 it appear to you that Mr. Boese at least  
22 understood modeling in your perception?

23 A. Could you elaborate? Modeling has a couple of  
24 different things to it, are we talking about the  
25 inputs to modeling? The outputs to modeling?

1 How the model works?

2 Q. Did Mr. Boese understand the inputs to modeling?

3 A. I think so. And we are talking about  
4 specifically groundwater modeling; is that  
5 correct?

6 Q. Groundwater modeling, yes.

7 A. The basic terms of what is aquifer permeability,  
8 for example. What is aquifer recharging? Sure,  
9 I think so. Sure.

10 Q. Did Mr. Boese understand how a model would work?

11 A. I don't know if he is familiar with the coding  
12 aspect of it, I don't know that, no.

13 Q. Aside from the coding aspects, would he have  
14 understood the basic mechanics of how a model  
15 would be run?

16 MR. McLEOD: I will object. I don't  
17 think the witness, or anyone, can testify to  
18 what Mr. Boese understood, other than Mr. Boese  
19 who, of course, can.

20 MR. STUCKY: This witness worked for  
21 three years in a close fashion on modeling, I  
22 think he can answer some of these questions.

23 MR. McLEOD: I don't think any degree  
24 of working with somebody puts one in a position  
25 to testify what they understand. It doesn't

1           arise to mind reading and resurrecting the  
2           earlier point made by counsel, this whole line  
3           of questioning is outside anything that the  
4           expert witness has to testify to and has no  
5           relationship to any of his testimony on direct.

6                        THE HEARING OFFICER: I think you  
7           should move on.

8                        MR. STUCKY: Okay.

9           BY MR. STUCKY:

10    Q.    So without any question, further questions with  
11           respect to Mr. Boese, you learned some of the  
12           basics of modeling, at least while you were  
13           employed at the GMD2, would that be a true  
14           statement?

15    A.    Sure. First year out of college, why not.

16    Q.    And during the years that you worked with GMD2,  
17           what work, with respect to modeling, did you do  
18           on the ASR Phase II project?

19    A.    I don't know that I did any modeling on ASR  
20           Phase II with respect to groundwater modeling.  
21           I think I did, maybe at that time, it would have  
22           been very to ASR Phase I would have been active,  
23           so maybe the reviewing the accounting reports  
24           would have been close to modeling anything at  
25           ASR.

1 Q. Who would have done the work on the modeling of  
2 ASR Phase II at GMD2 during that three years  
3 that you were there?

4 A. Again, I don't know that anyone did modeling, if  
5 we are talking groundwater modeling. I don't  
6 recall anyone doing groundwater modeling of ASR  
7 reactions or simulations, I don't think that  
8 occurred when I was there at staff. What I do  
9 remember is stuff like relative to ASR, review  
10 the accounting reports, inputs and outputs and  
11 general coordination with whoever the accounting  
12 person was at that time.

13 Q. After you left the GMD2, well, I will ask it  
14 this way. One other question about GMD2, not to  
15 ask about what Mr. Boese knows, but if Mr. Boese  
16 was to testify that he has knowledge of  
17 groundwater modeling and how modeling works, you  
18 would have no reason to doubt that statement by  
19 Mr. Boese; is that correct?

20 A. I don't know that I can answer that question.  
21 Again, I am not going to speak to another  
22 individual's credentials unless they provide me  
23 a resume saying here's what I worked on, or I  
24 coordinated with those specific projects that  
25 make them qualified.

1 Q. At Burns & McDonnell, who further trained you in  
2 your work in groundwater modeling?

3 A. In general, there were a couple of environmental  
4 geologists that are no longer with the company  
5 that I started with, and other than that it  
6 would have been Paul McCormick and Luca  
7 DeAngelis.

8 Q. How were you trained in the application of  
9 MODSIM?

10 A. So, I never received -- well, MODSIM not  
11 MODFLOW?

12 Q. I will talk about both. First of all, were you  
13 trained in MODSIM?

14 A. I was not trained in MODSIM, however, MODSIM is  
15 a pretty basic, and I think John described it  
16 that way, it was modified from RESNET.  
17 Essentially they are products from one another.  
18 It is a simple way of doing accounting for  
19 reservoir by getting, if you will, if you think  
20 of the Equus Beds as a reservoir, if you think  
21 of Cheney as a reservoir, because it is, and it  
22 is a decision support tool for how you take  
23 water from those resources and incorporate  
24 things like infrastructure, limitations, things  
25 of that nature. So it's really a spreadsheet

1 tool on steroids with a G Y. So it is a fancy  
2 way of saying spreadsheet accounting with tools  
3 to help make it faster for running scenarios.

4 MR. STUCKY: May I approach the  
5 witness, Your Honor?

6 THE HEARING OFFICER: Yes.

7 BY MR. STUCKY:

8 Q. I am going to hand you what has been marked, I  
9 am sorry, not been marked, if I were to proffer  
10 to you, we had a little technical difficulty  
11 over here with some water. It's very  
12 appropriate.

13 If I were to tell you that's your  
14 expert report, would you agree with that?

15 A. This appears to be my expert report, yes.

16 Q. And if you were on the first page, it indicates  
17 what you were consulted to do; is that right?

18 On the very first line.

19 A. First page?

20 Q. First page, first line.

21 A. Sure.

22 Q. What does it say you were consulted to do?

23 A. I will read it for the record. I am on number

24 A, no, letter A, consulted for Equus Beds

25 aquifer water usage consisting of a yield,

1 recharge mechanisms and accounting water  
2 resource conditions and technical tools and  
3 models.

4 Q. In the very second paragraph there is an  
5 indication of what the grounds, and the basis  
6 for your analysis, what it was based on; is that  
7 right? The next paragraph has to do with what  
8 it's grounded on?

9 A. Looking at B?

10 Q. Very next paragraph, B, I assume. Could you  
11 read that next paragraph.

12 A. Sure, I will do that. The grounds for Daniel  
13 Clement's opinions and/or knowledge of pertinent  
14 information presented in City of Wichita's  
15 response to production request of Equus Beds  
16 Groundwater Management District Number 2 and  
17 City of Wichita's responses to Intervenor's  
18 production requests, as referenced in the  
19 summaries of the respective opinions below, and  
20 in several cases excerpted and attached for  
21 convenience of reference. Is that right?

22 Q. That's correct. So is that the entire paragraph  
23 that defines under which the grounds of your  
24 opinion were based on?

25 A. Kind of a legal question that you just asked me,

1 so I will say I believe I read line B  
2 accurately.

3 Q. Are there any other grounds under which it's  
4 indicated, at least in your expert report that  
5 your opinion is based upon? And, if so, can you  
6 tell me where it explains what other grounds  
7 your expert report is based on?

8 A. I believe the entire document that is my  
9 preliminary expert report disclosure here would  
10 describe that, what you asked.

11 MR. STUCKY: May I approach the witness  
12 again?

13 THE HEARING OFFICER: Yes.

14 BY MR. STUCKY:

15 Q. Just a moment ago you testified with respect to  
16 a number of hydrographs, starting with  
17 hydrograph 1. Do you recall that testimony?

18 A. Yes.

19 Q. And it was Attachment I.

20 A. Yes.

21 Q. Could you flip with me to Attachment I and  
22 hydrograph 1.

23 A. I am there.

24 Q. If we were to look at hydrograph 1, would you  
25 agree that with respect to hydrograph 1, is that

1           that depicts an index cell; is that right? Is  
2           my terminology correct there?

3       A.    This is depicting a couple of different things.  
4           Which line do you want me to discuss?

5       Q.    Well, it says an index well hydrograph. So this  
6           is depicting a particular index well, is that  
7           correct?

8       A.    Yes. In this case we are at the location of  
9           index well 1, the blue and green line, I am  
10          trying to be thorough here, represents the  
11          elevation predicted by the model at the location  
12          of the index well within the model.

13      Q.    And index well 1, does the City have a well?

14      A.    Yes. Each index well site there should be at  
15          least, and sometimes there are other wells  
16          nearby, but I believe there is at least an upper  
17          and lower index well. So two separate  
18          monitoring wells.

19      Q.    And I should draw a distinction, in index cell  
20          1, there is at least one monitoring well, is  
21          that what your testimony is?

22      A.    Yes.

23      Q.    Does the City have an actual well where they  
24          could pump water in index cell 1?

25      A.    What kind of well? Municipal well? I am

1           assuming for the purpose of the question, to  
2           speed things up, I assume you are referring to a  
3           municipal well. And the answer is I don't know  
4           without looking at a map. I don't believe so.  
5           I don't believe there is any recovery pumping  
6           structure in 1.

7       Q.   Well, let's flip then to that map that we talked  
8           about represented on, it was Attachment I map is  
9           how it was referred. It showed, showed a  
10          graphical, it shows a spatial depiction of all  
11          of the index wells.

12       A.   The graph, or the figure that I am looking at in  
13          Attachment I, it would be the first page, after  
14          the cover page for attachment I, which has at  
15          the top labeling legend, index well name, (IW-#)  
16          and then in the lower right-hand corner,  
17          simulated drought results, recovery of ASR  
18          credits limited by existing minimum index level  
19          elevations. That figure?

20       Q.   Yes, that figure. In index well 1, are you able  
21          to look at this and determine if there is any  
22          municipal wells in index well 1?

23       A.   According to the map it does not appear that  
24          there are municipal wells, at least city  
25          municipal wells log, which would be blue

1 triangles on this particular map, and there does  
2 not appear to be any index well 1.

3 Q. Are there any wells, well, let's go back to that  
4 hydrograph. Let's go to hydrograph, so with  
5 respect to hydrograph Number 1, you would agree  
6 that this is outside an index cell where the  
7 City actually has a municipal well, is that a  
8 true statement?

9 A. That would appear to be the case.

10 Q. Let's go back to hydrograph Number 2.

11 A. I am there.

12 Q. And I am sorry, to back up on you. With respect  
13 to hydrograph Number 1, you would at least agree  
14 that in the case of your simulation, the average  
15 simulation that you performed as water levels  
16 are pumped down over a course of eight to even  
17 ten years, at least in that situation it doesn't  
18 get close to the 1993 levels; is that right?

19 A. According to the model results, yes, that's  
20 accurate.

21 Q. And, in fact, how far off from reaching those  
22 1993 levels is it in this particular hydrograph?

23 A. So, I am not going to quote exact elevations  
24 here, but it looks like the red line, which  
25 would be the 1993, lower aquifer groundwater

1 elevation, which would represent the current  
2 1993 elevations, would be the red line, and it  
3 would be roughly 1415. And it looks like the  
4 lowest we get is 1430, according to the model.  
5 So that would be a delta of 15 feet.

6 Q. So if we were just focusing graphically only on  
7 hydrograph 1, hydrograph 1 couldn't cause any  
8 concern for you as far as the fact that the City  
9 would not be able to recover recharge credits in  
10 the time of drought as it relates to the 1993  
11 level, is that a true statement?

12 A. Well, I think you would have to ask the City,  
13 the owner of the project, whether they would be  
14 concerned. That would be my answer, if you are  
15 going to use the word concern.

16 Q. But if you were advising the City, as far as  
17 whether or not the 1993 levels would be reached  
18 with respect to the index cell depicted in  
19 hydrograph 1, your answer would be no; is that  
20 correct?

21 A. Based on the model results, that would be  
22 correct.

23 Q. You next talked, well, let me back up just a  
24 moment. With respect to all of these  
25 hydrographs, did you help to generate these

1 hydrographs?

2 A. Yes.

3 Q. And did you help to do the calculations in these  
4 hydrographs?

5 A. Yes. Everything was probably, well, everything  
6 was done on an Excel spreadsheet.

7 Q. Were these hydrographs based on simulated  
8 results?

9 A. Yes. And I will be specific, that the plot of  
10 the groundwater elevation, respective to each  
11 hydrograph for IW1A and IW1C, as an example,  
12 those are plot models for the stress periods.  
13 Those are predicted results. If you want to  
14 look at things like relative percent full, those  
15 are things based on are observed, however, it  
16 does include the calculation of the groundwater  
17 elevation predicted in those. In other words,  
18 some of the things that are in here are  
19 predicted, and others are observed things like  
20 bedrock elevation, things that would be in the  
21 model, of that nature, of things that don't  
22 change, so no simulation.

23 Q. So the bed rock elevation shown as zero in  
24 hydrograph 1, that was predicted based on the  
25 model, if I understood your testimony?

1 A. So the relative percent full here, yes, it is  
2 based on the model which is based on drilling  
3 logs and things of that nature to determine  
4 bedrock elevation for this particular index  
5 cell. And then also percent full condition was  
6 based on an interpolation of observed results by  
7 USGS for predevelopment levels. And again, the  
8 relevant percent full is based on the relative  
9 condition to those predevelopment levels. And  
10 we calculate that against the saturated  
11 thickness based on the predevelopment and  
12 bedrock elevation as determined by the model.

13 Q. Just so I am clear, someone from USGS would have  
14 come up with the determination of where the  
15 bedrock is with respect to this modeling?

16 A. That's correct. The model contains bedrock  
17 elevations that were interpolated from available  
18 data, like drilling logs, that is distributed  
19 throughout the model, and that's the genesis of  
20 the bedrock within the model.

21 Q. Just so I am clear, you didn't actually look at  
22 any kind of drilling logs or any kind of  
23 baseline data of that sort to try to determine  
24 what that bedrock elevation should be; is that  
25 correct?

1 A. No. I used the values here that were within the  
2 USGS model.

3 Q. Let's move on to hydrograph 2.

4 A. I arrived at hydrograph 2.

5 Q. With respect to hydrograph 2, does hydrograph 2  
6 also depict an index cell that's outside of the  
7 pumping area of the City? And you can reference  
8 that map to answer that question.

9 A. (Witness reviews documents). It looks like  
10 hydrograph 2 does have, I don't know that it's a  
11 city pumping well, but it looks like there is at  
12 least one triangle in index cell number 2,  
13 roughly in the middle of that cell.

14 Q. Do you know if that's a Phase I or Phase II  
15 well?

16 A. I believe it is a Phase I well there.

17 Q. With respect to hydrograph number 3 that you  
18 testified to. Hydrograph number 3.

19 A. Okay.

20 Q. Can you explain in hydrograph number 3 why the  
21 water level starts below the 1993 level.

22 A. It may have just been a function of their  
23 simulated heads at that particular location. I  
24 don't have an explanation for it. I haven't  
25 gone in to detail and checked it.

1 Q. Has anyone on in your team, and when I say your  
2 team I am saying consultants with Burns &  
3 McDonnell or the City, has anyone gone in to try  
4 to determine why the water level would start at  
5 that level?

6 A. No, not that I know of, not currently, no.

7 Q. Is hydrograph number 3, is that also outside any  
8 area where there is a municipal well?

9 A. I believe the diversion wells are in that cell,  
10 but relative to city production, I am showing  
11 three triangles there, I believe those to be  
12 diversion wells and not pumping wells. I don't  
13 know that there is any municipal infrastructure  
14 there in number 3.

15 Q. When you were testifying as to hydrograph number  
16 3, you were asked the question if one could  
17 theoretically, if the City could theoretically  
18 pump water out of that particular index cell,  
19 and I think your testimony was, if the  
20 infrastructure existed, yes, you could. When  
21 you said that, what infrastructure were you  
22 referring to?

23 A. So I believe that was a hypothetical, so I  
24 assumed hypothetically there was infrastructure  
25 there, all things aside we could do it. So

1 hypothetically you could. If you put a well in  
2 the ground and want to pump water out of it, so  
3 yes.

4 Q. So in this hypothetical, the infrastructure  
5 needed would be an actual well, an actual  
6 pumping well?

7 A. That's generally how you get water out of  
8 ground, using a well, yes.

9 Q. Just so I am clear. Now, on hydrograph number  
10 4.

11 A. Okay.

12 Q. Hydrograph number 4 you would also agree that at  
13 least as the modeling relates to hydrograph  
14 number 4, the water level would never go, the  
15 actual water level that was modeled never go  
16 below the 1993 level. Is that a true statement?

17 A. Based on the red line permit level, you are  
18 talking about the 1993 level there, that would  
19 be accurate according to the model predictions.

20 Q. Without, well, do you know off the top of your  
21 head with respect to how many of these  
22 hydrographs were generated, how many of them the  
23 actual water level doesn't go below the 1993  
24 level?

25 A. I believe that was represented in one of the

1 figures we just talked about that showed the  
2 number of wells that did or didn't occur  
3 according to simulations. I assumed that was  
4 the question. Based on the model results which  
5 index cells have an occasion, somewhere within  
6 the drought model, where they showed that they  
7 dropped below the 1993 permitted levels. That  
8 would be represented in one of the figures. And  
9 I believe the figure we were just previously  
10 talking about with the map. I don't have a  
11 count, but you could count from that.

12 Q. Can you count for me and quickly answer that  
13 question? Or would that take a little bit more  
14 of your time?

15 A. (Witness reviews document). I counted twice and  
16 counted 21.

17 Q. And do you know, out of, I think this is going  
18 to be an easier question for you to answer, out  
19 of how many index cells?

20 A. There are 38 within the basin storage area.

21 Q. So over half, just so I am clear, over half,  
22 within over half of the index cells, the water  
23 level does not get below the 1993 level, is that  
24 a true statement?

25 A. Yes, statistically.

1 Q. So with respect to at least over half of those  
2 index cells, if we were to exclude just those 21  
3 index cells, and you are advising the City with  
4 regard to whether or not it's a concern that  
5 water levels could drop below the 1993 levels,  
6 with respect to those 21 cells at least, you  
7 would have to advise the City that they would  
8 not drop below the 1993 levels; is that correct?

9 A. Well, it depends on the advice I would be giving  
10 the City. Anything you do in municipal industry  
11 you always want to keep in mind future planning.  
12 So in that relative sense, I would look at  
13 places that I wouldn't anticipate putting  
14 perhaps additional infrastructure, additional  
15 ASR infrastructure, additional municipal wells  
16 and consider it in that, that circumstance.

17 So if I had an area, let's say, in the  
18 core of the well field where I had an  
19 opportunity to ASR infrastructure, or something  
20 of that nature, it might change my decision on a  
21 recommendation for or against considering  
22 whether 1993 levels would be an issue or not an  
23 issue, even with predicted models.

24 Q. Mr. Clement, I certainly can appreciate and  
25 understand the fact that future changes in

1 infrastructure and future changes in planning  
2 can change a result; but I am speaking to only  
3 what was specifically modeled and depicted in  
4 those hydrographs. As it was only modeled and  
5 depicted in those hydrographs, with respect to  
6 21 out of 38 of those index cells, the modeling  
7 would show that the actual water levels, when  
8 the City recovers recharge credits, would not  
9 drop below the 1993 levels. Is that correct?  
10 Or recovers its water rights; is that correct?

11 A. Sure. And I will try to state it relative to  
12 this specific situation. If the City took the  
13 credits in the manner that's prescribed by the  
14 current model that we use illustrated within the  
15 proposal, the water levels would not drop below  
16 the levels that are illustrated in the figure  
17 that we have just previously discussed, the 1993  
18 levels. I hope that answers your question  
19 relative to the number you put out of 21 versus  
20 the 38.

21 Q. I think it does. So with respect to 21 out of  
22 38, it would not drop below the 1993 levels?

23 A. Correct.

24 Q. You indicated in your testimony just a moment  
25 ago, that you were also referring to an

1 attachment I on the map, you said that some well  
2 areas are safe. End quote. Were you referring  
3 to the fact that with respect to 21 of those  
4 index cells they are safe from dropping below  
5 the 1993 levels? I was just unclear on what  
6 your testimony meant in that regard.

7 A. And maybe, I don't recall, maybe I said it, but  
8 I don't know that I remember saying safe. So in  
9 the instance, and I think you said your question  
10 relative to the index cell does not drop below,  
11 simply put, in my opinion I wouldn't say they  
12 were safe, they just don't drop below. If that  
13 helps clarify what I meant by safe.

14 Q. You were also indicating in your testimony  
15 something about redistributing city pumping and  
16 how that could impact the results of the  
17 modeling, I think. Was that your testimony?

18 A. Sure, yeah.

19 Q. Tell me exactly how, first of all, what is meant  
20 by redistributing of city pumping?

21 A. So right now on the model we assume that  
22 recovery of credits happen in a certain way  
23 distributed to all of the pumping wells  
24 essentially that would be available to pump  
25 recharge credits based on their ability to

1 recover 40,000 acre feet in terms of rate. So  
2 stronger pumpers, individual wells within the  
3 city, would potentially pump more recharge  
4 credits than others that are weaker wells,  
5 lesser gallons per minute. If that makes sense.

6 So there may be, just from general  
7 operations, all wells are not available 100% of  
8 the time. There isn't a well field that occurs  
9 hundred percent of the time. Lightning strikes,  
10 all sorts of things happen. They are not  
11 perfect. Also you can have a redistribution,  
12 basically a redistribution of pumping, what  
13 could occur a shift in pumping from normal  
14 operations, some wells be down, for whatever  
15 reason, and that could occur.

16 So relative to your question, and in  
17 context as to what it means for the proposal and  
18 why we said that, it would have been cells like  
19 32 or 33, which do have municipal pumping in  
20 them, but didn't necessarily drop below the  
21 levels. So if we saw a shift to additional  
22 pumping in those well sites, for whatever  
23 reason, that would be an additional thought for  
24 the shift in pumping and still be somewhat  
25 concerned about what levels mean for those

1 specific index cells.

2 Q. Did you model for any of that redistribution of  
3 pumping and play with any of the variables to  
4 account for that?

5 A. We didn't. How we handled that in the proposal  
6 was to tack on additional contingency to allow  
7 for that potential redistribution. Doesn't mean  
8 it will happen, but from a planning standpoint  
9 we wanted to say it could happen. Kind of like  
10 a weatherman predicting it is going to snow six  
11 inches tomorrow. If he says eight inches and it  
12 snows six, it is probably okay. If it snows 32  
13 and he said it would snow six, everyone is  
14 going, what the heck. So we wanted to make sure  
15 we do it right, and that's one of things we  
16 wanted to add is a contingency, not only by the  
17 City, but by ag and other interests.

18 Q. Let's move on to table 2-10 in the proposal.

19 A. Can you direct me what page that's on in the  
20 proposal?

21 Q. It looks like 2-24.

22 A. I have arrived.

23 Q. All right. Just a moment ago you were asked by  
24 Ms. Owens whether there were some errors in this  
25 particular table. And I think your answer was

1           there were at least a couple of errors; is that  
2           correct?

3       A.   That's correct.  It appears that there were  
4           clerical or typo errors, specifically in the  
5           contingency added column for IW01 and IW02.  
6           Those particular rows.

7       Q.   And IW01 in the contingency it says 20 feet.  As  
8           you are sitting there right now, do you know  
9           what the actual number should have been?

10      A.   It would have been the delta, I believe we chose  
11           existing at that site, so the difference between  
12           1413.42 and 1390.

13      Q.   What was that result?

14      A.   Let's see, it would be, it looks like 23.42 of  
15           we are on 1390.

16      Q.   And with respect to the very next line can you  
17           tell me what that Number 10 should be replaced  
18           with, if this table would have been corrected?

19      A.   It looks like 20.52.

20      Q.   So this leads me to a question, at least with  
21           respect to the first two numbers in the result  
22           that you told me there was a decimal on each of  
23           those numbers, is that, would that be a true  
24           statement?

25      A.   There are decimals on the first two columns,

1           that is correct.

2       Q.    But on these contingencies that were added, were  
3           any of those decimals included?

4       A.    Off the top of my head, I don't know.

5       Q.    At least no decimals were shown on this  
6           particular table; is that right?

7       A.    That's correct.

8       Q.    Are you aware of any other errors that exist on  
9           table 2-1?

10      A.    Not currently.

11      Q.    You were explaining a moment ago why a ten foot  
12           contingency was added on table 2-10. Can you  
13           specify to me why, for example, a ten foot  
14           contingency would be added?

15      A.    Sure. Sure. That would be a combination of the  
16           things we just talked about from potential  
17           municipal redistribution. So the pumping from  
18           the City of Wichita was redistributed to ASR,  
19           recovery happened in a different fashion than  
20           what actually occurred as predicted in the  
21           model. That would be one change. Another  
22           consideration we saw in 2011 and 2012 extensive  
23           over pumping by some agriculture, not all  
24           agriculture. And also the inclusion of  
25           multiyear flex account. So on top of the City's

1           pumping we can also see additional flexibilities  
2           that are not accounted for within at least this  
3           projected model, that could come from the other  
4           users in the aquifer. And so that is the  
5           genesis of ten feet. And it also allowed for  
6           some flexibility between the proposed conditions  
7           as respected to the model projected levels based  
8           on model output results, just not being decimal  
9           precision.

10        Q.    Awhile ago a letter from Mr. Barfield was  
11           introduced in to evidence. And if I were to  
12           tell you that Mr. Barfield referred to that ten  
13           foot contingency as a safety net, does that  
14           terminology, does that resonate with you as far  
15           as terminology that has been used to describe a  
16           contingency?

17        A.    I think that's a fair characterization of what's  
18           being implied here. We have either the existing  
19           levels or the model levels buffered by ten feet  
20           of contingency, in general; and that ten feet  
21           is, if you will, if you want to use safety net,  
22           a safety net for things we may not have thought  
23           of at this point in time. Since we are thinking  
24           for the year 2060 we want to be prepared for  
25           those things in contingency.

1 Q. At least with respect to the years 2011 and  
2 2012, were multiyear flex account popular at  
3 that time?

4 A. I believe it began with drought term permits and  
5 rolled over in to multiyear flex accounts. I  
6 think that's generally, yes, they were pretty  
7 popular. Depends on the user and how those who  
8 were in noncompliance and how they were  
9 distributed at the time, an individual's  
10 decision on how they wanted to operate their  
11 particular center pivot or their particular  
12 water right, but they were, I would say, fairly  
13 popular.

14 Q. Now, the contingencies that you put in that  
15 table, table 2-10 are relatively constant; is  
16 that right? Relatively constant contingencies?

17 A. Yes, ten is ten is ten throughout, yes.

18 Q. But with respect to if one were trying to  
19 account, for example, a MIFA, a multiyear flex  
20 account, it could create a lot more variability  
21 in that number, is that a true statement?

22 A. I don't know whether it would go up or down. It  
23 would just create too many model iterations to  
24 be like humanly, physically possible. If you  
25 figure out how many water rights are inside the

1 central well field storage area or even the  
2 basin storage area and try to decide what an  
3 individual user may or may not, you would end up  
4 with pretty much an infinite loop of never,  
5 never coming to a decision on or what levels to  
6 model. So this is a general reflection of what  
7 may happen in a reasonable number that we think  
8 is ten.

9 Q. But the City didn't try to specifically account  
10 for actual data in a multiyear flex account in  
11 the contingencies in the model; is that correct?

12 A. That was not a specific model run.

13 Q. Was there enough data, hypothetically speaking  
14 from 2011 and 2012, that if the City had wanted  
15 to account for variables such as that, the City  
16 could have done further modeling to account for  
17 those variables?

18 A. I am going to say no. Because I kind of  
19 understand what it would take to take that on,  
20 and I will go through the variables that I think  
21 would occur during that type of valuation for  
22 general characterization. You have to think of,  
23 okay, why would an individual water user and ag  
24 user apply for a multiyear flex account, it  
25 would be, number one, you need to pump your

1 water in excess of what your annual allotment  
2 is. So we would have to assume, number one,  
3 that they would want to do that and not stop  
4 pumping or perhaps collect insurance or whatever  
5 they want to do on an individual basis. That  
6 alone trying to predict what an individual would  
7 or would not do would get in to a realm of  
8 uncertainty. I wouldn't recommend doing it.

9 The nice thing that's already inside  
10 of the model results that are predicted, is we  
11 do have the affects of any drought pumping that  
12 occurred in 2011 and 2012. So it does reflect  
13 actual ag demand, or at least a response to the  
14 hydrologic conditions that were part of 2011 and  
15 2012, which were very dry. So we would expect  
16 that to continue to occur, and multiyear flex  
17 accounts would, if anything, continue to  
18 facilitate more of that.

19 Q. You testified a moment ago on table 2-1 that, in  
20 table 2-10 that in some cases you picked the  
21 existing level number. There was some sort of  
22 testimony, and I was unclear on it, where you  
23 picked a higher number for part of your  
24 analysis. Do you recall any of that testimony?

25 A. I don't remember. You will have to refresh my

1 memory if you want to ask that question.

2 Q. I will move on. I got that out of context.

3 Let's go ahead and move to table 2-11. I will  
4 walk through table 2-11 in detail. I have a  
5 number of questions about table 2-11. Just so I  
6 am clear, this 1390 number in index cell numbers  
7 1 and 2, under the proposed levels, just so I am  
8 clear with your testimony, although there were  
9 errors in the contingency, is your testimony  
10 that those numbers, with respect to the two  
11 numbers of 1390 are correct?

12 A. Those are the proposed levels for those two  
13 proposed index cells, yes.

14 Q. And also so I am clear, are you aware of any  
15 errors in this particular table?

16 A. Not that I am aware of.

17 Q. And I think what you said is that this table  
18 purports to show a saturated thickness in each  
19 one of the index cells. Is that your testimony?

20 A. Yes.

21 Q. But again, this particular saturated thickness  
22 is based on the computer modeling; is that  
23 correct?

24 A. Yes.

25 Q. And, in fact, the saturated thickness is not

1 based on any kind of actual measurements that  
2 either you, or any one of the consultants with  
3 the City took, or the City themselves took; is  
4 that correct? That was a very compound  
5 question. Let me back up.

6 This saturated thickness isn't based on  
7 any personal measurements that you took; is that  
8 right?

9 A. That's correct.

10 Q. And it's not based on any measurements that any  
11 of the consultants, that are sitting here in  
12 this room for the City took; is that correct?

13 A. That's correct.

14 Q. And it's also not based on any measurements that  
15 were taken by the City; is that correct?

16 A. So we are talking about simulation here, so you  
17 can't measure the future, so we are not, that  
18 would be impossible. So I will just  
19 characterize what the data is, and hopefully  
20 that answers the anticipated line of questioning  
21 here.

22 Just so we are clear, the proposed  
23 level remaining aquifer saturated thickness is  
24 the model average for the entirety of index well  
25 or index cell 1. That geographic boundary area

1           that is shown in figure 11 on the next page. It  
2           is that, that is the average saturated thickness  
3           of that particular cell, based on the model.  
4           And the model is based on a number of  
5           observations from drilling logs and other  
6           things, which is in the documentation of the  
7           USGS report.

8       Q.    If the City had hired consultants, for example,  
9           to have, to generate drilling logs, let's say,  
10          would that be reliable numbers to try and  
11          predict actual baseline for the bedrock and the  
12          aquifer?

13     A.    You could. If you wanted to do a hydro geologic  
14          investigation, or just perhaps query the wells  
15          in that cell, and come up with your own  
16          interpolated surface, you could do that.

17     Q.    Did any one of the City or City's consultants do  
18          that work?

19     A.    No, not that I know of.

20                       MR. STUCKY: Do you want me to proceed?  
21                       I have been told we were supposed to be out of  
22                       here at five.

23                       THE HEARING OFFICER: Oh, my goodness.  
24                       Well, I don't think you will be done in ten  
25                       minutes or even 40 minutes; is that correct?

1 MR. STUCKY: I am afraid that's a true  
2 statement.

3 THE HEARING OFFICER: So unless we want  
4 to go on indefinitely, which I guess we aren't  
5 allowed to do, we probably should just come to a  
6 close. It's an awkward place to have to cut it  
7 off, but it is what it is. So...

8 MR. STUCKY: I am just noting that the  
9 pastor is standing in the room.

10 THE HEARING OFFICER: Yes. I think you  
11 are right.

12 THE PASTOR: I am not kicking anybody  
13 out, if you need more time take what you need.  
14 But if you need a stopping point, I will tell  
15 you to get out.

16 THE HEARING OFFICER: We'll go off the  
17 record for a second.

18 (A short off-the-record discussion  
19 was held at this time.)

20 THE HEARING OFFICER: Back on the  
21 record. Unfortunately the constraints of time  
22 and travel needs require us to recess the  
23 hearing at this point. It is almost 5:25 in the  
24 evening. We'll have to have continue with Mr.  
25 Clement, and with this hearing, at a future date

1 that will be announced later.

2 So this formal phase of the hearing for  
3 the Wichita ASR Phase II Modification Request is  
4 being paused. It will be continued at future  
5 dates.

6 However, the public comment period for  
7 tomorrow will take place. That's Friday morning  
8 December 13 from 9 to 11 tomorrow morning. I  
9 will be here.

10 There will also be a subsequent public  
11 comment period later after this hearing is  
12 eventually concluded. So my announcement that  
13 the record would officially close on January 17  
14 is withdrawn. That is not the final date for  
15 the record to close any longer.

16 Is there anything else that I need to  
17 mention before we wrap up?

18 MR. OLEEN: I would like to mention to  
19 those that might be interested in learning when  
20 this will actually be continued, the quickest  
21 way will be from the DWR website on this matter.  
22 As soon as we decide on a date that will be  
23 disseminated in various forms, but the quickest  
24 it will be posted will be on the website for  
25 this matter.

1 THE HEARING OFFICER: Thank you. The  
2 updates will be on the DWR website. And thank  
3 you to everyone. And safe travels.

STATE OF KANSAS )  
                          ) ss:  
SEDGWICK COUNTY)

I, Rachelle Smith, a Certified Shorthand Reporter within and for the State of Kansas, certify that the foregoing is a full and correct transcript of all the oral evidence and oral proceedings had in this matter at the aforementioned time and place.

IN WITNESS WHEREOF, I have hereunto set my hand and official Kansas registration information at Wichita, Kansas.

Certified Court Reporter registered with the Kansas Supreme Court, No. 0864. Expires June 30th, 2020.

/S/ Rachelle Smith, CSR

1 **PRESIDING OFFICER:** Okay. We are  
2 now on the record. Today is February 10,  
3 2020, and the proceedings today are a  
4 continuation of a hearing that began in  
5 December and was conducted on December 10,  
6 11, and 12, 2019. And the caption of that  
7 is State of Kansas, Before the Division of  
8 Water Resources, Kansas Department of  
9 Agriculture, in the Matter of the City of  
10 Wichita's Phase II Aquifer Storage and  
11 Recovery Project in Harvey and Sedgwick  
12 Counties, Kansas, Case Number 18 WATER  
13 14014.  
14 I'll just briefly refer to some  
15 preliminaries; we went through the complete  
16 preliminaries last time, and those are a  
17 matter of record. The formal parties are  
18 the City of Wichita, Kansas Department of  
19 Agriculture's Division of Water Resources,  
20 Equus Beds Groundwater Management District  
21 No. 2, and the following individuals who  
22 will be collectively referred to as the  
23 Intervenors, Richard Basore, Josh  
24 Carmichael, Judy Carmichael, Bill Carp,  
25 Carol Denno, Steve Jacob, Terry Jacob,

Page 812

1 Michael J. McGinn, Bradley Ott, Tracy  
2 Pribbenow, and David Wendling.  
3 As for public comments, public comments  
4 are welcome in writing. We will not have a  
5 designated time during this visit to have  
6 public comments orally, but public comments  
7 may be submitted in writing today or after  
8 today. The close of the opportunity for  
9 public comments won't begin until 30 days  
10 after this hearing is finally concluded.  
11 So we don't know yet when that date will  
12 be, but that is at some point in the  
13 future.  
14 Public comments can be handed to a DWR  
15 staff today or directly to me when we're on  
16 a break or sent to the Division of Water  
17 Resources, either as an email or in  
18 writing, snail mail, and those directions  
19 are on the DWR website.  
20 So to get started, may we have  
21 appearances, please.  
22 **MR. MCLEOD:** Brian McLeod for the  
23 City of Wichita.  
24 **MR. OLEEN:** Aaron Oleen for the  
25 Division of Water Resources.

Page 813

1 **MR. ADRIAN:** And Tom Adrian and Dave  
2 Stucky for Equus Beds Groundwater  
3 Management District.  
4 **PRESIDING OFFICER:** Thank you.  
5 **MS. WENDLING:** Tessa Wendling for  
6 the Intervenors.  
7 **PRESIDING OFFICER:** Thank you very  
8 much. And please correct me if I'm wrong,  
9 but I think where we left off was we were  
10 in the middle of Daniel Clement's  
11 testimony. Is that your recollection,  
12 Mr. McLeod?  
13 **MR. MCLEOD:** I believe Mr. Stucky  
14 was in the process still of cross-examining  
15 Mr. Clement.  
16 **PRESIDING OFFICER:** Thank you very  
17 much. Mr. Stucky, are you ready to resume?  
18 And, Mr. Clement, you are still under oath  
19 from last time. I don't know if we need a  
20 microphone moved over for counsel's  
21 questions so the court reporter can hear.  
22  
23 DANIEL CLEMENT,  
24 having been previously sworn, was  
25 examined and testified as follows:

Page 814

1 **PRESIDING OFFICER:** You may go  
2 ahead.  
3  
4 **CROSS-EXAMINATION (Cont.)**  
5 **BY MR. STUCKY:**  
6 Q. All right. Mr. Clement, last time I asked you a  
7 series of questions about your direct  
8 examination, and I'm going to try really hard  
9 not to duplicate any of those questions, but  
10 it's been a long time and I apologize if I do.  
11 But to start out, in your CV, in your resume,  
12 you note that you do water right consulting; is  
13 that correct?  
14 **A. Yes, that is correct.**  
15 Q. And so as a part of that water right consulting,  
16 you have an understanding of the nature of water  
17 rights; is that correct?  
18 **A. In general, as it applies to the State of Kansas**  
19 **for groundwater and generally surface water,**  
20 **yes.**  
21 Q. And, in part, did you learn about the nature of  
22 a water right while you were employed for the  
23 Equus Beds Groundwater Management District?  
24 **A. Sure. Straight out of college, I didn't have**  
25 **very much knowledge of what a water right is or**

Page 815

1 **how water rights worked in the State of Kansas,**  
 2 **so GMD was absolutely my introduction into that,**  
 3 **so yeah.**  
 4 Q. Okay. And last time I asked you about your  
 5 knowledge of hydrology and the training you  
 6 received at the Equus Beds, and I am not sure  
 7 that that conversation went anywhere, but I'm  
 8 going to ask you a different question. At least  
 9 as it relates to water rights and your knowledge  
 10 of water rights, did Mr. Boese help to train you  
 11 as far as what a basic understanding of water  
 12 rights is?  
 13 **A. Sure. I mean, he was the manager and I was the**  
 14 **hydrologist in that position, and never having**  
 15 **worked with Kansas water rights, yeah, he -- he**  
 16 **spent sometime making sure that I understood**  
 17 **what I was working on and understood the K.A.R.s**  
 18 **or the specific Equus Beds regulations at the**  
 19 **time that we were reviewing, sure.**  
 20 Q. So at least at that time, was it your belief  
 21 that Mr. Boese had an understanding of water  
 22 rights and their components?  
 23 **A. He is the manager of the GMD, so I would hope**  
 24 **that he understands the applicatory rules and**  
 25 **regulations that are essentially what he is**

Page 816

1 **covering and what he is taking care of as the**  
 2 **GMD manager, so I would hope so in his role.**  
 3 Q. And so just to clarify, is your answer yes then?  
 4 **A. That another individual understands --**  
 5 Q. That from your knowledge and experience with  
 6 Mr. Boese, he understood water rights and the  
 7 regulations and statutes that govern them?  
 8 **MR. MCLEOD:** I will object to that  
 9 as phrased because, again, I don't think  
 10 the witness can testify to what another  
 11 individual understands or understood.  
 12 **PRESIDING OFFICER:** Could you  
 13 rephrase the question, please.  
 14 **MR. STUCKY:** Yes.  
 15 **BY MR. STUCKY:**  
 16 Q. From your time having been employed at the Equus  
 17 Beds Groundwater Management District and based  
 18 solely on your knowledge of Mr. Boese and what  
 19 he told you and what he related to you and how  
 20 he conducted himself at the Equus Beds, is it  
 21 your belief that Mr. Boese has a understanding  
 22 of water rights and also an understanding of the  
 23 statutes and regulations that govern them?  
 24 **A. So -- so I will -- I will speak -- see if I can**  
 25 **speak this way. I mean, in the terms of the**

Page 817

1 **rules and regulations and how my role and**  
 2 **Mr. Boese's role interacted, Mr. Boese's role,**  
 3 **again, was manager and mine was hydrologist.**  
 4 **And so we work with the Division of Water**  
 5 **Resources, they would give us an application to**  
 6 **review, whether it's a change application or a**  
 7 **new application, and Mr. Boese's role and my**  
 8 **role would have been to apply the local**  
 9 **Groundwater Management District rules and**  
 10 **regulations as they were written.**  
 11 **So when I was reviewing an application or**  
 12 **when Mr. Boese would often review an**  
 13 **application, he would have the rules and**  
 14 **regulations often on one side of his desk and**  
 15 **then the application on another side of his desk**  
 16 **for an example on how we would review an**  
 17 **application.**  
 18 **So you're literally just taking, let's say,**  
 19 **for instance, spacing, will a water well or**  
 20 **proposed water well meet spacing, so a quarter**  
 21 **mile for a non-domestic well. You can simply**  
 22 **read the regulation that says it is a quarter**  
 23 **mile and apply that rule, I think, in general**  
 24 **crayon or basic terms or simple math to say does**  
 25 **this meet or does it not meet that specific**

Page 818

1 **regulation. So in those terms, yes. In -- in**  
 2 **the legal aspects of statute, outside of that,**  
 3 **I -- I won't be able to speak to that.**  
 4 Q. Okay. Now, earlier, there was discussion about  
 5 how, at least in the past, the City, and when I  
 6 say the past, we're talking about the early  
 7 1990s and that period, there was a discussion  
 8 about how the City of Wichita was off on some of  
 9 their projections, not only for water use  
 10 demands but population growth. Do you recall  
 11 some of that discussion from earlier?  
 12 **A. Sure.**  
 13 Q. Okay. And did -- did you account in your  
 14 modeling for the possibility that some of the  
 15 population trends and some of the population  
 16 models may change over time?  
 17 **A. Yes, insofar that I believe the medium growth**  
 18 **population used by the City. Me personally, I**  
 19 **did not -- I did not do the growth projections,**  
 20 **that was the City's role to provide us with the**  
 21 **numbers that they believed would be reasonable**  
 22 **demands for the year 2060. So I did not**  
 23 **personally create those numbers.**  
 24 **Do I believe those numbers to be reasonable**  
 25 **and reasonable in line with other municipal**

1 **planning, other municipal planning that I've**  
2 **done in terms of reasonable growth rates that**  
3 **you want to assume for not only growth that you**  
4 **need to have the water supply for but also**  
5 **planning in terms of infrastructure and the**  
6 **associated costs with that. You're looking at**  
7 **20 years plus, at least, for funding for some**  
8 **communities, if not beyond. So understanding**  
9 **that you want to be able to plan for not just**  
10 **20 years but 40 years would even be more common,**  
11 **if not further, for a large municipality such as**  
12 **the City of Wichita, I think that's appropriate.**  
13 **Hopefully, that answered your question.**  
14 Q. Yeah. And just to clarify, at least, as the  
15 population projections occurred, you were  
16 relying on the numbers from the City; is that  
17 correct?  
18 A. That's correct, and I -- going back to the issue  
19 of how things might have changed in 1993, just  
20 to reiterate to make sure there is an  
21 understanding there, there was a change in  
22 practice in both use made of water, the  
23 sourcing, and later on a flattening and demand,  
24 as I think Joe and maybe even Don spoke to,  
25 largely due to rates.

1 **During that period, everybody was**  
2 **projecting very, very steep inclines in water**  
3 **demand, and with the advent of things like**  
4 **water-saving toilets, more efficiencies in**  
5 **everything we do in the utility world, we have**  
6 **seen those demands -- demands decrease**  
7 **essentially. And that's not just the City of**  
8 **Wichita, water is getting more expensive**  
9 **worldwide, so that's not a one-off or a single**  
10 **occurrence.**  
11 Q. You just mentioned water efficient toilets a  
12 moment ago, would you agree that as we look to  
13 the next 10, 15, 20 years that appliances will  
14 likely become even more water efficient?  
15 A. I -- I would assume so. I'm not a water  
16 efficiency auditor, but I would hope so. I  
17 mean, that is a good thing all around, more  
18 efficiency, and especially in energy and water  
19 both, that's -- that's an excellent thing.  
20 Q. Does your modeling take into account the  
21 possibility that appliances may become even more  
22 water efficient in the future?  
23 A. No. Again, our model was essentially to take  
24 the Equus Beds groundwater model, we simulated  
25 the demands. Personally, I did not look into

1 **the demands provided by the City. I found that**  
2 **they were reasonable, but I didn't personally**  
3 **perform the projections, so I don't know the**  
4 **different percentages and things that would go**  
5 **into the genesis of that.**  
6 Q. So did you -- I think this question probably is  
7 answered, but does your model take into account  
8 changes in your -- or any of the modeling you  
9 have performed, does it take into account any  
10 changes in infrastructure that may allow for  
11 less water use by the City in the future?  
12 A. No, again, it's the fixed demands that are  
13 within the report in the table. We didn't vary  
14 anything or look at any different scenarios  
15 other than what's essentially provided in the  
16 report in terms of actual municipal demand  
17 because that was what the City provided.  
18 I know the City has done that exercise  
19 trying to understand what if such -- such as if  
20 we did beyond .35 percent reduction, what that  
21 might look like, that's a pretty aggressive goal  
22 since it's recurring, and also how the drought  
23 response plan ties into those demands. That is  
24 factored in -- in our value that we carry within  
25 the model in terms of demand.

1 **So if you can remember Scott Macey's**  
2 **testimony where the MODSIM-DSS model looks at**  
3 **what happens when water levels in Cheney drop to**  
4 **a certain extent, how does that trigger**  
5 **conservation within the City. In that essence,**  
6 **it is represented within our model because the**  
7 **City has provided us those demands which**  
8 **represent conservation and how they think the**  
9 **City will respond in the future with 2060**  
10 **demands relative to the demands of the Equus**  
11 **Beds and the ASR credits. So that would be the**  
12 **extent that those were represented within the**  
13 **model.**  
14 Q. Did you take into account other, better  
15 conservation techniques that might be used in  
16 the future in your modeling?  
17 A. I did not, I was not in charge of the  
18 projections for the City, to generate the  
19 projections to 2060, no.  
20 Q. And you may have partially answered this, but  
21 how -- as you looked at these numbers that were  
22 supplied to you by the City in this regard based  
23 on this line of questioning, how did you  
24 determine that those numbers were reasonable as  
25 you tried to employ them in your modeling?

Page 823

1 **A. I think -- I think as Scott testified earlier,**  
 2 **the original projections were done by SAIC, and**  
 3 **then later there was a review and master plan**  
 4 **performed by, I believe, Burns & McDonnell. In**  
 5 **general, the growth rates -- I've used growth**  
 6 **rates of anywhere 1 to 3 percent, and it also**  
 7 **depends on the industry that you're supporting**  
 8 **and the type of water treatment that you're**  
 9 **doing. So the City's got conventional water**  
 10 **treatment. Other municipalities might be**  
 11 **looking at things like reverse osmosis, which**  
 12 **would increase the total demand because you have**  
 13 **essentially a waste product from that. So I**  
 14 **think the demands as put forward are reasonable**  
 15 **with something that I would put together. While**  
 16 **I didn't do them, I think they are reasonable.**  
 17 Q. So at least, in part, the City's proposal, and I  
 18 think we both know what I'm talking about when I  
 19 say the proposal, correct?  
 20 **A. Yes, the report proposal that is the proposal,**  
 21 **yes.**  
 22 Q. So at least, in part, the City's proposal has to  
 23 do with projections of future water needs and  
 24 how they're going to account for those future  
 25 needs in the way of supplying water; is that

Page 824

1 correct?  
 2 **A. Sure. I -- I think -- the purpose of the**  
 3 **proposal is twofold. The first part of the**  
 4 **proposal is, number one, should the 1993 levels**  
 5 **be lowered. And the purpose of that is what is**  
 6 **a reasonable bottom for the project that can be**  
 7 **established to let the City maintain water**  
 8 **levels actually in higher condition, manage the**  
 9 **aquifer in a more responsible way that would**  
 10 **allow for meeting that 2060 demand. And so**  
 11 **we're talking about what is a reasonable bottom**  
 12 **for the ASR project that allows the City to meet**  
 13 **its drought vulnerability demands relative to**  
 14 **2060, the year 2060.**  
 15 **And the other portion of the proposal is,**  
 16 **of course, aquifer maintenance credits. So we**  
 17 **have a very full aquifer now, it is difficult to**  
 18 **put water into the ground with the existing**  
 19 **infrastructure that we have, so we have an**  
 20 **alternate method essentially of putting water**  
 21 **into the ground by saving it, by not pumping it,**  
 22 **is -- is the second part of the proposal. So**  
 23 **those would be the two elements of the proposal.**  
 24 Q. Okay. I think you mentioned drought planning  
 25 and coming up with water to -- for that drought

Page 825

1 planning in the future through this proposal,  
 2 correct?  
 3 **A. Yes.**  
 4 Q. My question is, and so at least in part as we  
 5 accumulate these credits, where the City can  
 6 accumulate aquifer maintenance credits, they're  
 7 going to be able to, under this proposal,  
 8 accumulate up to 120,000 acre-feet of credits;  
 9 is that correct?  
 10 **A. That is the number in the proposal.**  
 11 Q. So in a sense, they'll be able to acquire these  
 12 gallons in the future, is that -- is that right,  
 13 if they save up these credits?  
 14 **A. Yeah, the idea would be move water from drier --**  
 15 **or wetter years to drier years as the concept of**  
 16 **ASR. So if you're referring to the 120,000 cap,**  
 17 **that would be the cap, the maximum that you**  
 18 **could accrue in terms of ASR credits, whether**  
 19 **they be physical credits or AMCs the way the**  
 20 **proposal is written.**  
 21 Q. Setting aside the City's proposal for a second  
 22 and just based on your knowledge of Kansas water  
 23 regulations, based on your work at the Equus  
 24 Beds Groundwater Management District, is drought  
 25 planning or modeling of drought scenarios

Page 826

1 generally a basis to increase an appropriation  
 2 of water under a water right?  
 3 **A. Well, yes and no. I think it could be used for**  
 4 **flexibilities such as WCA, to understand the**  
 5 **role of multi-year flex accounts, perhaps. I**  
 6 **think modeling can serve a purpose there.**  
 7 **Modeling is served in other portions of the**  
 8 **state, solving very complex issues on water**  
 9 **rights administration. Not only within the**  
 10 **state but in between states. Do I think it**  
 11 **could be used to increase appropriations? It**  
 12 **could be on a new application, let's say, for --**  
 13 **you said to increase the City's existing**  
 14 **appropriations or any users' appropriations?**  
 15 Q. Just in general?  
 16 **A. I think you could -- if you had a model and you**  
 17 **had it available and you wanted to understand**  
 18 **the role of that new appropriation or that new**  
 19 **pumping impact, I mean, that's what a model is**  
 20 **for, sure.**  
 21 Q. And just 'cause we're trying to create a record,  
 22 can you explain what WCA is?  
 23 **A. Water conservation area.**  
 24 Q. And so from your understanding, if a new  
 25 applicant is applying for a water right and this

1 applicant is to say, you know, I've done some  
2 modeling and I believe that in 15 to 20 years  
3 from now I'm going to have some water shortages,  
4 I'm going to have some issues, and I'm going to  
5 need more water, is that a basis to, as you're  
6 applying for a water right, to seek more water  
7 from the get-go?

8 **A. So there's two aspects to that question, one is**  
9 **modeling and one is the water appropriation**  
10 **process. I don't know that they're exclusive.**  
11 **I don't know that they could be -- I mean, they**  
12 **fit nicely together.**

13 **So in the context of a municipality, if**  
14 **we're talking about a new appropriation, I mean,**  
15 **I would encourage a utility to say, look, we --**  
16 **we have a normal demand based on this and a**  
17 **drought demand based on, let's say, some**  
18 **percentage of increase, and understanding that**  
19 **we have to meet not just normal demand but**  
20 **drought demand, should that drought demand be**  
21 **built into the new appropriation request in**  
22 **terms of projections and planning, I would say**  
23 **yes. And could a model serve the purpose of,**  
24 **you know, understanding what that impact could**  
25 **be? Sure.**

1 **quantity, so a bulk quantity of water that,**  
2 **let's say, a City could consume from multiple**  
3 **resources such as Cheney or the Equus Beds or**  
4 **the local well field. And you also would**  
5 **certify or perfect for rate, what does that**  
6 **individual well, what can it physically pump?**  
7 **And so once you become certified essentially,**  
8 **that is -- that is the role of that water right**  
9 **in time for the foreseeable future.**

10 Q. So by way of example, let's say we had a farmer  
11 that applied for a water right, and we have  
12 Mr. Stroberg in the audience, let's say he  
13 applied for a new water right and he said, as  
14 he's applying for this water right, that, you  
15 know, 20 years from now, I think the markets are  
16 going to change and I'm going to want to grow  
17 rice 20 years from now and I'm going to need a  
18 lot more water; but during the five years of his  
19 projection period, it turns out he grows wheat  
20 and he needs less water. Will his total  
21 appropriation be bound by what he -- the water  
22 he actually uses in that five years of  
23 perfection?

24 **A. In theory, it would be bound by the maximum**  
25 **amount of water that he used during perfection,**

1 Q. Now, generally, in Kansas, there's a perfection  
2 period of a water right; is that true?

3 **A. Yes, that's correct.**

4 Q. And is there a perfection period both for an  
5 industrial use or, say, a municipal use or even  
6 an irrigation use, there is a perfection period,  
7 correct?

8 **A. Correct.**

9 Q. And as -- can you explain to the audience what  
10 perfection is?

11 **A. Sure, it is you are certifying that you need**  
12 **that water. The concept of prior appropriation**  
13 **is first in time, first in right, so once you**  
14 **have your spot in line and you have your piece**  
15 **of paper that says you can go forward and pump,**  
16 **whether that be for irrigation or municipality,**  
17 **you have to prove that you need the water that**  
18 **you asked for with that initial request to the**  
19 **State.**

20 **And so that is the role of perfection, you**  
21 **have to perfect both the quantity, you have to**  
22 **pump a given quantity in one year from that**  
23 **particular well, or in the case of**  
24 **municipalities, sometimes you have complex water**  
25 **rights that are intertwined for a larger net**

1 **that would be correct.**

2 Q. So in other words, if he had on one hand the  
3 water he actually used during this perfection  
4 period as he grew his wheat and on the other  
5 hand he had a projection that in 20 years from  
6 now he'd have to use double the amount of water,  
7 his modeling or his projection of what he may  
8 need 20 years from now, that would essentially  
9 be irrelevant in this hypothetical, correct? As  
10 it -- as it relates to the final appropriation  
11 of water in this -- in this water right  
12 hypothetical, right?

13 **A. In this -- yeah, in this hypothetical, if he**  
14 **perfected the right for, let's say, the value of**  
15 **wheat and pumped a certain acre-feet that was**  
16 **perfected and carried that forward, I mean, that**  
17 **would be -- the value of his water right would**  
18 **be that quantity and that rate that was**  
19 **perfected at that time.**

20 Q. So now I want to transition to a municipal water  
21 right, and I understand that instead of a  
22 five-year perfection period, we have a longer  
23 perfection period. Would you agree with that?

24 **A. Yes.**

25 Q. And so let me ask this, that if the City were to

Page 831

1 be applying for a new water right and they had  
 2 projections of their future water demands but  
 3 during their perfection period they only used X  
 4 amount of water but their projection was in the  
 5 future we'll need Y amount of water, if they  
 6 only used X during their perfection period, they  
 7 would still be bound by the number X, in fact,  
 8 what they actually used, correct?  
 9 **A. That's correct.**  
 10 Q. Earlier, we had a discussion regarding the  
 11 recharge capacity of some of the City's wells.  
 12 Do you recall that discussion?  
 13 **A. Yes.**  
 14 Q. And, in fact, and I'm just trying to refresh  
 15 some of my own knowledge, I think that you said  
 16 that there was a minimum recharge capacity of  
 17 the City's wells or infrastructure. Does that  
 18 discussion ring a bell?  
 19 **A. Sure, each one of the City's recharge wells has**  
 20 **a number of down tubes which go down the outside**  
 21 **portion of the casing and then reenter the**  
 22 **casing below water level. They are different**  
 23 **sizes, so in general, I believe the smallest is**  
 24 **maybe 1 inch, something on that magnitude, all**  
 25 **the way up to facilitate additional recharge**

Page 832

1 **rates up to maybe 1,000 gallons per minute.**  
 2 **So the minimum rate for each individual**  
 3 **well site is going to be based on that smallest**  
 4 **down tube, and that is to prevent cascading**  
 5 **in -- of water essentially in that down tube**  
 6 **itself and allow for different rates by simply**  
 7 **regulating the down tube. So if I want to**  
 8 **inject 500 gallons per minute, I don't have to**  
 9 **valve and shear head to do that; I can simply**  
 10 **open a number of down tubes to achieve roughly**  
 11 **that gallons per minute, if that makes sense.**  
 12 Q. Is there a limit as far as the amount of gallons  
 13 per minute that are needed to recharge in some  
 14 of the City's wells?  
 15 **A. Yeah, there is a break over where, let's say,**  
 16 **the smallest down tube only facilitates, for**  
 17 **example, 50 to 100 gallons per minute. If we**  
 18 **can't get that amount of water down --**  
 19 **essentially down the hole, 50 to 100 gallons per**  
 20 **minute, if that was the minimum, that's the**  
 21 **minimum operation point for that well.**  
 22 Q. So in this hypothetical, if we only had  
 23 25 gallons per minute, we wouldn't be able to  
 24 operate that recharge well, is that a true  
 25 statement, in your hypothetical?

Page 833

1 **A. Yeah, and that's, again, based off of the water**  
 2 **level, the head difference between ground**  
 3 **surface essentially and the water level that we**  
 4 **would measure. If we don't have -- if we inject**  
 5 **at a certain rate, as your example, 25 gallons**  
 6 **per minute, and that puts us to 10 foot below**  
 7 **land surface very quickly, then we wouldn't be**  
 8 **able to physically inject. So in other words,**  
 9 **if the minimum infrastructure capacity is, let's**  
 10 **say, 100 gallons per minute, then we can't put**  
 11 **in 25 gallons per minute simply because of that**  
 12 **minimum infrastructure limit.**  
 13 Q. Mr. Clement, in front of you, I think, is a  
 14 black notebook, it appears.  
 15 **A. Okay.**  
 16 Q. And at the beginning of that notebook is the  
 17 City's proposal; is that correct?  
 18 **A. I believe -- I have the proposal, yeah.**  
 19 Q. Could you flip to me -- for me to figure 14, it  
 20 would be on page 3-12 of the proposal?  
 21 **A. Okay, I have arrived.**  
 22 Q. As you just -- based on our discussion we just  
 23 had, could you use some actual numbers from  
 24 figure 14 to explain what you meant about  
 25 minimum GPM as far as the ability to utilize one

Page 834

1 of the City's wells for recharge purposes and  
 2 also the maximum?  
 3 **A. Sure. And I believe we used MR02 and MR04**  
 4 **before, so I think we'll just stick with those**  
 5 **real quick. So this is a example operations**  
 6 **plan in figure 14. The first column is the**  
 7 **recharge well name. So during my time at Burns**  
 8 **& McDonnell, one of the first projects that I**  
 9 **got to work on was being in the field working**  
 10 **with the City's well field and examining**  
 11 **recharge rates at wells. That information is**  
 12 **monitored by a supervisory control -- I forget**  
 13 **the -- the word for SCADA that I can't say right**  
 14 **now, but basically real time monitoring system**  
 15 **for water levels, and there's also an HMI output**  
 16 **in each well house.**  
 17 **And so during the commissioning of ASR**  
 18 **Phase II, I was very much in the field looking**  
 19 **at individual well capacities and also since**  
 20 **that have been accompanying the City on a number**  
 21 **of projects where we look at recharge well**  
 22 **capacity. So this is the genesis of that table**  
 23 **where we understand how the relationship between**  
 24 **groundwater levels and individual recharge well**  
 25 **capacity interrelates. So some wells -- just**

1 like some wells are better pumpers than others,  
2 some wells accept recharge better than others,  
3 and this is what that table is summarizing.  
4 This is an example of an operations plan that  
5 would determine the eligibility of aquifer  
6 maintenance credits.  
7 So let's go over MR02 and MR04, which I  
8 believe was your goal. So in the first column,  
9 that is the static groundwater level measurement  
10 in January of 2016, so this would have been from  
11 city staff going out and actually measuring the  
12 groundwater, I believe, from the top of casing.  
13 Since these are designed and permitted wells, we  
14 have elevations for top of casing, pad site,  
15 things like that, so we have an elevation to  
16 correlate to.  
17 That correlates to a maximum groundwater  
18 elevation at 10 foot below land surface, which  
19 is the next column. So we have effectively,  
20 when we recharge, we have an available water  
21 column. We do not want to operate a well to  
22 reach over 10 feet below land surface within the  
23 actual city well; that is for protection of the  
24 infrastructure at the city site. And there  
25 also, I believe, is a permit condition that

1 regulates that 10 foot to water within a  
2 specific distance, I think it's 660 feet, or  
3 maybe 600 feet, to a specific monitoring well  
4 location that's nearby. So that would be -- the  
5 water column available for recharge in this  
6 example in MR02 would be 23 feet of water column  
7 would be available for us, assuming that 10-foot  
8 depth to water cap.  
9 So we know from the observation data from  
10 this particular well through a multitude of  
11 recharge events since the commissioning of the  
12 plant in 2013, we know that this well does  
13 roughly 5 gallons per minute per foot. So if we  
14 inject 5 gallons per minute, we get roughly a  
15 foot of rise in the well column for this  
16 particular well.  
17 So if you look at the next column, that is  
18 the maximum calculated sustainable recharge rate  
19 based on that 5 gallon per minute per foot  
20 value. We know that this well, with all of the  
21 down tubes open, is rated for, at least  
22 hydraulically, 1,000 gallons per minute. The  
23 minimum well infrastructure recharge rate that  
24 we just talked about, in other words with just  
25 the smallest down tube open, would be

1 125 gallons per minute.  
2 And then that last column would be the  
3 available physical recharge capacity. Since  
4 right now with the specific injectivity, or the  
5 gallons per minute per foot, we only could  
6 inject under this example of January 2016  
7 levels, we would be talking about only being  
8 able to inject roughly 117 gallons per minute  
9 sustainably. Well, the minimum well  
10 infrastructure recharge rate, in other words  
11 with the smallest down tube open, trying to  
12 constrict things down as small as we can get  
13 just to facilitate recharge would be 125 gallons  
14 per minute. So hydraulically, it just doesn't  
15 work at this well, we just don't have enough  
16 room, and we only have 5 gallons per minute per  
17 foot of head at this specific -- specific site.  
18 Conversely, MR04 would be kind of that same  
19 scenario. I'd be happy to go through it if --  
20 if there's value to you or the hearing process  
21 if you want me to continue.  
22 Q. So just so I'm clear, in this chart where it  
23 says available physical recharge capacity and it  
24 has the number zero, what does that mean?  
25 A. That means that 117 gallons per minute is

1 essentially less than the 125 gallons per minute  
2 in the -- in the second-to-last column. In  
3 other words, we can't inject because  
4 hydraulically we can't -- we cannot inject 117  
5 gallons per minute, it will create cascading  
6 issues for us. It's just simply the minimum  
7 down tube size for this particular well.  
8 Q. So let's talk about MR06, you just mentioned  
9 that one. Well, actually, let's -- let's talk  
10 about MR06. You talked about MR04 and MR02.  
11 With respect to MR06, it looks like the minimum  
12 infrastructure required is 150 GPM; is that  
13 right?  
14 A. Yes.  
15 Q. And the maximum is 1,200; is that right?  
16 A. That's correct.  
17 Q. And in that case, the available physical  
18 recharge it has is 162 GPM; is that right?  
19 A. That's correct.  
20 Q. So now let's look at MR0 -- or, I'm sorry, MR55.  
21 It's about one, two, three, four, five, six,  
22 seven up from the bottom of that table.  
23 A. Okay.  
24 Q. With respect to MR55, it has the same maximum  
25 well infrastructure recharge rate which is 1,200

Page 839

1 GPM, correct?  
 2 **A. Yes.**  
 3 Q. But the minimum, which is 225 GPM, is actually  
 4 75 GPM higher than MR06. Is that a true  
 5 statement?  
 6 **A. It has -- yeah, it's 225 off of 150, yeah.**  
 7 Q. So 75 GPM higher. So let's just talk about a  
 8 comparison conceptually of these two wells.  
 9 Let's say that the available GPM for recharge  
 10 purposes was 150 GPM. You would be able to  
 11 operate MR06 under that scenario, correct?  
 12 **A. Yeah, that would be compatible with the minimum**  
 13 **down tube size, yeah.**  
 14 Q. But with respect to MR55, you wouldn't be able  
 15 to operate MR55 under that scenario, true?  
 16 **A. Let me look here. Yeah, I mean it looks like**  
 17 **the math says roughly 33 gallons per minute is**  
 18 **available recharge capacity at the site, so 33**  
 19 **gallons per minute is not going to be compatible**  
 20 **with a minimum -- minimum recharge rate of 225.**  
 21 Q. Would it be possible with respect to MR55, based  
 22 on your knowledge of hydrology and hydrogeology,  
 23 would it be possible to change the  
 24 infrastructure of MR55 so injection could occur  
 25 at a lower minimum GPM?

Page 840

1 **A. No, I don't think -- number one, at these rates,**  
 2 **I wouldn't recommend it, the cost benefit,**  
 3 **frankly, at 30 gallons per minute. When we talk**  
 4 **about the role and how ASR wells operate, not**  
 5 **just the City but anyone's ASR wells, general**  
 6 **practice is to after a certain point of**  
 7 **recharging you have to redevelop the well. You**  
 8 **have water moving in two directions, so that**  
 9 **keeps the well clean.**  
 10 So if we're talking about putting in  
 11 30 gallons per minute in this instance, it would  
 12 not behoove the City, it would not pay  
 13 dividends, it would not be in the interest of  
 14 the City, or frankly anyone else at this point,  
 15 to try and squeak 30 gallons per minute into  
 16 this particular well to simply redevelop it at a  
 17 later time, it -- generally, the redevelopment  
 18 rates are high so we can get the velocities up  
 19 at 1200 gallons per minute just to redevelop any  
 20 fines or anything that may have taken part  
 21 inside the well. So I wouldn't advise it, if  
 22 you're asking me as a professional in this  
 23 capacity, would I advise the City to do that? I  
 24 would not.  
 25 Q. So from a cost benefit perspective, it doesn't

Page 841

1 make sense, but at least as far as whether it's  
 2 possible to change the infrastructure to  
 3 recharge at a lower GPM, it is at least  
 4 possible. Is that a true statement?  
 5 **A. I could make you an ASR well that we could**  
 6 **literally go over and recharge at an eyedropper**  
 7 **rate, doesn't mean that it's a good idea.**  
 8 Q. Okay. Do you have any knowledge of why the  
 9 infrastructure or the wells were -- were built  
 10 with differing minimum recharge rates?  
 11 **A. Yeah, sure, every -- every well is different.**  
 12 **Every well is -- in general, the better pumpers**  
 13 **are going to be better recharged, that's just a**  
 14 **function of aquifer transmissivity. So it's --**  
 15 **whether the aquifer can accept, excuse me, water**  
 16 **is generally based on two things. Number one is**  
 17 **permeability of the formation, and number two is**  
 18 **the shear available storage at that site.**  
 19 When you recharge, there is a mounding  
 20 effect of water at that particular well. So in  
 21 the instance where we have, let's say, 20 foot  
 22 depth to water, that would not present as much  
 23 opportunity to recharge as, let's say, 15 foot  
 24 to water in that same environment, in that same  
 25 hydrogeologic environment.

Page 842

1 Q. With respect to this chart, which has to do with  
 2 2016 Wichita groundwater level measurements,  
 3 under this chart, would any water have been  
 4 injected into these wells in 2016?  
 5 **A. You know, I'm looking here. Over in the far**  
 6 **right-hand column would be -- should be the**  
 7 **answer to your question. Roughly, if you look**  
 8 **at the bounds of the actual infrastructure for**  
 9 **the entirety of the Phase II wells, we would be**  
 10 **talking about roughly 819 gallons per minute**  
 11 **that the City could feasibly put into the**  
 12 **ground, or 1.18 million gallons per day.**  
 13 Q. Could they actually do that, to your knowledge?  
 14 **A. Sure.**  
 15 Q. Under the proposal that the City has submitted,  
 16 would they be able to do that?  
 17 **A. No, I believe we proposed a minimum of 5 MGD,**  
 18 **that is for operational considerations. Again,**  
 19 **we're talking about trying to squeak -- while**  
 20 **196 gallons per minute sounds like a lot, in**  
 21 **context of trying to build physical recharge**  
 22 **credits for, again, later water supply, it's**  
 23 **very difficult to do in the context of even**  
 24 **having, in this case, this many wells available.**  
 25 The plant, at least ASR Phase II, that

1 plant operates at either 30 million gallons a  
2 day or 15 million gallons a day. So talking  
3 about sending 1.18 million gallons per day to  
4 specific wells, in this case at 196 or  
5 162 gallons per minute, if we were just to try  
6 and flow route that minimum, in this case 1.18  
7 or even the minimum that was proposed at roughly  
8 5 million gallons a day, around the well fields,  
9 there's piping within the well field and so  
10 producing 15 million gallons a day, even if 10  
11 million of that was sent to the City, let's say  
12 in this instance, and 5 million of that we  
13 wanted to recharge, it takes a very long time  
14 for that to go around the ASR piping. There's  
15 just physical minimums as a function of the  
16 infrastructure that -- where logically it's  
17 extremely difficult to put it in the ground and  
18 doesn't behoove the City, or frankly anyone, to  
19 try and simply slow drip the -- slow drip the  
20 water into the -- into the ground so ...  
21 Q. So under the City's proposal, if we're less than  
22 that 5 MGD, under that scenario, it's at least  
23 possible that there could be recharge capacity  
24 in the aquifer, but the City would then not  
25 recharge if it's less than that; is that true?

1 is -- this is the sustainable physical recharge  
2 capacity based on our knowledge of how each well  
3 operates, how it responds when you inject, in  
4 this case, at 2016 levels. We had looked at  
5 multiple years to come up with the sustainable  
6 specific injectivity rates. So this is not the  
7 accounting of water in 2016, this is simply  
8 representing what we think the sustainable rate  
9 for 2016 would be based on our water level  
10 measurements and how individual wells behave.  
11 You can recharge, let's say, theoretically,  
12 we could recharge 1,000 gallons per minute down  
13 this well, as example MR02, for a very, very  
14 short period of time. But the goal of the ASR  
15 project and in operation of the water treatment  
16 plant is to operate over as much time period as  
17 we can to the benefit of not only the City but  
18 others. So when the plant's running, we need to  
19 have compatible recharge capacity to essentially  
20 put it in the ground, if we're going to put it  
21 in the ground, and that's what this table is  
22 representing, that sustainable value, not  
23 necessarily the peak value or the value that was  
24 represented in the 2016 ASR accounting report.  
25 Q. So from this table alone, you can't tell the

1 **A. Operationally, I think that's -- that's what we**  
2 **discussed, we looked at what we think we could**  
3 **physically do under high conditions even. And**  
4 **that pairs up very nicely with the**  
5 **second-to-the-left column, the minimum well**  
6 **infrastructure recharge rate, that's essentially**  
7 **pretty close to that minimum infrastructure**  
8 **rate. So that's essentially the genesis of the**  
9 **5 MGD, if you will.**  
10 Q. So going back to figure 14, which is still in  
11 front of you, would it at least be a true  
12 statement that at least with respect to recharge  
13 wells in 2016 the vast majority of them did not  
14 inject any water into the aquifer? Is that a  
15 true statement?  
16 **A. I won't speak to what actually occurred in 2016,**  
17 **I will just tell you that these are the**  
18 **sustainable values that we would predict based**  
19 **on how each well individually behaves. That is**  
20 **what figure 14 is representing.**  
21 Q. Well, just a moment ago you told me that if we  
22 looked at the far right column of this table it  
23 tells us the amount of water that actually went  
24 into the aquifer in 2016; is that true?  
25 **A. No, this is not the accounting report. This**

1 amount of these wells that actually injected  
2 water into the aquifer in 2016?  
3 **A. No, that would be as part of the 2016 accounting**  
4 **report.**  
5 Q. What exactly is a recharge basin?  
6 **A. A recharge basin is effectively a excavation**  
7 **into the ground where we have permeable**  
8 **formations ideally underneath it that**  
9 **facilitates dumping of water into that basin.**  
10 **That water then percolates downward into the**  
11 **aquifer, which acts like, if you will, a large**  
12 **diameter well, if you want to think of it that**  
13 **way. It is an opportunity to recharge in a**  
14 **different manner other than wells; it just**  
15 **facilitates it using a ground surface method in**  
16 **infiltration rather than using a specific well**  
17 **in the ground.**  
18 Q. So in the past, has the City used recharge  
19 basins to help to recharge the aquifer?  
20 **A. Yes.**  
21 Q. And based on your knowledge of having worked for  
22 the Equus Beds Groundwater Management District  
23 and also Burns & McDonnell, is it your knowledge  
24 that the majority of the recharge that has  
25 occurred based on the City's efforts, has the

Page 847

1 majority of it occurred because of recharge  
 2 basins?  
 3 **A. Yes, and that is a function of high water**  
 4 **levels, again. The -- even since 2013 in**  
 5 **commissioning the plant and forward, we have**  
 6 **seen unprecedented water level recoveries to**  
 7 **near predevelopment conditions, which means that**  
 8 **there's just very little space in the aquifer.**  
 9 **Recharge basins offer generally more**  
 10 **capacity than individual wells. The two**  
 11 **locations that are effective right now for**  
 12 **recharge basin capacity are RB2 and recharge**  
 13 **basin 36, with the majority of the water**  
 14 **produced currently - and this is jogging my**  
 15 **memory from the accounting reports - but, in**  
 16 **general, in discussions with the City and my**  
 17 **knowledge of those ASR accounting reports, the**  
 18 **majority of the recharge has been going to our**  
 19 **recharge basin 36, which is one of those basins.**  
 20 Q. Could the City, from a conceptual standpoint,  
 21 could they add more recharge basins in the  
 22 future?  
 23 **A. You could.**  
 24 Q. Is there a reason that the City is precluded  
 25 from adding recharge basins?

Page 848

1 **A. I don't know of anything prohibiting it.**  
 2 Q. So I guess my question is if recharge basins  
 3 have accounted for the majority of the actual  
 4 recharge in the aquifer, as you're sitting here  
 5 today, do you have any knowledge why the City  
 6 hasn't built more recharge basins?  
 7 **A. Well, recharge basins have very similar behavior**  
 8 **to recharge wells, and their capacity is also**  
 9 **based on water levels. You do get a mounding**  
 10 **effect when you recharge, so not only downward**  
 11 **percolation but there is an outward push, pardon**  
 12 **me. So recharge capacity is also based on water**  
 13 **level, so that is -- that is the same between**  
 14 **recharge basins and wells. So when the**  
 15 **aquifer's in this case or this instance, in this**  
 16 **discussion, full at a location, a recharge basin**  
 17 **is perhaps no more effective than a well.**  
 18 **They can be somewhat land intensive, and**  
 19 **they are also more so site specific than wells.**  
 20 **Siting of recharge basins can be very picky.**  
 21 **You have to have not only the surface**  
 22 **compatibility, you have to have the soils at the**  
 23 **surface that are compatible with it but also**  
 24 **directly underneath it. You have to have the**  
 25 **ability of that water to move not only down but**

Page 849

1 **laterally; and in instances where we have, let's**  
 2 **say, clay at maybe 15 or 20 feet, that can**  
 3 **actually impede recharge capacity.**  
 4 **So they are not just a simply go out, dig a**  
 5 **hole, and put water in it and it is that simple,**  
 6 **from that standpoint. I hope that kind of**  
 7 **classifies how recharge basins work and their**  
 8 **infeasibility.**  
 9 Q. It does. And you mentioned a number of  
 10 variables that must be in place for a recharge  
 11 basin to work effectively, and I'm not going to  
 12 try and pretend to summarize all those variables  
 13 again, but if we were to assume just arguendo  
 14 that conditions are favorable and one could  
 15 construct a recharge basin, if the City were to  
 16 build additional recharge basins in the future,  
 17 that could potentially increase their recharge  
 18 capacity. Is that a true statement?  
 19 **A. Sure.**  
 20 Q. And same question with respect to additional  
 21 recharge wells, if the conditions, all the  
 22 hydrological conditions were favorable and the  
 23 City built more recharge wells in the future,  
 24 could that also increase their recharge capacity  
 25 of the aquifer?

Page 850

1 **A. Sure. I wouldn't recommend it at this interval.**  
 2 **Again, we've got 34.52 million gallons a day**  
 3 **or -- yeah, 34.5 million gallons a day of**  
 4 **recharge capacity right now. We've got wells**  
 5 **that are sitting idle in terms of recharge**  
 6 **capacity just because we can't physically**  
 7 **recharge. You could do it, I wouldn't recommend**  
 8 **it, but you could do it.**  
 9 Q. I guess the question I then have for you, and  
 10 maybe you just answered this 'cause it's based  
 11 on your recommendation maybe that you wouldn't  
 12 do it, but was it modeled in the modeling that  
 13 you and your group as consultants did and the  
 14 modeling done by the City, was it included in  
 15 your model the prospect that there could be more  
 16 recharge basins or recharge wells added in the  
 17 future, was that taken into account?  
 18 **A. Well, so the way -- we're going to be referring**  
 19 **to the Equus Beds groundwater model in this**  
 20 **instance and then the drought model runs, I'm**  
 21 **assuming that's what you're referring to. It**  
 22 **was not accounted for insofar that we basically**  
 23 **assumed that the credits existed, we didn't look**  
 24 **at how they were created.**  
 25 **We ran the model with a starting head**

1 condition that said, okay, the credits are  
2 already essentially in existence and then  
3 recovered them in the manner that's described in  
4 the report, we distributed pumping to city  
5 wells, so there wasn't a distribution based on  
6 recharge basins or wells or anything of that  
7 nature.

8 We -- we basically assumed a uniform  
9 distribution relative to pumping capacity of the  
10 wells. In other words, the stronger pumping  
11 wells probably had greater recharge to build  
12 those credits. That would be the only  
13 correlation in terms of how recharge credit  
14 accrual would have been distributed in the  
15 model. We didn't actually do that. We just  
16 assumed a starting condition, and how are we  
17 going to recover credits was the focus of the  
18 model, if that makes sense.

19 Q. Yes, it does. And so I think just to answer the  
20 question in a simple context, I mean, you can't  
21 conceivably account for every variable when you  
22 model, I understand it's a model, it's a best  
23 guess of what will occur, so -- but if one were  
24 to include -- or if the City were to build a  
25 bunch of additional recharge basins in the

1 couldn't recover them.

2 So based on that, I don't -- I don't see a  
3 significant delta in the answer relative to the  
4 demands or how water level changes would happen  
5 within the model over time because I just don't  
6 see that much redistribution of actual credits  
7 and where they occur.

8 Q. Under what circumstances would a recharge basin  
9 be more effective for recharging the aquifer  
10 over a recharge well?

11 A. If you can think of it this way, it's just a  
12 large diameter well. I mean, it just, it offers  
13 more capacity at a specific site if you have  
14 compatible soils. That's the easiest way to  
15 explain it, I think, without getting into  
16 extreme detail.

17 Q. So in a simplistic sense, is that the reason  
18 that the recharge basins have accounted for more  
19 recharge to the aquifer than the wells?

20 A. No, in -- in this case, in this instance, if  
21 we're talking about what's been recharged to  
22 date, simply put, there's not enough room with  
23 the existing wells. The wells as shown in  
24 figure 14, in this example in 2016, a lot of  
25 them simply couldn't operate. We had water

1 future, would that change some of the modeling  
2 in the future?

3 A. I don't think it would change this particular  
4 instance of the model significantly because we  
5 would assume, I mean, roughly the same  
6 distribution of recharge credit recovery, which  
7 is what steers the water level changes in the  
8 model. So I don't think there would be a  
9 significant difference there.

10 Q. There wouldn't be, in your mind, a significant  
11 difference, but there would at least be some  
12 difference; is that true?

13 A. If we knew that basins or other recharge  
14 infrastructure would be concentrated in, let's  
15 say, the core of the well field or the north end  
16 of the well field for a particular purpose,  
17 sure, we might have accounted for that. I don't  
18 think that's going to be the instance.

19 I think in any case the City would  
20 logically produce credits from where they would  
21 be accrued, and in order to recover them, you're  
22 going to produce them strategically in, very  
23 likely, the core of the well field where your  
24 strongest pumping wells are. There would be no  
25 purpose in establishing credits where you

1 levels that were too high to actually physically  
2 inject water. So we still want to operate.  
3 Right now the City does not get any credit for  
4 anything that's not put in the ground. So the  
5 logical place to put that is where we have  
6 capacity. One of the only locations left with  
7 any significant capacity is recharge basin 36  
8 and to some extent recharge basin 2. But even  
9 in recent history, we've seen water levels at  
10 recharge basin 2 be extremely high and not  
11 facilitate recharge.

12 Q. Let's move on to some of the specifics of the  
13 modeling that you performed. First of all, with  
14 respect to the drought simulation and your  
15 involvement in that drought simulation, I note  
16 that in your expert report you mention some of  
17 the work done on the drought simulation, but I  
18 assume that you would defer more to  
19 Mr. Winchester as far as why a certain drought  
20 was simulated. Is that a true statement?

21 A. That's correct, the -- the policy of drought and  
22 the PDSI work and the genesis of what is a  
23 1 percent and why, that would have been done by  
24 Mr. Winchester, and the demands that are  
25 associated with that would have come from the

Page 855

1 **City, yes.**  
 2 Q. So if I were to ask you why didn't the City  
 3 model different types of drought scenarios, in  
 4 other words, 1 percent or 2 percent -- versus a  
 5 2 percent drought scenario, would you be the  
 6 best to answer those questions, or would those  
 7 questions be best answered by Mr. Winchester?  
 8 **A. Either Mr. Winchester or really that's a policy**  
 9 **question, so city council has decided to plan**  
 10 **for that specific 1 percent. The reason we ran**  
 11 **with the numbers we did is because those numbers**  
 12 **were supplied from the City as policy, we are**  
 13 **going to plan for a 1 percent drought. Burns &**  
 14 **McDonnell, we need to understand what the role**  
 15 **of this is to our ASR project, how does this**  
 16 **relate to 1993 levels, and do we have an**  
 17 **opportunity with AMCs to maintain the aquifer in**  
 18 **a fuller condition, understanding that its role**  
 19 **is going to be 1 percent drought protection. So**  
 20 **I hope that clarifies your question in terms of**  
 21 **where the 1 percent came from.**  
 22 Q. That does -- that does help. Did the City  
 23 account for -- well, first of all, what is a  
 24 MYFA?  
 25 **A. Multi-year flex account.**

Page 856

1 Q. Did the City account for MYFAs, or multi-year  
 2 flex accounts, in the modeling that was  
 3 performed?  
 4 **A. Yes. The City did not, I did insofar as the**  
 5 **demands from agricultural irrigation that are**  
 6 **within the model, which represent actual**  
 7 **demands, reported values to DWR in the year 2011**  
 8 **and 2012 that are repeated throughout the model.**  
 9 **Those values are based on actual metered**  
 10 **reported values.**  
 11 **So so far as during the drought of 2011 and**  
 12 **2012, we had essentially overpumping in some**  
 13 **instances, not all instances of water rights,**  
 14 **where drought term permits were available as one**  
 15 **method, which eventually rolled into multi-year**  
 16 **flex accounts. So, basically, if we assume that**  
 17 **the water applied by ag was to grow crops out of**  
 18 **necessity, not waste of water but actual there**  
 19 **was a demand, we needed to keep, as an example,**  
 20 **the center pivot on just to meet the**  
 21 **evapotranspiration demands of that day or that**  
 22 **week and overpumped in that instance, multi-year**  
 23 **flex accounts would be very similar to, in my**  
 24 **opinion, what happened during 2011 and 2012. So**  
 25 **we would see increased demands during a period**

Page 857

1 **of drought. And 2011 and 2012, we certainly saw**  
 2 **that in the amount of typical agricultural**  
 3 **pumping.**  
 4 **So from the standpoint of our multi-year**  
 5 **flex accounts and their response and the ability**  
 6 **to overpump, let's say, an individual ag water**  
 7 **right during drought, is that represented in the**  
 8 **model? Yes, we think so relative to the years**  
 9 **2011 and 2012 that are in the model.**  
 10 Q. Well, let me ask you, how many year window is  
 11 involved in a multi-year flex account?  
 12 **A. There is a total of five in the current version**  
 13 **of the multi-year flex account, to my**  
 14 **understanding.**  
 15 Q. So in the iteration of 2011 and 2012, that would  
 16 have been just an iteration of two out of those  
 17 five years of the multi-year flex account. Is  
 18 that a true statement?  
 19 **A. Sure.**  
 20 Q. And so in other words, when we multiply those  
 21 two years over the course of eight years, are  
 22 we -- are we properly accounting for the other  
 23 three years of what would occur during a  
 24 multi-year flex account?  
 25 **A. I believe this goes back to some of my answers**

Page 858

1 **previously where I can't predict what an**  
 2 **individual user may or may not do, that gets**  
 3 **very, very complicated. However, in general, I**  
 4 **think if you look at past irrigation trends,**  
 5 **which I did, as part of the justification to**  
 6 **make sure we had a gut check on things like**  
 7 **multi-year flex accounts or drought terms, there**  
 8 **was initially some concern by GMD2 and DWR that**  
 9 **said, well, there was a lot of pumping in 2011**  
 10 **and 2012. Of course there was, there was**  
 11 **extreme drought.**  
 12 **But we also looked at your authorized**  
 13 **quantity for both the basin storage area and**  
 14 **central well field area to say, okay, well, what**  
 15 **does this look like in terms of what's actually**  
 16 **authorized? And in both 2011 and 2012, while**  
 17 **some people overpumped, others had very, very**  
 18 **large water rights established, very, very old**  
 19 **water rights relative to the appropriations that**  
 20 **were done, so things that were established**  
 21 **during, let's say, flood, with higher**  
 22 **quantities, so some of those irrigators didn't**  
 23 **overpump necessarily.**  
 24 **But in total, in net, if you look at 2011**  
 25 **and 2012, the total amount pumped, even with the**

1 high demands that were -- occurred during 2011  
2 and 2012, the net value that was pumped was  
3 still under the authorized quantity within, I  
4 believe, the central well field storage area.

5 So, yes, very, very much higher but not --  
6 not over the net authorized quantity; in other  
7 words, not everybody overpumped. And with an  
8 extreme drought like 2011 and 2012, which were  
9 very, very, very much extreme drought, that gave  
10 me the confidence to say essentially that was a  
11 legitimate agricultural response within the  
12 model, and I'm comfortable saying that, you  
13 know, those are reasonable responses by  
14 agriculture to represent within the model in  
15 terms of a future projection on how ag might  
16 respond to that particular drought event.

17 Q. Well, let me ask you this: During a five-year  
18 multi-year flex account, let's say that a user  
19 overpumped their water right during the first  
20 two years, just assume that with me for a  
21 moment, at least in one of those remaining three  
22 years, they would have to pump less than their  
23 authorized quantity. Is that a true statement?

24 A. Sure.

25 Q. And my question is how was the fact that if

1 representing an actual agricultural response.

2 Q. You mentioned drought term permits, let's talk  
3 about those just for a moment. Drought term  
4 permits were in place in 2011 and 2012, is that  
5 a true statement?

6 A. I believe it was -- the concept was enacted,  
7 yeah, in the later part of 2011, maybe October  
8 or something like that, where the State came up  
9 with a solution to say, look, there was a lot of  
10 people that overpumped, a lot of people that  
11 gained very quick knowledge about what their  
12 water right was and wasn't, and so how to deal  
13 with that, how to make sure that we could try  
14 and at least make that somewhat net neutral. So  
15 that would have been the genesis of the drought  
16 term permits.

17 Q. Are drought term permits still in effect today?

18 A. Not that I recall. I mean, the closest  
19 compatible thing to that would be the multi-year  
20 flex account.

21 Q. So ask you to flip to table 26, which is on  
22 page 2-12 of the City's proposal.

23 A. Okay.

24 Q. And this table reflects net irrigation values,  
25 is that a true statement?

1 someone's enrolled in a multi-year flex account  
2 and they overpumped during 2011 and 2012 and  
3 then in those future years of the drought they'd  
4 have to pump less, how was that accounted for in  
5 the City's modeling?

6 A. Sure, the drought term permits, some of them had  
7 to essentially pay it back, you could borrow  
8 from the next year. Some people simply took a  
9 notice of noncompliance. But, again, it was  
10 under the net value for authorized quantity. In  
11 other words, yes, pumping was high, but it was  
12 not exceedingly high so far that it exceeded the  
13 net value within the central well field storage  
14 area in terms of what was authorized. I believe  
15 that number is roughly 14,000 acre-feet.

16 This is going back to numbers I crunched a  
17 long time back, but what gives me the confidence  
18 to say that the model is okay in terms of  
19 predicting what ag's response will be is that we  
20 are still slightly under that net value. So we  
21 didn't go to, let's say, 20,000 acre-feet of ag  
22 pumping in 2011 and 2012 and what we would  
23 anticipate in terms of the authorized cap being  
24 roughly 14,000, if that make sense. So I'm  
25 comfortable with the numbers that were in there

1 A. Correct.

2 Q. If drought term permits are no longer in effect  
3 today, would some of these net irrigation values  
4 look differently today based on that fact?

5 A. I don't think so. If we were -- if we were to  
6 look at the same -- same values for -- let's say  
7 2011 happened tomorrow, say the drought of 2011  
8 happened tomorrow, I don't know with the  
9 multi-year flex account program being enacted  
10 and the severity of that drought that those  
11 numbers would be any different. I mean, we --  
12 we would like to assume that that water was  
13 applied in a manner that resulted in actual  
14 yield of crops, not simply pumping to pump or  
15 finish for another reason. I mean, that was an  
16 actual demand, so that is a reported value to  
17 the Division of Water Resources. I don't know  
18 that it would be that different.

19 Another approach, you could look at just  
20 simply what is the net irrigation requirement  
21 given the evapotranspiration demands of that  
22 specific year, but that's a hypothetical. Here  
23 we have actual observed pumping to the drought  
24 of what I consider an extreme drought of record  
25 for this area where ag responded accordingly,

Page 863

1 and that's represented within the model, and I  
 2 think it is a legitimate value to use.  
 3 With respect to planning for the future, I  
 4 mean, in a very short time period, and, again,  
 5 I've been doing water rights consulting since  
 6 obviously with GMD, we've seen water use  
 7 programs expand in their flexibility. So first  
 8 drought term permits, which was unprecedented,  
 9 the ability to borrow water from another year,  
 10 universally essentially across the state, if  
 11 needed, and that followed with multi-year flex  
 12 accounts, which allows for moving of water  
 13 between wet years and dry years, and so I  
 14 anticipate from a planning standpoint, if  
 15 anything, we may see ag demand and potentially  
 16 demand on the aquifer go up as those programs  
 17 are -- continue to be implemented. It's simply  
 18 flexibility for moving years of wet to dry.  
 19 Q. So with respect to a drought term permit, is it  
 20 true that there's usually one year of high use  
 21 and one year of less use of water under a  
 22 drought term permit?  
 23 A. I -- I don't have that data in front of me. Not  
 24 necessarily. The user could have overpumped by  
 25 10 acre-feet and just didn't want to take the

Page 864

1 notice of noncompliance relative to his water  
 2 right of 200 acre-feet. I don't have that data  
 3 in front of me, so I wouldn't want to speculate  
 4 without going through it.  
 5 Q. So if I were to characterize how a drought term  
 6 permit works in that fashion, as you're sitting  
 7 here today, you wouldn't have the knowledge or  
 8 expertise to either agree or disagree with me in  
 9 that regard, is that what you're saying?  
 10 A. Could you -- could you ask the question one more  
 11 time?  
 12 Q. The question is with respect to a drought term  
 13 permit, I mean, in just a very basic sense,  
 14 isn't it if one uses a bunch of water in year  
 15 one, in year two, they would have to use less  
 16 water under a -- if they exceed in year one,  
 17 they'd have to use less in year two. Is that a  
 18 true statement?  
 19 A. That -- that was generally the concept with  
 20 the -- the additional advent of the multi-year  
 21 flex account where you had the opportunity to  
 22 also roll into a multi-year flex account. There  
 23 was a lot of discussion during that time also  
 24 about forgiveness, just blatant, let's --  
 25 let's -- that was a really tough year in

Page 865

1 history, how are we going to deal with it, how  
 2 are we going to deal with the economics of that?  
 3 So I hope that answers your question that at  
 4 least I do understand what drought term permits  
 5 were, their role, and then their relative impact  
 6 to the model.  
 7 Q. And with the implementation of multi-year flex  
 8 accounts versus the drought term permits, would  
 9 you agree that because with a multi-year flex  
 10 account it's read over five years, the use of  
 11 water would be different under a multi-year flex  
 12 account as opposed to a drought term permit?  
 13 Would that be a true statement?  
 14 A. Potentially, yeah, I mean, you're -- without  
 15 defining what that climate is over that  
 16 particular five years, to make it a  
 17 simplistical, you know, equation, all things  
 18 equal, you know, two years to five years, yeah,  
 19 it's -- it's a multiplier where you would have  
 20 to reduce just as you described.  
 21 Q. So if the drought term permits went into effect  
 22 in 2011 and if you just follow with me for a  
 23 moment and we assume that we had one year high  
 24 use and one year lower use and that's -- that  
 25 iteration is projected over the course of eight

Page 866

1 years, one year high, one year low, and those  
 2 drought term permits are no longer in place,  
 3 wouldn't that potentially change some of the  
 4 numbers in the modeling?  
 5 A. No, because you characterized as one year high  
 6 and one year low. If you look at the 2011 and  
 7 2012 values for the central well field storage  
 8 area, which is where the majority of the impact  
 9 will be, there is both years essentially of high  
 10 relative to what is normal. If you look at  
 11 years nine and ten, which are relatively normal  
 12 years, we're in the 7,000s. If you look at  
 13 years one, two, three, all the way through  
 14 eight, we are in the 10,000s. So it would be  
 15 two years of high, not one year of high and one  
 16 year of low; it would just be high, as 2011 and  
 17 2012 were both very, very tough drought years.  
 18 And I would anticipate that to continue through  
 19 a multi-year flex account program.  
 20 And the other thing that we contemplated  
 21 during the model is, again, during a very short  
 22 period of time, we saw Kansas statutes change  
 23 which allowed multi-year flex accounts and other  
 24 programs, which increased flexibility in moving  
 25 water from wet years and dry years back and

1 forth. To think that that will go down or  
2 decrease, we wanted to be conservative in our  
3 numbers. Again, we're trying to establish a  
4 reasonable bottom for the project based on 2060  
5 demands, and so there's an element of, well, we  
6 see these programs now, these programs are  
7 becoming more popular, not that that's a bad  
8 thing, I think it's a good thing for water use  
9 in the State of Kansas. However, we want to be  
10 prepared for that. So, again, that's in our  
11 contingency numbers in trying to understand how  
12 ag will be projected through the future. I  
13 think that the 2011 and 2012 values that are  
14 presented in the model are reasonable.  
15 Q. And I listened to your words carefully, you said  
16 in 2011 and 2012, we would assume that the use  
17 would be high during 2011 and 2012. So at least  
18 with respect to a multi-year flex account, as we  
19 go to years three through five of the drought,  
20 if it was high use in the first two years, there  
21 would be less use in years three through five.  
22 Is that at least a true statement, then, under  
23 your scenario?  
24 A. If they were rolled into a multi-year flex  
25 account, but that would also assume that the

1 the area that we're discussing is, of course,  
2 the City.  
3 Again, if you look at the values of net  
4 irrigation use in the central well field storage  
5 area, I don't have it off the top of my head,  
6 but I believe it's roughly 14,000 acre-feet  
7 authorized. We're below that number. I think  
8 that the values of 2011 and 2012 essentially  
9 represent what ag would do, it's what they  
10 actually reported.  
11 I don't -- I don't anticipate value in  
12 looking at -- if we look at even that delta of a  
13 few thousand acre-feet repeated over, let's say,  
14 eight years, so if we took the delta, what if  
15 everybody pumped their authorized quantity and  
16 that was the max 'cause that would essentially  
17 match the multi-year flex account program, that  
18 would be a peak value, I know there's some  
19 conservation built in there, but you'd only be  
20 talking about, let's say, four times eight as an  
21 example. So you'd be talking maybe 20 to  
22 30,000 acre-feet.  
23 That -- that amount of water over that  
24 period of time, I don't believe would result in  
25 significant water level changes. It could

1 entirety of the example, in this case water  
2 rights within the basin storage area or central  
3 well field area, would be actually enrolled in  
4 those programs. There are some very strong  
5 irrigation ag water rights within the basin  
6 storage area and central well field area such  
7 that a multi-year flex account may not be  
8 required. In other words, that water right is  
9 strong enough to support pumping during drought  
10 regardless. So it's just a high number followed  
11 by a high number consistently.  
12 Q. When you did your modeling, did you account for  
13 different irrigation pumping scenarios?  
14 A. No, we just repeated the 2011 and 2012 values,  
15 again thinking that those would be  
16 representative of what ag actually pumped since  
17 ag actually did that in 2011 and 2012, responded  
18 in that manner.  
19 Q. As far as future modeling goes, would that be a  
20 beneficial thing to think about and to alter the  
21 different irrigation pumping scenarios in the  
22 modeling?  
23 A. I don't believe it would provide significant  
24 water level changes in this instance because the  
25 large user driving the water level changes in

1 happen, but I think this is more representative  
2 of what would actually happen under the scenario  
3 that we've predicted and under the scenario that  
4 we modeled simply because those were actual DWR  
5 reported values.  
6 Q. And let me just ask this: Why didn't the City  
7 and the consultants for the City consider  
8 modeling different types of irrigation pumping  
9 scenarios?  
10 A. So you -- you predict things that you can  
11 control. I cannot control what an individual ag  
12 user does or doesn't do, whether they enroll in  
13 a multi-year flex account or they don't. We can  
14 look at things like net irrigation requirement  
15 and guess what an individual ag user may do.  
16 What we don't know are things like irrigation  
17 efficiency. Basically, you get down into the  
18 weeds so far that your precision of how your  
19 answer changes -- the precision of your answer  
20 doesn't change much. So in other words, you  
21 could go to a lot of effort without -- with  
22 diminishing return on the value of your answer.  
23 It's not that there wouldn't be value in  
24 doing that, you could go through that exercise,  
25 you could try and understand those -- those

Page 871

1 impacts, but, again, we have DWR reported values  
 2 that I think are adequately representative. And  
 3 then when we just talked about what the  
 4 potential delta would be in a worst-case  
 5 scenario, we're on the order of maybe 20 to  
 6 30,000 acre-feet over the entire drought period  
 7 just in that net increase. So if we applied  
 8 that additional 20,000 acre-feet over the  
 9 central well field water, we're not talking  
 10 about, in my opinion, substantial water level  
 11 changes to justify going at a water-right-by-  
 12 water-right basis and doing an examination. So  
 13 that would be my opinion.  
 14 Q. Would you agree that in the modeling performed  
 15 by the City and the City's consultants that the  
 16 water use demands for the City changed during  
 17 that eight-year period? Would you agree with  
 18 that statement?  
 19 A. Sure.  
 20 Q. And so I guess my question is if the water use  
 21 demand for the City changed during that  
 22 eight-year period, why were they held constant  
 23 for industrial users or irrigation users during  
 24 that eight-year period?  
 25 A. Well, they weren't held constant. Clearly table

Page 872

1 2-6 that we just talked about shows that they're  
 2 varying, and that is an observed value. From a  
 3 logical standpoint as a modeler, the best that I  
 4 can assume is that someone who pumped under a  
 5 certain set of conditions, under the same  
 6 hydrologic conditions, what would that  
 7 individual user do? Unless someone can give me  
 8 a very, very good reason why that user would do  
 9 something different, I would then consider it.  
 10 I think for, again, the purposes of this model  
 11 for ag, I've just previously described the  
 12 amount of delta that could occur even in a  
 13 worst-case scenario.  
 14 For an industrial user, whether that's heat  
 15 dissipation or whatever that scenario might be,  
 16 we might actually see some increases in the  
 17 industrial portion of that demand, just 'cause  
 18 that's the nature of industry, industry grows.  
 19 That's a good thing economically. So when we  
 20 look at maybe industry, we would actually see  
 21 demand potentially go up, which would cause, of  
 22 course, water levels to go down further.  
 23 I'm just trying to think of a scenario  
 24 where it would be outside of the bounds of what  
 25 was put together in the report in terms of

Page 873

1 reasonableness and -- and the number of  
 2 acre-feet taken out in a given year, and I think  
 3 we've got a pretty good justification.  
 4 Q. On page 2 of your expert report, you mention  
 5 that the model accounts for return flows. Is  
 6 that a true statement?  
 7 A. It does.  
 8 Q. And did you account for a potential change in  
 9 return flows during drought conditions?  
 10 A. No, it is based on -- so when we're talking  
 11 irrigation return flows, for the record, the way  
 12 the USGS model approach -- in this instance  
 13 approached the problem of return flows, so when  
 14 you irrigate, not all that water goes to  
 15 producing crops or evapotranspiration; some of  
 16 that water makes it past the crop root zone and  
 17 percolates downward back into the aquifer; that  
 18 is where we come up with the term net. So in  
 19 other words, if I pump 100 acre-foot of water,  
 20 90 of that may be consumed, some of that goes  
 21 back down to the aquifer, and that's what we're  
 22 calling net.  
 23 So that net value is based on a calculation  
 24 that is prescribed within the original USGS  
 25 model documentation. That net value is based on

Page 874

1 DW reported -- DWR reported system types, so  
 2 things like irrigation of efficiencies, so if  
 3 someone with a flood system versus someone with  
 4 a center pivot system, there is an efficiency  
 5 difference there, there is a difference in  
 6 return value, or net irrigation, that is  
 7 represented within the model, we do that. We  
 8 allow for that net consumption value to be  
 9 adjusted based on the DWR reported.  
 10 When you fill out a DWR water use report,  
 11 you report the system type that you used for  
 12 that particular acreage and that particular  
 13 water right. We use that within the model to  
 14 say what is the estimated return for that  
 15 particular pumping that occurred. So that is  
 16 how net irrigation is taken care of in the  
 17 model, and that is -- again, we do that in  
 18 accordance with the original USGS model  
 19 documentation.  
 20 Now, your question was how do we look at  
 21 how that might change during drought. It's  
 22 speculation to see whether that would go up or  
 23 down. That depends on the individual system, it  
 24 depends on how that user operates, it depends  
 25 on, again, the type of system. Flood may not

1 change as much as a more efficient system, such  
2 as center pivot or drip tape.

3 I'm just trying to think of a reason it  
4 would change, and the efficiencies of those  
5 systems, probably not going to change a whole  
6 lot. Again, we're talking about a very, very  
7 minute number. If you look at the total  
8 pumping, that -- that value still came out, so  
9 we'd be talking in worst-case scenario, most  
10 everything in the basin storage area is still on  
11 fairly efficient systems, so we're talking about  
12 center pivots and things of that nature, so  
13 you're talking maybe 93 percent as a -- as a  
14 value. So we're talking about 7 percent of  
15 total pumping. Even that distributed over the  
16 eight years, I don't anticipate having a large  
17 value. So that's -- that's one of the reasons  
18 we didn't -- didn't look at it, it was just the  
19 net impact to the proposal.

20 Q. Okay. Let me just ask you this in a basic  
21 sense, let's say that we assume for a moment  
22 that the water is -- or the ground is saturated,  
23 that we've had some wet years. Would more water  
24 in the account of -- when we're talking about  
25 return flows, would more water return to the

1 can come up with a better answer. We could  
2 certainly try a different approach, but I don't  
3 know that we'd end up with any better precision  
4 or accuracy than what we've got in the report  
5 right now.

6 Q. And I understand that every situation is a  
7 little different, we're talking about different  
8 soil types, we're talking about different  
9 infrastructure, things of that nature, but I'm  
10 just asking in general that if it's a wet year  
11 and an irrigator puts -- there's 10,000, let's  
12 say, acre-feet of return flow from irrigators in  
13 a wet year versus 10,000 acre-feet of return  
14 flow during a dry year, in your estimation,  
15 during a wet year, would more of that  
16 10,000 acre-feet enter into the aquifer versus  
17 during a dry year when, say, the roots of a tree  
18 or the roots of a crop would absorb that return  
19 flow before it was actually able to go into the  
20 aquifer, that's my question?

21 A. All right. So you'd end up potentially both  
22 ways, so you would have a higher runoff  
23 probability under a wet year. So if you were  
24 applying water to a given situation, it depends  
25 on very much the soil types. If there's not a

1 aquifer if the ground is saturated during a wet  
2 year versus during a dry year when the ground is  
3 very dry?

4 A. The answer is it depends. If we're talking  
5 about net irrigation from a -- we're not talking  
6 about rainfall and precipitation, your question  
7 was oriented towards pumping?

8 Q. That's right.

9 A. Okay. Under that scenario, it depends. So  
10 you're talking about daily operation decisions  
11 of an individual user, which I cannot control,  
12 nor would I try and estimate. The -- the  
13 closest I would come to an approach would be  
14 looking at net irrigation value. So in your --  
15 in your example where someone says, okay, let's  
16 have -- we have a saturated value, it rained,  
17 the water is standing, let's say, out in the  
18 field, do we need to irrigate that day? That's  
19 an individual user's decision. The return flow  
20 would potentially be different. That water  
21 could run off as opposed to infiltrating.  
22 Conversely, when it's dry, there is more crop  
23 demand, depending on the condition of that crop,  
24 so that also depends.

25 So long way of saying I don't know that we

1 demand from the plants in that instance because  
2 it is wet and let's assume that we do have sandy  
3 soils in this instance just to make it easy  
4 conceptually for everyone to look at here, if it  
5 was wet and we just didn't have, let's say, the  
6 crop, cool day, wet, not as hot, non-drought, if  
7 we apply water and that water doesn't get  
8 absorbed in the root zone during those wet  
9 conditions, it would simply bypass and make it  
10 as return flow, so the number would be higher.

11 Conversely, on a worse soil where you have  
12 saturation, the plants already have as much  
13 water as they need and you could have runoff so  
14 it could actually be less. But in your  
15 instance, I think you're referring to sandy  
16 soils maybe, it depends on what your -- what  
17 your soils are really.

18 Q. So as far as answering the question, it's  
19 hard -- you're not able to come up with an  
20 answer based on whether there'd be more return  
21 flow in a dry year versus a wet year, you don't  
22 have any estimate or --

23 A. It's --

24 Q. -- guess as far as what would occur?

25 A. It's literally a daily soil water balance

Page 879

1 question, and the key value in there is soil,  
 2 and the next part of that is water balance. If  
 3 I don't have one, it's hard to determine the  
 4 other. It could go either direction on your  
 5 question.  
 6 Q. And I'm -- and I'm asking you based on your  
 7 knowledge of the soil types in the Equus Beds  
 8 Aquifer region, in that well field area, and  
 9 this is based on your knowledge and you project  
 10 that over the whole of the aquifer, do you  
 11 believe more water would return into the aquifer  
 12 from return flow during a dry year versus a wet  
 13 year, or do you have an answer to that?  
 14 A. As a -- as a bulk net value, I would say -- I  
 15 would guesstimate that we could potentially see  
 16 irrigation return flows go down. Assuming that  
 17 the crop differential, the demand for that water  
 18 that's in the root zone, if we're applying it  
 19 and being effective irrigators and good  
 20 conservationists, that's where we want the  
 21 water. In other words, we want the soil and the  
 22 crop to use it, not have it go back down and  
 23 just simply repump it. So from that standpoint,  
 24 we would see the effective return value or the  
 25 net irrigation value, we would see that number

Page 880

1 go down, so in other words less return to the  
 2 aquifer under that situation.  
 3 Q. It would go down during a time of drought, is  
 4 that what you're saying?  
 5 A. Sure, under dry conditions. If, again, we're  
 6 applying it in the manner that we're keeping the  
 7 moisture value in the root zone in that optimal  
 8 condition.  
 9 Q. Do you know if there's research or applications  
 10 from an engineering standpoint where one can  
 11 better predict what return flows would look like  
 12 during a wet year versus a drought year as far  
 13 as modeling goes?  
 14 A. In this instance, taking a basin water approach,  
 15 probably not. Not -- again, relative to the  
 16 value of the improvement of the model results,  
 17 you could probably do it. I just -- I probably  
 18 wouldn't at this -- at this level detail.  
 19 Q. Okay. And without beating a dead horse, at  
 20 least as it relates to the City's modeling, the  
 21 City didn't take into account a change in return  
 22 flows during wet years versus dry years; is that  
 23 true?  
 24 A. That's correct.  
 25 Q. I'd ask that you flip to page 2-3 of the City's

Page 881

1 proposal.  
 2 A. Okay.  
 3 Q. Now, on page 2-3 of the City's proposal --  
 4 perhaps I'm not on the right page. Yes, there  
 5 it is. If you go about two-thirds down on that  
 6 page, it refers to the E&S well field.  
 7 A. Okay.  
 8 Q. First of all, what is the E&S well field?  
 9 A. That is the local well field that is within the  
 10 core of the City of Wichita. That is  
 11 represented, I believe, on figure 1, you can  
 12 kind of see where that is at, it is in  
 13 essentially -- near the convergence of the Ark  
 14 River and Little Arkansas River.  
 15 Q. And on page 2-3 of the proposal, it says, E&S  
 16 well field is not considered a firm source  
 17 during drought due to water quality and limited  
 18 capacity during lowered Arkansas River flows.  
 19 Is that what that sentence states?  
 20 A. That is accurate.  
 21 Q. What is meant by that statement?  
 22 A. Well, I think it establishes both the reason  
 23 that it is not a firm source -- a firm source is  
 24 something you can count on in terms of the water  
 25 supply planning industry, something that will be

Page 882

1 there day in, day out under a varying set of  
 2 hydrologic conditions.  
 3 The E&S well field is a alluvial well  
 4 field, it is a shallow aquifer at that location  
 5 that very, very much relies on surface water  
 6 flows for support. And what we know is that  
 7 during lower flows, the water quality in the  
 8 Arkansas River gets poor. We also know that  
 9 during lower flows, the capacity of the well  
 10 field diminishes greatly. So that is the reason  
 11 it is not necessarily a firm source of supply  
 12 because of both the water quality challenges and  
 13 the shallow aquifer at that particular location.  
 14 If we don't have sustained river flows, we  
 15 don't have the water quality that makes it a  
 16 viable source or a good source of water for the  
 17 City, nor do we have the yield that we would  
 18 like to see from that particular well field  
 19 during drought. So in other words, as things  
 20 get drier, very, very much that well field gets  
 21 poor in yield and water quality both.  
 22 Q. With respect to the Bentley reserve well field,  
 23 what is the Bentley reserve well field in that  
 24 next sentence?  
 25 A. So that would refer to there are a string of

1 wells that I believe have a specific trigger  
 2 relative to the flow in the Arkansas River; I'm  
 3 not sure if it's an elevation or if it's a flow  
 4 level. But if flow does not exceed a certain  
 5 point or if the river elevation does not exceed  
 6 a certain point, those wells cannot come on by  
 7 their permit conditions.  
 8 Those wells are essentially capturing  
 9 induced surface water flow, so when they pump,  
 10 they pump essentially, after a certain time,  
 11 water that is sourced from the Arkansas River  
 12 rather than pumping groundwater. While they are  
 13 wells, they are very, very much sourcing water  
 14 from the main point of recharge, which is the  
 15 river. Essentially put, if the river does not  
 16 flow well enough, the water quality and total  
 17 amount of flow in the river does not support the  
 18 permit conditions that are tied to those  
 19 particular wells for pumping, ergo it is not a  
 20 firm source of supply because it cannot be  
 21 counted on during low flow conditions.  
 22 Q. Do you know what the authorized quantity is for  
 23 the E&S well field off the top of your head?  
 24 A. I don't off the top of my head.  
 25 Q. Do you know off the top of your head what the

1 **PRESIDING OFFICER:** Yes.  
 2 **MR. STUCKY:** I'd like to mark this  
 3 as GMD Exhibit 81, add it to our notebook.  
 4 (GMD Exhibit Number 81 Marked for  
 5 Identification.)  
 6 **MR. STUCKY:** And just for the  
 7 record, this exhibit was previously  
 8 furnished to the other parties in this  
 9 room. It's a new exhibit that we're adding  
 10 to our notebook.  
 11 **BY MR. STUCKY:**  
 12 Q. Would you -- can you tell me by looking at  
 13 Exhibit 81 what it is? And if I were to tell  
 14 you that it's use reports for the Bentley well  
 15 field and the E&S well field, would you have a  
 16 reason to disagree with that statement?  
 17 A. No, and I'll describe them for the record here.  
 18 The piece of paper that I have in front of me  
 19 currently looks like it is a WIMAS Water Right  
 20 Information Sheet, which is a online database  
 21 that DWR and KGS, I believe, host. The printouts  
 22 that I have in front of me are for, looks like  
 23 water right 45296, 45297, Sedgwick 1, and 42879,  
 24 so that gave me a little time to digest.  
 25 Q. Based --

1 authorized quantity is for the Bentley well  
 2 field?  
 3 A. I don't have that off the top of my head.  
 4 Q. Can these sources be used during a time of  
 5 drought?  
 6 A. We can sure try. I mean, that's -- that's the  
 7 spirit of -- I mean, we can try. If they're  
 8 available and the water quality and the  
 9 drought -- or the specific triggers for flow in  
 10 the case of the Bentley reserve field, we could  
 11 try. Is it appropriate to assume that they are  
 12 going to be available in drought in terms of  
 13 resource planning? No. Do I think that could  
 14 we try and use them if they're available and  
 15 water quality for that day allows for the  
 16 blending of those resources? Sure, I think the  
 17 City would probably try that. But to count on  
 18 that from a firm planning standpoint, no, it  
 19 wouldn't be appropriate.  
 20 Q. Do you know if the Bentley well field and the  
 21 E&S well field were used -- were used in 2011  
 22 and 2012?  
 23 A. I believe they tried, yeah.  
 24 **MR. STUCKY:** May I approach the  
 25 witness?

1 **MR. STUCKY:** Well, first of all, I'd  
 2 like to move to admit the District's  
 3 Exhibit 81 into evidence.  
 4 **PRESIDING OFFICER:** Any objections?  
 5 **MR. MCLEOD:** I'm going to object  
 6 just on the basis and the point that when  
 7 Counsel says previously furnished, he means  
 8 just before the hearing today, and we, you  
 9 know, have had issues with scheduling. It  
 10 is just hard to conceive that in the  
 11 massive set of exhibit books that the  
 12 District put together they couldn't have  
 13 timely included this exhibit.  
 14 **PRESIDING OFFICER:** Your response.  
 15 **MR. STUCKY:** I guess my response was  
 16 that at the last hearing there was certain  
 17 exhibits that we were furnished right  
 18 before the hearing and just based on the  
 19 fact that there was substitute exhibits or  
 20 additional exhibits that we received right  
 21 before the hearing, we didn't object on  
 22 those grounds alone.  
 23 And, of course, this -- there's a  
 24 voluminous amount of exhibits that are  
 25 included here, and this aspect of the

Page 887

1 authorized quantity and the past use for  
 2 the E&S well field and the Bentley well  
 3 field, that more recently came to our  
 4 attention as something that perhaps that  
 5 would be relevant to discuss.  
 6 So we're asking that -- and,  
 7 additionally, there was no requirement in  
 8 this administrative hearing that the  
 9 exhibits be furnished in advance. We tried  
 10 very hard to do so, and we gave all our  
 11 exhibit notebooks in advance of the  
 12 hearing, we did our best to do so, but  
 13 there was no strict requirement of when  
 14 they be furnished. And so we're asking  
 15 that it be admitted and that that's not a  
 16 grounds for the objection.  
 17 **PRESIDING OFFICER:** And give me just  
 18 a minute.  
 19 **MR. MCLEOD:** Madam Hearing  
 20 Officer --  
 21 **PRESIDING OFFICER:** Yes.  
 22 **MR. MCLEOD:** -- I would just like to  
 23 say by way of rejoinder, I don't think what  
 24 Counsel has said is accurate as concerns  
 25 any exhibits from the City. I don't

Page 888

1 believe that the City has provided exhibits  
 2 just prior to the hearing at any stage of  
 3 the proceedings.  
 4 **PRESIDING OFFICER:** Mr. Stucky, as I  
 5 understand it, these documents are derived  
 6 by DWR, they are statements of fact and  
 7 reported usage of the water rights, some of  
 8 the water rights, at least, that are at  
 9 issue in this case; is that right?  
 10 **MR. STUCKY:** That is correct.  
 11 **PRESIDING OFFICER:** Okay. In light  
 12 of the fact that I had previously taken  
 13 administrative notice of orders issued by  
 14 or on behalf of the chief engineer,  
 15 specifically the approved water permits for  
 16 the ASR Phase I and Phase II project,  
 17 including official written explanations,  
 18 transmission documents, findings and  
 19 orders, to me this would fall closely  
 20 enough within that category, so I'm going  
 21 to allow them. Thank you.  
 22 **BY MR. STUCKY:**  
 23 Q. As you look, Mr. Clement, at Exhibit 81, could  
 24 you tell from having looked at Exhibit 81 what  
 25 the authorized quantity is both for the E&S well

Page 889

1 field and the Bentley well field based on  
 2 looking at these documents?  
 3 **A. I would -- so the E&S well field has a number of**  
 4 **water rights, with water rights limitations, I**  
 5 **don't have that net quantity limitation in front**  
 6 **of me. So while this does show authorized**  
 7 **quantity, I'm not sure that it shows the net**  
 8 **quantity. So for that, I -- it's not that I'm**  
 9 **going to decline to answer, I just don't know.**  
 10 **Without that net quantity and the actual, maybe,**  
 11 **certificate in front of me, it would be**  
 12 **speculation on my part to tell you what the**  
 13 **authorized quantity would be.**  
 14 Q. So there's multiple wells for both the E&S well  
 15 field and the Bentley well field, and to  
 16 determine what that total authorized quantity  
 17 is, you would have to add up the authorized  
 18 quantities for all those wells, is that -- is  
 19 that what you're saying?  
 20 **A. No, that'd be inaccurate. Again, speaking to**  
 21 **how complex municipal water rights and even some**  
 22 **ag water rights can be, you can have a lot of**  
 23 **individual authorized quantity. In other words,**  
 24 **let's say we've got three wells that are 1,000**  
 25 **acre-feet apiece, you -- you want flexibility in**

Page 890

1 **how you can take water in the municipal**  
 2 **industry, so that's how each individual water**  
 3 **well, if we just added them all up, maybe it**  
 4 **would sound like we're authorized for**  
 5 **3,000 acre-feet in that instance, in that**  
 6 **hypothetical, but in reality there could be a**  
 7 **net limitation clause, there could be something**  
 8 **that is either part of the permit condition or**  
 9 **certificate for that particular water right that**  
 10 **limits it to something less than that.**  
 11 **So in other words, we've got 3,000**  
 12 **acre-feet that we could pump if you just summed**  
 13 **the individual wells together; however, there**  
 14 **are cases, and I believe it is the case with E&S**  
 15 **and perhaps even Bentley, where some of those**  
 16 **water rights may be limited back to a net**  
 17 **clause, which is -- I don't see that in front of**  
 18 **me.**  
 19 Q. Well, let's talk about, just a little bit about  
 20 this document. On the very first page, there's  
 21 a water right number; is that right?  
 22 **A. So the page that I have in front of me is**  
 23 **reference to water right 45296.**  
 24 Q. And in the comment on this document, it says  
 25 it's part of the Bentley reserve well field, is

1 that -- would you also agree with that?  
2 **A. It appears to be referring to Bentley reserve**  
3 **well field 2 in the comment section.**  
4 Q. And at the bottom of that document, toward the  
5 bottom right-hand portion of that document, it  
6 shows that there's water use in the Bentley  
7 reserve well field -- at least for this specific  
8 water right in the Bentley reserve well field,  
9 it shows water use in 2011 and 2012. Can you  
10 tell me what those numbers are?  
11 **A. For this particular page, 281.5 acre-feet in**  
12 **2011; and 2012, it looks like a reported value**  
13 **of 58.9.**  
14 Q. And if we flip to the next page of this  
15 document, there's a different water right  
16 number, which is 45297, and it also indicates  
17 it's part of the Bentley reserve well field  
18 number 2. Is that an accurate statement?  
19 **A. According to the comments, yes.**  
20 Q. And for this particular water right, would you  
21 agree that the use in 2011 and 2012 was  
22 368.47 acre-feet and 123.45 acre-feet  
23 respectively?  
24 **A. As reported on the page, yes.**  
25 Q. And if we were to flip to the very next page, in

1 Q. And if we flip to the very next page and look at  
2 this additional well, what is the use in 2011  
3 and 2012, what are those numbers?  
4 **A. 794 and 284.**  
5 Q. Flip to the next page, what are -- what is the  
6 use for 2011 and 2012?  
7 **A. 766 and 145.**  
8 Q. Acre-feet?  
9 **A. Yes.**  
10 Q. And on the very next page for 2011 and 2012?  
11 **A. Referring to the very next page, which would**  
12 **refer to in the comment section as well**  
13 **number 4 -- or well number N-4, 2011 and 2012**  
14 **would be 94.68 and 95.6.**  
15 Q. And if we flip to the very next page, what is  
16 the water use for 2011 and 2012 for this  
17 separate well in the E&S well field?  
18 **A. It appears that zero in -- I'm looking at the**  
19 **page that says, in the comment section, 100 feet**  
20 **south of previous point of diversion, so I don't**  
21 **know which well this is for, but that is what's**  
22 **in the comment section, and the year 2011 is**  
23 **zero, and the year 2012 is 136.**  
24 Q. Same question for the very next page?  
25 **A. Looks like 2011 is 200 and 2012 is 5.**

1 the very next page there's a water right number  
2 at the top that says SG 1-00. If I were to tell  
3 you that this was part of the E&S well field,  
4 would you have reason to disagree with that  
5 statement?  
6 **A. According to the comments here, it describes it**  
7 **as well number S-1 in lot 4, southeast of the**  
8 **southeast of the southwest. So that appears to**  
9 **be coordinating to one of the S wells,**  
10 **specifically S-1.**  
11 Q. And that would be part of the E&S well field?  
12 **A. Yes.**  
13 Q. And in 2011 and 2012, there's -- there's  
14 acre-feet of water that were used from this --  
15 from this particular well. What is that  
16 acre-feet that's shown?  
17 **A. 797 for the year 2011 and for the year 2012,**  
18 **246.**  
19 Q. And if we flip to the very next page, there's  
20 a different -- well, yeah, there's a different  
21 well within that E&S well field that's depicted  
22 on this very next page, what is the water use in  
23 2011 and 2012 with respect to those additional  
24 wells?  
25 **A. Looks like 794 and 270.**

1 Q. And then for the final page, same questions for  
2 2011 and 2012?  
3 **A. The final page for 42879 is the water right**  
4 **number, it looks like 2011 is 874 and 2012 is**  
5 **131.**  
6 Q. So would you at least agree with me that during  
7 2011 and 2012, there was a significant amount of  
8 acre-feet of water that was utilized out of the  
9 Bentley well field and the E&S well field?  
10 **A. I wouldn't say significant, I would say they**  
11 **were used.**  
12 Q. If we were to add up the amount of acre-feet  
13 that you just went through as you mentioned  
14 those numbers, would you agree that the  
15 acre-feet was in the thousands, if we were to  
16 add it all together?  
17 **A. Sure.**  
18 Q. And are you saying that acre-feet in the  
19 thousands is not significant?  
20 **A. I'm saying acre-feet in the thousands relative**  
21 **to the way the City is forced to plan, the City**  
22 **must make water for its users, there's no doubt**  
23 **there. How we look at the year 2060 and how the**  
24 **drought will impact water resources is taken**  
25 **care of within the model and water resources**

Page 895

1 planning that was done by the City.  
 2 As I mentioned previously, both the Bentley  
 3 reserve well field and the local well field have  
 4 both water quantity and quality challenges, and  
 5 my review of the document just now noticed that  
 6 in specifically 2011 there was a higher value of  
 7 usage, at least in trend from my glance at the  
 8 document, as compared to 2012, and that would be  
 9 consistent with declining yields and water  
 10 quality that would be in both of those  
 11 resources. So from a planning perspective, it  
 12 makes sense that the City is looking at the  
 13 value of those resources relative to what they  
 14 mean for not only producing just wet water but  
 15 also water quality and then the role of that  
 16 resource during drought as a firm source of  
 17 supply.  
 18 So while the City was able to use the water  
 19 obviously from some of those resources in 2011  
 20 and 2012, from a prudent planning standpoint,  
 21 the City opted to look at what is the demand  
 22 associated with pumping much better water  
 23 quality from the Equus Beds and Cheney relative  
 24 than trying to use those resources. It doesn't  
 25 mean the City can't use those resources; it's

Page 896

1 just they're not going to be firm sources of  
 2 supply.  
 3 The value or the amount of water that can  
 4 be pumped from those resources, especially  
 5 during prolonged drought, I would anticipate to  
 6 decline precipitously. Meaning that during 2011  
 7 river flows were actually not terrible; they  
 8 were declining, certainly, during drought, but  
 9 the availability of that resource was more so  
 10 available than it would be in, let's say, 2012,  
 11 which follows with the water use trends. We're  
 12 going to see that continue to decline during  
 13 drought, at least during sustained, prolonged  
 14 drought, so the value of those resources may not  
 15 be adequately represented by just looking at  
 16 2011 or 2012 in this instance; we would have to  
 17 look at the yield of those resources in detail  
 18 and how they would serve the role of that  
 19 eight-year drought.  
 20 And we did that during our evaluation  
 21 process. It was my recommendation and during  
 22 review of the role of those resources that we  
 23 would just assign that demand to the Equus Beds  
 24 well field knowing that they were not firm  
 25 sources of supply. Can we use those resources

Page 897

1 and is that a benefit to everyone if we have the  
 2 opportune moment to do that? If water quality  
 3 standards can be met where the City could  
 4 utilize those resources, I think they would  
 5 probably do that. But do we want to count on  
 6 those from a municipal planning standpoint as  
 7 that is a guaranteed, let's say your example of  
 8 5,000 acre-feet? Probably not from a prudent  
 9 planning standpoint.  
 10 Q. Just a moment ago, you said with respect to the  
 11 City's modeling that you assigned the use from  
 12 the Equus Beds -- or from the E&S well field and  
 13 the Bentley well field to the aquifer, that you  
 14 would assign that use to the aquifer itself, is  
 15 that what you just said?  
 16 A. Essentially the demands that are generated in  
 17 the report came from the City and the City said,  
 18 here's how we're going to do those allocations.  
 19 So did I personally assign them? No, the City  
 20 said, here's how we're going to operate, here's  
 21 how we're going to take resources at different  
 22 pieces of time throughout the drought based on  
 23 2060 demands. Did I do that? No. Do I think  
 24 that allocation of splitting it between the two  
 25 major resources that the City has is reasonable?

Page 898

1 Yes.  
 2 Q. So if I were to ask you the question this way,  
 3 if the City were to, let's say, at 3,000  
 4 acre-feet, let's just use easy numbers, 3,000  
 5 acre-feet, let's say hypothetically it could  
 6 come from the E&S well field and the Bentley  
 7 reserve well field, let's assume for a moment,  
 8 and that 3,000 acre-feet under the City's  
 9 modeling and proposal is assigned to the  
 10 aquifer, would you agree with me, at least, that  
 11 if we reassign that 3,000 acre-feet from the  
 12 aquifer and instead take it from the E&S well  
 13 field or the Bentley well field, that would at  
 14 least reduce the demands on the aquifer?  
 15 A. It would reduce the demands, yes.  
 16 Q. And so I guess my question is why, if there was  
 17 use of the E&S well field and the Bentley  
 18 reserve well field in 2011 and 2012, why  
 19 weren't -- why wasn't that considered as a  
 20 source of supply, and why weren't those  
 21 acre-feet accounted for with the E&S well field  
 22 and the Bentley reserve well field?  
 23 A. So I'm going to try and be thorough just so we  
 24 can kind of keep things moving. So firm source  
 25 of supply is an industry term that says that

1 resource will be there day in and day out; the  
2 yield of that resource, the rate at which you  
3 can get it, it's guaranteed based on the  
4 hydrologic components of that resource. That is  
5 the definition to me of a firm source of supply,  
6 you have the water rights for it, hydraulically  
7 it can support it, you have the wells that can  
8 get it out of the ground in this example.  
9 Everything about that resource is firm, it can  
10 be counted on day in, day out, you have that  
11 resource tied up, it is -- it is very much firm.

12 So in terms of the Bentley reserve well  
13 field and the local well field, I would  
14 characterize the water rights and some of the  
15 other things associated with that very, very  
16 much based on river flow. Again, we're talking  
17 about an alluvial well field, so it is -- the  
18 yield of that resource is based on water flow in  
19 the river. As water flow in the river declines,  
20 so does the yield of the wells, so does the  
21 water quality in this instance, with natural  
22 salts occurring in the Arkansas River. For  
23 those two reasons, I would not classify both the  
24 Bentley reserve well field or the local well  
25 field as firm resources in terms of can you

1 Q. You indicated in your report and in the proposal  
2 itself that with respect to the 1 percent  
3 drought simulation, the data set for 1933 to  
4 1940 was not complete enough or had more limited  
5 availability and it couldn't be used; is that --  
6 is that true?

7 **A. That's correct.**

8 Q. However, is it -- is my understanding correct  
9 that data with respect to MODSIM modeling for  
10 Cheney was used between 1933 and 1940?

11 **A. That was not my work product. That's my  
12 understanding that basically the 1930s data, to  
13 the extent John Winchester could get it, obtain  
14 it, and use it, I believe that's -- that's how  
15 it was developed and used. I did not personally  
16 develop a review or put together any of the data  
17 that was used as the resource evaluation or flow  
18 values for Cheney so I can't speak to that, but  
19 that's my understanding is that 1930s data was  
20 used in the MODSIM model.**

21 Q. So as far as the question goes why that data set  
22 was appropriate for Cheney but not for the  
23 aquifer, that question is best left for  
24 Mr. Winchester?

25 **A. I believe so.**

1 count on the yield that's associated with those  
2 resources as a day in, day out, guaranteed  
3 source of supply, the answer would be no.

4 And so relative to prudent municipal  
5 planning, relative to what are reasonable  
6 bottoms for the ASR storage project area, when  
7 we look at how we might use water resources,  
8 especially during drought, from my perspective  
9 as a geologist and working on water supply in  
10 industry, would I recommend to a client that  
11 they plan on anything but having firm water  
12 resources in terms of planning an evaluation in  
13 terms of the drought model, my answer would be  
14 no.

15 Now, do we have the opportunity to take  
16 from Bentley and the E&S well field? Maybe, the  
17 answer is maybe. But when the question is what  
18 are the reasonable bottoms for the project, what  
19 are -- what are the worst-case scenario -- what  
20 worst-case scenario do we think we might  
21 actually be in based on drought, we wanted to be  
22 thorough and prudent in our projections to make  
23 sure that we had those resources accounted for  
24 in a capacity that was not firm. So I hope that  
25 answers your question.

1 Q. With respect to the MODSIM-DSS modeling and  
2 model, is it your belief that it's reliable?

3 **A. Well, in terms -- please define reliable for me  
4 so I can help you.**

5 Q. Well, from a scientific standpoint, do you  
6 believe that -- and I assume in college you took  
7 a course in statistics, and reliable was a term  
8 of art in statistics; is that -- is that true?

9 **A. You might rephrase your question so I can help  
10 you.**

11 Q. From a statistical standpoint, as the term  
12 reliable is known in statistics, do you believe  
13 that the MODSIM-DSS model results are generally  
14 reliable?

15 **A. I'm going to say yes, and I'm going to  
16 characterize what MODSIM is and what it isn't  
17 real quick. Models can be very scary black box  
18 if you don't know what they are, so I'm going to  
19 talk about what MODSIM-DSS is. Again, I did not  
20 run the MODSIM-DSS model for the specific  
21 projections and demands that were supplied to  
22 Burns & McDonnell so we could run the Equus Beds  
23 model, but I am familiar with what MODSIM-DSS  
24 is. And programs like MODSIM are extremely  
25 common, especially in western states where water**

Page 903

1 is scarce.  
 2 Basically, what MODSIM does is it allows  
 3 for allocations of resources strategically.  
 4 That could be as simple as, let's say, an  
 5 irrigation district that is set up on a  
 6 reservoir, is it going to rain tomorrow, is it  
 7 going to rain in two weeks? Once you take water  
 8 from that reservoir, it's essentially gone, but  
 9 it also might evaporate.  
 10 So you can make strategic decisions on how  
 11 you use water supply resources based on things  
 12 like forecasting and modeling, such as  
 13 MODSIM-DSS. It is essentially a calculator on  
 14 steroids that allows the user to use a GUI, or  
 15 graphical user interface, as a form to do the  
 16 programming and represent the  
 17 interrelationships, such as pipeline capacity,  
 18 permit conditions, and cost of those resources.  
 19 That is what MODSIM-DSS is.  
 20 Do I think that MODSIM-DSS in this case  
 21 fits the needs of the proposal in terms of its  
 22 reliability, its accuracy? Yes, essentially  
 23 because it's no more than, as I just mentioned,  
 24 a calculator on steroids. The reservoir  
 25 condition, the reservoir tables, I believe, are

Page 904

1 built into MODSIM in this case, so we know what  
 2 the storage values are, we know what evaporation  
 3 is going to happen at Cheney.  
 4 Same thing with the Equus Beds, we have the  
 5 permit conditions represented, we have the  
 6 pipeline capacity represented. Each one of  
 7 those things that you have to think about as a  
 8 utility is essentially represented within the  
 9 model. And what the model allows you to do is  
 10 run a forecasted simulation based on your  
 11 outcome-based decisions.  
 12 I want to manage Cheney at a certain level,  
 13 I want to manage the Equus Beds at a certain  
 14 level, different resources have different costs,  
 15 different resources such as the ASR credits may  
 16 go away over a certain period of time. What  
 17 MODSIM allows you to do is program all of those  
 18 things in code into what becomes essentially a  
 19 fancy Excel spreadsheet or a calculator. And so  
 20 from that standpoint, the ins, the outs, the  
 21 outputs, the capability to review what becomes  
 22 essentially a simple calculator is reliable.  
 23 Q. Okay. And I think you mentioned that you didn't  
 24 actually do the MODSIM modeling in this case or  
 25 do any of that MODSIM modeling; is that true?

Page 905

1 A. I am familiar with the model and how it works,  
 2 and certainly models like this, the decision  
 3 support tools are used in other places  
 4 throughout especially the Midwest where things  
 5 are scarce, especially water supply. It's not  
 6 uncommon to use models like this on a weekly or  
 7 a daily basis to figure out where you can  
 8 strategically take your water supply to the best  
 9 value of not only the resource but your  
 10 customers.  
 11 Q. But with respect to the City's modeling, you  
 12 didn't do the MODSIM modeling; is that right?  
 13 A. Not as it relates to the demands that were  
 14 supplied to the MODSIM model that were supplied  
 15 to the Equus Beds model.  
 16 Q. So I'm trying to save you some time,  
 17 Mr. Clement.  
 18 A. Sure.  
 19 Q. If I were to ask you a whole series of technical  
 20 questions about the MODSIM modeling, that  
 21 wouldn't be your field of expertise; is that  
 22 right?  
 23 A. I'm familiar with what MODSIM is. Did I make  
 24 the demands that were generated from the MODSIM  
 25 model, did I run the MODSIM model which

Page 906

1 generated the demands for the Equus Beds well  
 2 field groundwater modeling portion of the  
 3 project? No, I did not.  
 4 Q. Let's go to table 2-5 of the City's proposal,  
 5 and that's found on page 2-10.  
 6 A. Okay.  
 7 Q. And perhaps to just refresh a little bit, in the  
 8 third year of this modeling, the demand by the  
 9 City for water demand was the highest in the  
 10 third year, is that right, in this particular  
 11 table?  
 12 A. With respect to which resource or just total?  
 13 Q. Total resources?  
 14 A. Okay. Looks like -- so you're talking about not  
 15 the -- not the very last row, 'cause, again, we  
 16 have a -- we have a net demand to the City that  
 17 is the last row, so that is, okay, we know in  
 18 year 2060, we think we're going to need about  
 19 81,000 acre-feet of water supply. That number  
 20 changes based on conservation and how the City  
 21 is conserving their water supply. I don't have  
 22 a calculator in front of me, it looks like year  
 23 three, with total Equus Beds demand, which would  
 24 include the base water rights and ASR credits,  
 25 is roughly 60,000. Plus in this case 11,000.

1 I'd have to verify what the numbers are here  
2 because it looks like that 81,262 is being  
3 driven down by conservation. So, actually, year  
4 one would be the highest because it's not in  
5 conservation yet.

6 Q. Just -- and, I'm sorry, let's go to column -- or  
7 row, rather, one, two, three, four, five, six,  
8 seven where it says total EBWF and ASR. At  
9 least in year three with respect to those two  
10 components, the acre-feet is the highest in year  
11 three; is that right?

12 A. Yes.

13 Q. And so at the very bottom of this table, that  
14 shows total use and total demand out of both  
15 Cheney and the Equus Beds well field at the  
16 bottom of this table; is that right?

17 A. I believe so.

18 Q. Now, in this table, in year four, there is a  
19 stage 2 -- there's stage 2 drought planning that  
20 goes into effect; is that right?

21 A. Yes.

22 Q. And in year three, we're just in stage 1; is  
23 that right?

24 A. According to the City's MODSIM projections, that  
25 would be accurate.

1 Q. Now, in year four, which is stage 2, is it your  
2 understanding of the different stages of the  
3 City's drought planning that less water would be  
4 used in stage 2 versus stage 1?

5 A. Yes, you're reducing a net demand, an initial  
6 demand of, in this case roughly 80,000  
7 acre-feet. The way you reduce that demand is  
8 with conservation, so yes.

9 Q. So with that answer being yes, can you explain  
10 to me, then, if we go to the bottom of this  
11 table and we look at total demand in the end of  
12 year -- year three, which is 71,116 acre-feet,  
13 and then we look at year four after the stage 2  
14 is put into effect and that demand actually goes  
15 up to 71,890 acre-feet --

16 A. Uh-huh.

17 Q. -- can you explain to me why, then, the demand  
18 would go up after stage 2 is put into place?

19 A. Sure, I believe I can explain that. I think,  
20 and, again, I didn't create the demand results  
21 for this, but I would speculate, I believe it is  
22 the condition that -- remember, we have two  
23 separate models here. We have the MODSIM-DSS  
24 model, which is producing the demands to be used  
25 within the Equus Beds groundwater model. So

1 that last row where we have essentially a base  
2 demand of 80,000 acre-feet that is being nicked  
3 down based on conservation.

4 During that period, those -- the stress  
5 periods that we see at the top, MODSIM-DSS is  
6 not repeating the same year, so we have  
7 different hydrologic years that are being  
8 simulated there. Remember, we're talking about  
9 the 1930s drought, so those years are going in  
10 sequence, so the demand that's assigned with  
11 those years is going to be based on the  
12 hydrologic components of those years. So some  
13 years may be drier than others. The condition  
14 of Cheney Reservoir may be different than  
15 others. So that's where that difference is  
16 coming from.

17 So if we -- if we kept everything the same  
18 and we just said, okay, we're going to -- let's,  
19 for example, simulate year 1935, you would  
20 expect those numbers to be uniform. But we're  
21 seeing those numbers change because we're  
22 simulating the 1930s drought, and so the 1930s  
23 drought, year one may have a different demand  
24 than 1930s year -- drought year number two.  
25 That's basically what we're saying here is

1 inflows to Cheney, the hydrologic components,  
2 total demand, the temperature during the day,  
3 you know, irrigation requirements for people's  
4 grass, things of that nature, those are  
5 changing, it's not static, that's why the  
6 numbers are different. I hope that -- that  
7 helps.

8 PRESIDING OFFICER: I'm confused.

9 A. Okay. So the MODSIM-DSS is basically just  
10 saying where are we going to get, in this  
11 instance, 80,000 acre-feet of base demand from.  
12 There are a couple different ways to do that.  
13 We can get water from Cheney, we can get water  
14 from the Equus Beds, we can get water from ASR  
15 credits, we have a base demand of 80,000  
16 acre-feet. That demand gets reduced by the  
17 City's drought management plan.

18 So his question was why do we see values go  
19 up in year four from 71,000 to 70 -- let's call  
20 it 72,000 for rounding. It's because the  
21 MODSIM-DSS model isn't simulating the same year  
22 every year and the hydrologic conditions that  
23 are associated with that. Remember, we're using  
24 the drought years of the 1930s drought, so we're  
25 seeing hydrologic conditions change. Some years

Page 911

1 are wetter than others.  
 2 And so my guess would be that in year four,  
 3 things might have been drier than the previous  
 4 year, ergo the demand went up. Despite the  
 5 conservation value, we do see a small increase.  
 6 I would have to look at the values and the  
 7 outputs of the MODSIM model, but it's not a  
 8 static demand through that entire period. They  
 9 are simulating the 1930s drought, the river  
 10 flows associated with that, the temperatures  
 11 associated with that, and the changing demands  
 12 associated with that on a daily basis so that I  
 13 would anticipate a different value, not the same  
 14 value.  
 15 **PRESIDING OFFICER:** And forgive me  
 16 if I'm not tracking, but if we're using --  
 17 or they were using the 1930s values, I  
 18 thought they were using 2011 and 2012 to  
 19 simulate the 1930s values?  
 20 **A.** So, yes, so we have two different models. So  
 21 our role at Burns & Mac was to say, what is the  
 22 impact to just the aquifer based on, City, what  
 23 do you think you will actually need in year  
 24 2060? So we're going to talk about the  
 25 MODSIM-DSS model, forget about the groundwater

Page 912

1 model for now, separate model, so let's focus on  
 2 the MODSIM-DSS model and what it is. It is  
 3 simply a decision support tool that says under a  
 4 given set of conditions, water rights  
 5 conditions, pipeline capacity, drought response  
 6 plan, all the elements of the City's water  
 7 supply planning process, how those all interact  
 8 and interrelate, that's essentially what the  
 9 MODSIM-DSS model is.  
 10 So we can look at we have demands in 2060,  
 11 now we can say, okay, well, in 2060 if we have a  
 12 1 percent drought, what does that look like, how  
 13 are we going to manage that, how are we going to  
 14 get through that? Based on our current  
 15 policies, based on our current infrastructure,  
 16 how do we think we can best get through that?  
 17 MODSIM, that particular model, allows for the  
 18 interrelation of all of those things, so there's  
 19 code that says, well, on a certain day, I can  
 20 pump this much from Cheney to make my water  
 21 treatment plant process blend at this certain  
 22 rate. On a certain day, given certain demands  
 23 of 81,000 over, let's say, the year, how are we  
 24 going to meet that demand based on water rights,  
 25 all of those considerations.

Page 913

1 What's happening during that period is  
 2 we're not repeating 2011 and 2012. If you  
 3 remember John Winchester's work where he said,  
 4 here is the 1930s drought, here's what we  
 5 simulated. He's taking those years and putting  
 6 them into the MODSIM model and saying, how would  
 7 those individual years, how would our -- how  
 8 would our demand and where we source water react  
 9 to those years, not 2011 and 2012? So that  
 10 answer fed the Equus Beds groundwater model in  
 11 terms of the total demands to, we don't simulate  
 12 Cheney, but the Equus Beds well field and ASR  
 13 credits. Have I gotten there yet?  
 14 **PRESIDING OFFICER:** I'm trying to  
 15 figure out, and forgive me, if the MODSIM  
 16 model is based on Mr. Winchester's data?  
 17 **A.** It is based on, yes, 1933, I believe, through  
 18 1940, so the reason we see changing demands is  
 19 because we're not keeping the hydrologic  
 20 conditions in MODSIM the exact same through year  
 21 one, two, three, four, five, six, seven, eight;  
 22 we're making them mirror, or Mr. Winchester and  
 23 the City, Mr. Macey did, made those values  
 24 mirror what actually occurred in the 1930s  
 25 drought. So that's why we see different demands

Page 914

1 from -- we see demands go up in certain years  
 2 and maybe drop in other years because we're  
 3 actually simulating the 1930s drought in that  
 4 portion. So the inflows to Cheney would have  
 5 been not the same every year; they would have  
 6 been different because each hydrologic year is  
 7 different.  
 8 **PRESIDING OFFICER:** So this  
 9 particular table does not reflect the use  
 10 of 2011 and 2012 repeated over and over?  
 11 **A.** The last line would not, it is representing the  
 12 MODSIM model, not the Equus Beds groundwater  
 13 model.  
 14 **PRESIDING OFFICER:** But doesn't the  
 15 math at the bottom of this chart come from  
 16 the rest of the chart? How can part of the  
 17 chart be derived --  
 18 **A.** Sure.  
 19 **PRESIDING OFFICER:** -- from one  
 20 model and another one from another --  
 21 **A.** So --  
 22 **PRESIDING OFFICER:** -- if there's  
 23 additional -- I mean, if there is a  
 24 mathematical relationship at the bottom?  
 25 **A.** Yes, there is. So the -- let's talk about what

1 the Equus Beds groundwater model is. So in  
2 order to predict what levels we wanted to look  
3 at for a change, we had to understand how much  
4 water the City is going to pump from the Equus  
5 Beds, whether that's from their normal base  
6 rights or in addition ASR credits. In order to  
7 get that, we said, City, how much do you think  
8 you're really going to need during, let's plan  
9 for the year 2060.

10 So in order to get that answer, before we  
11 could even start groundwater modeling to figure  
12 out what a reasonable bottom for the project is,  
13 we had to rely on the City to say, okay, you  
14 have this other tool, this -- this water  
15 resources planning tool that has all of the  
16 components from infrastructure and you can throw  
17 different hydrologic years at it, all it is is a  
18 calculator. It just says under a given set of  
19 circumstances, how would you take water from  
20 your different water resources based on your  
21 policies, based on the infrastructure that you  
22 have in the ground, pipelines and pumps, based  
23 on water rights, it can incorporate all those  
24 things.

25 So before we can even run the Equus Beds

1 can't use the 1930s data simply because it  
2 doesn't exist in the groundwater model, what can  
3 we use that might match up the best that we have  
4 for available record with improved data, with  
5 recent streamflows? That was the genesis of why  
6 we used 2011 and 2012 in the groundwater model.

7 On the MODSIM side of things, I believe  
8 John Winchester had some available data from the  
9 1930s on flow. I believe he had information on  
10 flows, river flows, and how Cheney reacted or  
11 would have reacted back in the 1930s, that was  
12 his work. But he used that specific period of  
13 the 1930s drought, I believe it was 1933 through  
14 1940, to say under those conditions -- remember,  
15 MODSIM says how are we going to balance our  
16 water resources, knowing all of these things  
17 that we can represent with mathematical computer  
18 code, things like water rights, things like  
19 pipelines, things like pumps, things like permit  
20 conditions, things like policy, things like  
21 cost, things like water quality, those are all  
22 included as considerations within the MODSIM  
23 model as code.

24 So I believe Mr. Macey's work and Mr. John  
25 Winchester's work basically used the values of,

1 groundwater model, we need to know what the  
2 demands we want to include are within the  
3 groundwater flow model, and that comes from the  
4 MODSIM-DSS process. And since in the Equus Beds  
5 groundwater flow model, we don't have the years  
6 of 1930s to build the drought variables within  
7 the complicated groundwater model -- the  
8 groundwater model is much, much, much more  
9 complex than the MODSIM model. MODSIM model is  
10 basically an Excel spreadsheet exercise. The  
11 groundwater model is a complicated flow program.

12 So trying to think of a best way to explain  
13 this, but we didn't have in the Equus Beds  
14 groundwater flow model, we did not have data, at  
15 least in the original coverages. We may have  
16 had, I believe, one or two precipitation  
17 stations but really nothing else for temperature  
18 and some of the other things that feed into  
19 accurate calculations for the Equus Beds  
20 groundwater model, the hydrologic variables that  
21 went into that.

22 So we had to use surrogate data, and in our  
23 case, we found that 2011 and 2012 fit nicely  
24 with the target PDSI values that were developed  
25 by the MODSIM model. In other words, if we

1 okay, under a scenario of planning for the year  
2 2060, we have roughly 80,000 acre-feet of  
3 demand. Okay, now let's say a drought occurs,  
4 let's simulate the 1930s drought with MODSIM,  
5 let's simulate the river flows into Cheney,  
6 let's simulate the hydrologic conditions and  
7 the -- and the dry and hot conditions that would  
8 increase things like municipal demand in the  
9 City. That's all included in the MODSIM model.

10 And so they ran that forward, I believe,  
11 for the period 1933 through 1940 to say what --  
12 what demand should we place on the Equus Beds  
13 Aquifer and ASR credits to optimally manage all  
14 of our resources, to meet all of our water  
15 quality goals, to meet all of our permit  
16 conditions, to meet all of our water rights  
17 obligations, and to make the best security for  
18 our customers to have two water resources  
19 available, the two biggest water resources  
20 available throughout drought.

21 So MODSIM is providing the genesis for the  
22 Equus Beds well field demands. So they are very  
23 much interrelated. They are separate but MODSIM  
24 is providing how -- how do we take water during  
25 a drought. Okay, Burns & McDonnell, run the

Page 919

1 **model and tell us if we take this much water**  
 2 **during a drought, what do the new bottoms look**  
 3 **like. Does that -- does that help?**  
 4 **PRESIDING OFFICER:** Thank you.  
 5 **BY MR. STUCKY:**  
 6 Q. So with -- and, again, your answer was much more  
 7 complicated than this, but at least as it  
 8 relates to table 2-5, at the top part of that  
 9 table, these are iterations of 2011 and 2012  
 10 that are mentioned up there, but as we move to  
 11 the bottom of that table, we're talking about a  
 12 different type of data set. Is that what you  
 13 said?  
 14 **A. Yes. And I can see how that would be confusing.**  
 15 **So if you wanted to, you know, apply the -- just**  
 16 **for that very last row, if you wanted to apply**  
 17 **the drought years of the 1930s to just that very**  
 18 **last row, I think that would be reasonable to**  
 19 **clarify what those values are representing for**  
 20 **the record.**  
 21 Q. And so in my simple mind, I looked at year three  
 22 and it says 2011 at the top of that data --  
 23 those numbers toward the top of that table, and  
 24 then in year four it says 2012. And just a  
 25 moment ago, we discussed the net irrigation use

Page 920

1 in table 2-6, which is on the following page,  
 2 and you mentioned that net irrigation use went  
 3 down in 2012 versus the use in 2011, and so I  
 4 guess I'm still having a tough time  
 5 understanding that -- how in year four, after we  
 6 implement a more drastic stage of drought  
 7 planning, why the City's water use would go up,  
 8 I'm still having trouble understanding that --  
 9 that answer?  
 10 **A. Okay. So I'm going to see if I can make a**  
 11 **description for the record so we can get**  
 12 **everything translated here. Give me just a**  
 13 **moment. Maybe a couple moments but ...**  
 14 Q. If you were to refer to table 2-3, does that  
 15 help you?  
 16 **A. I was going to try and pull essentially what was**  
 17 **represented from John's original work, but I**  
 18 **think 2-3 might have that same sequence of the**  
 19 **1930s representation. What page is that on?**  
 20 Q. Page 2-5 of your proposal.  
 21 **A. Yeah, okay. That would be table 2-3, which is**  
 22 **explaining how MODSIM works. So if you wanted**  
 23 **to, say, take that simulated calendar year of**  
 24 **drought row and take that row and copy it and**  
 25 **paste it just underneath the line of the table**

Page 921

1 **that we were talking about previously, I think**  
 2 **that would be an easy way to explain it.**  
 3 **So MODSIM is simulating the years of 1933,**  
 4 **1934, 1935, 1936, so it is not the same year**  
 5 **over and over and over. It is simulating the**  
 6 **hydrologic conditions of those particular years**  
 7 **to generate how the City reacts to those**  
 8 **hydrologic conditions to meet water demands from**  
 9 **various resources.**  
 10 Q. So as you're sitting here today, do you know as  
 11 these MODSIM numbers were calculated how the  
 12 City's drought stages were accounted for, do you  
 13 know the answer?  
 14 **A. I think that is represented in figure 2. You**  
 15 **can see that the red line goes up, so you can**  
 16 **see that the City is going into more severe**  
 17 **drought restrictions. The left side represents**  
 18 **the Cheney Reservoir storage; the right side**  
 19 **represents the stages of the City's drought**  
 20 **response plan that they are entering into. That**  
 21 **is a result of the MODSIM model. So it shows at**  
 22 **what times the City is entering into those**  
 23 **various stages of drought response.**  
 24 Q. Well, let's go back to table 2-3, and maybe  
 25 that'll help us to answer my question. In table

Page 922

1 2-3, at the very top of that table, it says,  
 2 baseline City demand in acre-feet. And as far  
 3 as baseline City demand in acre-feet, it says  
 4 81,690 in year one, and for every year from year  
 5 one to year eight, the baseline City demand is  
 6 still 81,690 acre-feet. Is that a true  
 7 statement?  
 8 **A. That is correct.**  
 9 Q. So that number, at least, doesn't change; is  
 10 that right?  
 11 **A. That is correct.**  
 12 Q. Okay. So to get to -- from the baseline demand  
 13 to the revised demand, do you know how one  
 14 arrives at those numbers, and did the stage 1  
 15 and 2 drought planning factor into those  
 16 calculations?  
 17 **A. It should be, yes.**  
 18 Q. But as you're sitting here today, you don't know  
 19 what those exact calculations were or how they  
 20 were made?  
 21 **A. I know that they're made within MODSIM; I'm not**  
 22 **the one who did them, so I wouldn't be able to**  
 23 **go into super detail. I mean, but you can tell**  
 24 **what's happening there. Essentially the City is**  
 25 **saying I'm going to plan in the year 2060 for**

1 **82,000 acre-feet of demand. That demand will be**  
2 **satisfied in a couple different ways from its**  
3 **major water resources. How they get there, how**  
4 **they allocate resources changes over time based**  
5 **on the inflows to Cheney and how Cheney responds**  
6 **over time since it is the major factor for how**  
7 **conservation is enacted.**

8 You can see that in figure 2 that increases  
9 logically as Cheney decreases in the first two  
10 to three years there, you can see that  
11 conservation number go up. So the revised City  
12 demand from drought response plan is what it  
13 says, I mean, it's -- it is the revised demand,  
14 essentially shearing, in most cases here, at  
15 least 10,000 acre-feet of demand just with  
16 conservation alone.

17 Q. On table 2-3 in year one, it mentions 110  
18 percent for the starting level for Cheney, and I  
19 think it was testified by Mr. Macey, as I  
20 recall, that that was merely a typo or an error  
21 in that table; is that true?

22 A. I believe that to be the case. When looking at  
23 figure 2, which is a direct output from the  
24 MODFLOW modeling spreadsheets is my  
25 understanding, that number on the left side

1 and that particular error wasn't corrected after  
2 that email either, and I think you were also  
3 included as one of those recipients. Do you  
4 have explanation for why it wasn't addressed at  
5 that point in time?

6 A. No. I mean, it is what it is, it's a typo; for  
7 the record, I think it's probably a carry-over.  
8 At the time when we were doing water resources  
9 planning, we were looking at the frequency that  
10 the pool was above 100 percent prior to  
11 occurrences of drought and how often that would  
12 occur during, let's say, early spring  
13 conditions. Basically, we came to the  
14 conclusion that prudent planning would say just  
15 go ahead and consider it roughly 100 percent  
16 full, don't mess with the allocations, it seems  
17 logical that it's going to be 100 percent. It  
18 would be great if we can do more than that  
19 because that just ultimately relieves pressure  
20 on the Equus Beds and any of the other  
21 resources, but for the purposes of planning and  
22 for the purposes of the report, just refer to it  
23 as 100 percent, and I believe it's just a typo.

24 Q. So there was, at least, one point in which you  
25 were considering starting Cheney Reservoir and

1 during the beginning of the drought is roughly  
2 160,000, 165, 167,000 acre-feet, just looking at  
3 it graphically, which would correlate to  
4 100 percent, not the 110 percent, so I believe  
5 that number of 110 percent to be a typo. As was  
6 testified by Mr. Macey, I believe that to be the  
7 case, it is a typo within the report.

8 Q. When Mr. Macey was on the stand, I asked him why  
9 that particular error wasn't corrected after  
10 receiving a July 18, 2017 email from Tim Boese  
11 from the Equus Beds Groundwater Management  
12 District, and I believe, and we can pull out  
13 that email, but I believe that you were one of  
14 the recipients of that email from Mr. Boese, so  
15 I guess I'm asking the same question to you, why  
16 wasn't that portion of the table corrected back  
17 at that time?

18 A. I don't know. This is -- looking at the report,  
19 and it is roughly 2 1/2 inches thick, so there's  
20 a lot of information and data there. During  
21 review and assembly of the proposal, it's a  
22 typo.

23 Q. And also in Sep -- I also introduced a September  
24 18, 2017 email from the chief engineer,  
25 Mr. Barfield, who also identified that error,

1 the conservation pool as higher?

2 A. Sure, yeah.

3 Q. Did you ever consider doing an addendum to the  
4 proposal to address some of those particular  
5 errors?

6 A. I mean, I think we could, and I think this is  
7 what the hearing process is for, addressing  
8 things like this just to make sure that  
9 everybody is on the same page and we have  
10 100 percent clarity. So we could have issued an  
11 addendum; I don't know if there would have been  
12 any value at this point since the hearing  
13 process was going to take place. But, I mean,  
14 I'm comfortable with calling it a typo and the  
15 process has brought forward an issue and we have  
16 taken care of it so ...

17 Q. Did you consider addressing some of those typos  
18 or errors when your expert reports were  
19 submitted or your supplemental expert reports  
20 were submitted, did you consider addressing it  
21 in those expert reports?

22 A. I guess not.

23 Q. So I guess my question is if there was  
24 consideration made at least at one point in the  
25 analysis for a situation where the conservation

Page 927

1 pool was, let's say, at 105 percent, which is  
 2 allowed by the Army Corps of Engineers, versus  
 3 100 percent, how can we be assured that this is,  
 4 in fact, just a typo and that the modeling is  
 5 indeed based on Cheney being full at 100 percent  
 6 versus 110 percent, how can we be assured at  
 7 that?  
 8 **A. I think if you look at figure 2 it clarifies the**  
 9 **issues. And, again, I didn't run or create the**  
 10 **MODSIM model in this particular instance. I**  
 11 **would base my opinion that it is a typo based on**  
 12 **figure 2 and my knowledge of the pool, the**  
 13 **conservation pool being roughly 167,000, I**  
 14 **think, off the top of my head. And that**  
 15 **correlates to the graph being 100 percent and**  
 16 **not 110 percent. So that would be my**  
 17 **justification for that value.**  
 18 Q. With respect to table 2-5, in the previous  
 19 testimony, it was also identified that there  
 20 were some errors in table 2-5. Is that a true  
 21 recharacterization of the previous testimony?  
 22 **A. I believe so. It was, I think, in the City of**  
 23 **Wichita ASR credit pumping field under model**  
 24 **stress period five simply a math issue where**  
 25 **we -- we have 56,579 of total Equus demand, and**

Page 928

1 **that should have been 16,579 in City of Wichita**  
 2 **ASR credit pumping, I believe we had that**  
 3 **corrected.**  
 4 Q. And in previous testimony, it was identified  
 5 that that was also brought to your attention on  
 6 April 12, 2018 and you were one of the  
 7 recipients of that email identifying that error.  
 8 Do you have any opinion or testimony as to why  
 9 those errors weren't corrected --  
 10 **A. Well --**  
 11 Q. -- if it was brought to your attention back in  
 12 2018?  
 13 **A. -- I think as you just mentioned, the proposal**  
 14 **was submitted, I'm looking at the front date**  
 15 **here, 3/12/2018, so the date you mentioned was**  
 16 **April, I mean, it -- the process, the hearing**  
 17 **process we have now was very much anticipated.**  
 18 **And I believe that it was coordinated with not**  
 19 **only DWR but GMD2 at the time that there was an**  
 20 **understanding. And so without reissuing,**  
 21 **restamping that product, we coordinated with the**  
 22 **agencies that we thought were appropriate to let**  
 23 **them know of that issue as soon as we knew about**  
 24 **it and so that everybody was on the same page.**  
 25 **And I think it's really just a matter of cleanup**

Page 929

1 **during the hearing, not necessarily a**  
 2 **re-issuance. It's not going to impact the**  
 3 **results. That's my logic.**  
 4 Q. Okay. And you would also, at least, acknowledge  
 5 that there were errors identified in table 2-10  
 6 in the previous hearing. Is that -- is that  
 7 also an accurate statement?  
 8 **A. Was that the one with the proposed levels, just**  
 9 **to speed things up?**  
 10 Q. It's on page 2-24 just to refresh your memory,  
 11 it had to do with errors in the contingencies.  
 12 **A. Okay, yeah, I think we had cleanup on that too.**  
 13 Q. Okay. So at least for my purposes, at the last  
 14 hearing back in December, those three days of  
 15 hearing back in December, for the first time for  
 16 all of our benefit, these errors were  
 17 acknowledged and identified by the City for the  
 18 first time during those previous three days of  
 19 hearings, so my question is we've had, you know,  
 20 a couple months of time that's elapsed since our  
 21 last hearing, have any additional errors or  
 22 aspects of your proposal that you wish you would  
 23 have changed or modified, has anything  
 24 additional come to your attention?  
 25 **A. Not that I know of.**

Page 930

1 Q. And if I asked you this, I apologize, but what  
 2 peer-review work was done with respect to the  
 3 modeling work performed by Burns & Mac?  
 4 **A. So we -- we have a QA/QC process, it's a formal**  
 5 **QA/QC process that goes through a digital**  
 6 **checklist, digital sign-offs. It's generally an**  
 7 **individual who may be familiar with, let's say,**  
 8 **the report or the project but did not write it**  
 9 **himself. So that person would have been Luca**  
 10 **DeAngelis, as he testified, was the QA/QC for**  
 11 **this. And so he QA/QC'd the general concepts,**  
 12 **such as are we using appropriate drought values,**  
 13 **are -- is pumping represented, is the model**  
 14 **being used for its intended purpose, general**  
 15 **spitballing of ideas. So that is QA/QC and who**  
 16 **did it, and it was a process that we had done.**  
 17 I will say if it's value to either the  
 18 hearing process, the hearing officer, or the  
 19 process in general, if you would like an  
 20 addendum that would be issued with any  
 21 corrections that we've identified to be -- that  
 22 we believe are accurate corrections, we could do  
 23 that. If there is value to the hearing process,  
 24 we'd be more than glad to do that.  
 25 Q. So during that peer-review process, did

1 Mr. DeAngelis, did he catch any errors in the  
 2 tables or in the modeling during that process?  
 3 **A. Not that I recall. I believe we added**  
 4 **streamflows and a couple other things just to be**  
 5 **more illustrative, just to speak more model**  
 6 **terms, knowing that others might want to review**  
 7 **the modeling aspects of it, not so much the**  
 8 **individual proposal pieces and tables but more**  
 9 **if another modeler wanted to take a dive into**  
 10 **it, just we had all the data represented. But**  
 11 **in general, no, I mean, that was it.**

12 Q. Was there other work done trying to assure that  
 13 errors would be eliminated in the modeling?

14 **A. I mean, Word, spell check, and stuff like that,**  
 15 **sure. But, I mean, it's just, it's a general**  
 16 **gut check on the roles of the model, the**  
 17 **capacity of the model to simulate what you're**  
 18 **asking it to simulate, the drought values that**  
 19 **were presented, I mean, general QA/QC.**

20 **PRESIDING OFFICER:** Could I ask --  
 21 sorry, I'm still working my way through all  
 22 this, and this may be a very oversimplified  
 23 view of things, as I'm looking at table  
 24 2-5, what it appears to me, if I understand  
 25 what you were saying, the row for total

1 Equus Beds and ASR, plus Cheney Reservoir  
 2 pumping equals the bottom row?

3 **A. I believe that's what's -- should be represented**  
 4 **there.**

5 **PRESIDING OFFICER:** So in order to  
 6 derive the total Equus Beds and ASR  
 7 pumping, the years 2011 and 2012 are used  
 8 for that? But for Cheney Reservoir, the  
 9 other data derived by Winchester and others  
 10 was used for that?

11 **A. No. So the demands, the total Equus Beds well**  
 12 **field and ASR, that particular row, those demand**  
 13 **numbers come from the basis for those numbers.**  
 14 **How do we know that we need 34,000 specifically**  
 15 **from the Equus Beds, those come from the MODSIM**  
 16 **model. Those values are put into the Equus Beds**  
 17 **model, so they are represented in the model, and**  
 18 **the other hydrologic things that are in the**  
 19 **Equus Beds model are repeated at 2011 and 2012**  
 20 **values.**

21 **PRESIDING OFFICER:** So one question  
 22 I have, and I was taking notes while you  
 23 were describing this a minute ago so I'm  
 24 sorry to go back, but in year five, you  
 25 identified or discussed an error that was

1 in this table. Can you remind me what that  
 2 error was and what the proper value should  
 3 be?

4 **A. I believe that in model stress period year five,**  
 5 **if we look at the total Equus Beds well field**  
 6 **and ASR acre-feet, that row, and go over to**  
 7 **stress period five, that number is 56,579. The**  
 8 **City's base water rights total 40,000 acre-feet.**  
 9 **So if we go underneath that, that value, we see**  
 10 **the row City of Wichita ASR credit pumping, that**  
 11 **value should be corrected. It's simply just a**  
 12 **math error, maybe a carry-over from a previous**  
 13 **model, MODSIM-DSS run. It looks like that value**  
 14 **should be 16,579 because that would be in**  
 15 **addition to the City's base water rights. So if**  
 16 **you can pump 40,000 acre-feet first, which would**  
 17 **make sense, you'd be left with 16,579 acre-feet**  
 18 **of demand that you would still need to get from**  
 19 **the ASR credits.**

20 **PRESIDING OFFICER:** But then why  
 21 wouldn't you apply that to the years before  
 22 that?

23 **A. So that -- that still follows. So if we look**  
 24 **at -- let's just go through it line by line real**  
 25 **quick. So in stress period one, in year one,**

1 **the total demand assigned to the Equus Beds**  
 2 **model, at least from the City's standpoint,**  
 3 **comes from MODSIM, that number is 34,202. The**  
 4 **City can take care of that with its base water**  
 5 **rights of 40,000 acre-feet so no -- no demand**  
 6 **from the ASR credits.**

7 **But the next year, we see 45,651 acre-feet**  
 8 **of demand from the MODSIM model, so we simulate**  
 9 **45,651 within the Equus Beds model, but the**  
 10 **City's water rights are only 40,000 acre-feet,**  
 11 **so they need 5,651 from ASR credits. So that**  
 12 **should follow that those two lines, the white**  
 13 **City of Wichita ASR credit pumping acre-feet**  
 14 **should be the delta between 40,000 acre-feet and**  
 15 **the line above it.**

16 **PRESIDING OFFICER:** So the  
 17 correction is not from the 56,579, the  
 18 correction should be the number below that?

19 **A. That's correct, yes.**

20 **PRESIDING OFFICER:** Okay. Now it  
 21 makes sense.

22 **A. Okay.**

23 **PRESIDING OFFICER:** Thank you, sorry  
 24 to interrupt.

25 **BY MR. STUCKY:**

Page 935

1 Q. You mentioned that Cheney, you assumed, would  
 2 start at 100 percent full from the modeling that  
 3 you performed, but with respect to the aquifer  
 4 itself, we were going to start at the 1998  
 5 levels which is -- makes the aquifer at 91  
 6 percent full. Is that a true statement?  
 7 **A. I don't know about the 91 percent off the top of**  
 8 **my head, but the 1998 was the starting condition**  
 9 **of the model, so that would be accurate.**  
 10 Q. So my question is for the modeling that you  
 11 performed with respect to the Equus Beds, why  
 12 were the 1998 levels selected versus assuming  
 13 that the aquifer would be 100 percent full when  
 14 the modeling started or the drought started?  
 15 **A. Well, from a standpoint of what is a reasonable**  
 16 **bottom for the project, if AMCs don't happen,**  
 17 **which I think could be reasonably assumed, we've**  
 18 **had opposition to that, if that does not happen,**  
 19 **still the reasonable bottom for the project,**  
 20 **regardless, is starting at some level that**  
 21 **facilitates, at least, the physical recharge**  
 22 **capacity of the system. So that was targeted at**  
 23 **roughly 30 million gallons a day of physical**  
 24 **recharge capacity at 1998 levels.**  
 25 **The problem with pumping the aquifer down**

Page 936

1 **to essentially recharge it is that you have to**  
 2 **over-excavate, it is not a one-to-one number.**  
 3 **So I believe that value was provided by the**  
 4 **City, we think based on 1998 levels that we can**  
 5 **roughly inject 30 million gallons a day of**  
 6 **sustained capacity to build the necessary**  
 7 **recharge credits available for drought. That is**  
 8 **why we started the model at 1998 conditions.**  
 9 **Also we see over time the aquifer has gone**  
 10 **up and down, so we wanted to have a bottom that**  
 11 **was representative of potentially dry**  
 12 **conditions. Just because you start at 1 percent**  
 13 **drought doesn't mean that it's going to be right**  
 14 **after a wet hydrologic period.**  
 15 **The goal of this entire proposal is to**  
 16 **facilitate aquifer levels at higher levels at**  
 17 **all times except for when it's needed, you're**  
 18 **pumping during drought, but we started the model**  
 19 **at 1998 conditions just to establish if we had**  
 20 **to continue recharging at 30 million gallons a**  
 21 **day, what would that number be so ...**  
 22 Q. So did you do a different modeling or different  
 23 modeled results for the aquifer at 100 percent  
 24 full versus, let's say, 91 percent full with the  
 25 1998 levels, did you do different modeling?

Page 937

1 **A. No.**  
 2 Q. Would it change the modeled results if you  
 3 assume that the aquifer started at 100 percent  
 4 full versus 91 percent full with the 1998  
 5 levels?  
 6 **A. Well, first of all, two things from the**  
 7 **perspective, you know, we'll never be at 100**  
 8 **percent full unless everyone stops pumping;**  
 9 **that's predevelopment, so that's probably not**  
 10 **going to happen. But from the perspective of**  
 11 **what was a reasonable bottom for the project**  
 12 **that assures that we understand the project can**  
 13 **function as needed, as it was designed, provide**  
 14 **drought resiliency for the City, and hopefully**  
 15 **not have to go through another hearing process**  
 16 **for the role of the project, it was prudent to**  
 17 **start with lower conditions rather than higher**  
 18 **conditions.**  
 19 **Again, the goal of the project, both**  
 20 **proposals here is to actually raise water**  
 21 **levels, maintain water levels higher, but from a**  
 22 **planning standpoint, it is much more**  
 23 **conservative to say the value of a very**  
 24 **expensive project, the value of the City's water**  
 25 **supply from a planning standpoint, from a**

Page 938

1 **hydrologist standpoint, from a groundwater --**  
 2 **from a geology standpoint, where have we been,**  
 3 **where have we seen water levels be, 1998, we**  
 4 **felt like, was a reasonable number to start**  
 5 **with.**  
 6 Q. So at least to answer my question, if we were to  
 7 assume that the aquifer was 100 percent full and  
 8 we did the modeling based on the aquifer being  
 9 100 percent full versus the 1998 levels, that  
 10 would impact or change the outcome of the  
 11 modeling. Is that a true statement?  
 12 **A. Sure, if you -- if you start water levels**  
 13 **higher, it's logical to assume that you'll end**  
 14 **with water levels higher as well.**  
 15 Q. In order to accumulate -- okay. So with the  
 16 City's proposal, there's a difference between  
 17 accumulating an aquifer maintenance credit on  
 18 one hand and physical recharge on the other  
 19 hand. Is that a true statement?  
 20 **A. Can you rephrase the question? And I'm going to**  
 21 **try and answer it for you, can you rephrase that**  
 22 **one more time?**  
 23 Q. Under the City's proposal, there is both the  
 24 physical recharge credit where water is injected  
 25 into the aquifer first on one hand, and on the

1 other hand, there's this aquifer maintenance  
2 credit where water is sent to the City and these  
3 aquifer maintenance credits are accumulated. In  
4 a very simplistic sense, would you agree there's  
5 a distinction between those two made in the  
6 City's proposal?

7 **A. Yeah, sure.**

8 Q. My question is this, what percent full under the  
9 City -- under the City's proposal does the  
10 aquifer need to be before an aquifer maintenance  
11 credit can be accumulated?

12 **A. I mean, in theory, it would roughly correlate, I  
13 believe, to the 1998 levels. I mean, at the  
14 point where you don't have physical recharge  
15 capacity to put it in the ground, there -- we  
16 can replace water that would otherwise not be  
17 pumped by taking that water to town. I would  
18 say if it is less than -- and we kind of took a  
19 shot at this in the operations plan, I mean, we  
20 have, I believe it was 34 MGD of recharge  
21 capacity. I -- we have a 30 MGD water treatment  
22 plant, if we can put it all in the ground, let's  
23 put it all in the ground. I think that is what  
24 the City is intending to do.**

25 **The problem is is under the majority of**

1 **water level conditions when things are shallow,  
2 we don't have that recharge capacity, so that  
3 would be the occurrence when the City would gain  
4 an AMC under the proposal is when we just simply  
5 don't have the physical recharge capacity in the  
6 existing system to do it.**

7 Q. Okay. So just in a simplistic sense for my  
8 understanding, if we go below the 1998 levels,  
9 we can have physical recharge, but if it's at  
10 the 1998 levels or higher, then the City would  
11 accumulate aquifer maintenance credits, is that  
12 what you're saying?

13 **A. Roughly. I mean, that's -- I think 1998 levels  
14 would correlate roughly with 30 MGD. Anything  
15 above that, we're going to start seeing decline  
16 capacity. I think the City has indicated they  
17 will, with all their effort, be able to try and  
18 put it in the ground, I mean, that is the  
19 number one priority of the City is to try and  
20 physically inject it. If the capacity of the  
21 system will simply not support that physical  
22 recharge activity due to water levels, that  
23 water needs to go somewhere. Again, the plant  
24 operates at either 15 million gallons a day or  
25 30 million gallons a day. It is still a benefit**

1 rewarded with a minimum index water level  
2 elevation at which they could pump credits, is  
3 that what you're saying?

4 **A. I don't know about rewarded. I mean, we have a  
5 world-class ASR project that we have the  
6 privilege to use here within Harvey County and  
7 Sedgwick County. We are at the forefront of ASR  
8 in terms of the Midwest, that is a excellent  
9 thing for the State of Kansas, for the City of  
10 Wichita, for every user here in the aquifer. I  
11 wouldn't say that it's a reward to get a lower  
12 elevation. I think what today is about, what  
13 this whole hearing process has been about is  
14 what is a reasonable bottom so that the project  
15 can be managed in a way that is beneficial to  
16 not just the City but everyone.**

17 **And then the other part of your question --  
18 what was the other part of your question?**  
19 Q. Well, in other words, would the City purposely  
20 pump the aquifer down during normal years and  
21 then pump it even lower in drought years under  
22 this proposal?  
23 **A. Right now we don't have an alternative if you're  
24 the City. I don't want to speak for the City, I  
25 think Don and Joe kind of touched on this, the**

Page 943

1 **problem with the way the existing permit**  
 2 **conditions are written, which is the genesis of**  
 3 **the proposal, let's try and do the right thing,**  
 4 **please don't force us -- right now the City has**  
 5 **to make ASR credits to have an additional**  
 6 **resource during drought. The role of ASR is**  
 7 **strictly for drought at this purpose and**  
 8 **currently with policy.**  
 9 **So relative to the ability to establish**  
 10 **those recharge credits, that is incredibly**  
 11 **important for the City in terms of drought**  
 12 **planning. We simply can't do it by maintaining**  
 13 **water levels where we're at at 97, 98 percent**  
 14 **full. Water levels have to go down in order for**  
 15 **us to establish physical recharge credits.**  
 16 **We just talked about the infrastructure**  
 17 **that governs that and from an engineering**  
 18 **standpoint how that works. So in order to lower**  
 19 **water levels, the City could, under its existing**  
 20 **rights, pump water levels down to make room, to**  
 21 **make storage space, to make recharge capacity**  
 22 **for those credits. This proposal is about not**  
 23 **having to do that, about coming up with a better**  
 24 **approach that we think will actually maintain**  
 25 **things fuller, except for those 1 percent**

Page 944

1 **drought occurrences where it's most needed.**  
 2 Q. So if we were to start the modeling with the  
 3 aquifer 100 percent full and you were to do the  
 4 modeling with the aquifer 100 percent full  
 5 versus the 1998 levels, would you at least agree  
 6 with me, if you were to redo the modeling with  
 7 the aquifer 100 percent full, that those minimum  
 8 index levels would be affected less soon if you  
 9 assume the aquifer was 100 percent full versus  
 10 the 1998 levels?  
 11 **A. Sure. Just to answer your question, and I think**  
 12 **I tried earlier, maybe I did, but if you start**  
 13 **at a higher groundwater elevation and apply the**  
 14 **same demands, let's say, to the aquifer, you**  
 15 **should end at a higher groundwater elevation,**  
 16 **that is logical, yes.**  
 17 Q. I think in your previous testimony when  
 18 Mr. McLeod was asking you questions, I think you  
 19 may have indicated that Mr. McCormick was better  
 20 qualified to testify as to the 30 MGD and how  
 21 that was selected. Was that what you previously  
 22 testified to?  
 23 **A. Not the 30 MGD. I believe you're talking -- go**  
 24 **ahead and ask your question one more time, make**  
 25 **sure I can try and answer it.**

Page 945

1 Q. Well, it's stated in the report that the 1998  
 2 groundwater levels are the minimum groundwater  
 3 levels to maintain 30 MGD, a physical ASR  
 4 recharge capacity. Is that -- is that what's  
 5 stated in the report?  
 6 **A. Yeah, and that was done -- basically, the City**  
 7 **reviewed and said, where do we think, based on**  
 8 **our existing infrastructure and what we know**  
 9 **about the wells, where do we think we could**  
 10 **sustainably inject that quantity, and that**  
 11 **starts at roughly the 1998 levels.**  
 12 Q. And I think, and I can flip to the page in your  
 13 previous testimony, I think you indicated that  
 14 Mr. McCormick had done more of the research with  
 15 respect to that. Is that -- is that what you  
 16 previously testified to?  
 17 **A. I don't -- I don't know that he -- I don't know**  
 18 **that I would have referred Mr. McCormick to that**  
 19 **specific piece of the project. I probably would**  
 20 **have referred to Mr. McCormick in the aspects of**  
 21 **the accounting process. We can go back and**  
 22 **revisit that if you'd like. I mean, certainly**  
 23 **he has knowledge of the ASR wells, how they**  
 24 **operate, kind of the same thing that I do**  
 25 **but ...**

Page 946

1 Q. I'm finding a particular page of the transcript  
 2 to help me clarify this. I'll find that later.  
 3 Did you -- would you also agree that  
 4 Mr. McCormick is the expert that would be  
 5 qualified to talk about the accounting approach  
 6 here?  
 7 **A. Sure, he's -- he's done the ASR accounting**  
 8 **report for the last multiple years so ...**  
 9 Q. And I think you also indicated that as far as  
 10 knowledge on the accounting that that was his  
 11 expertise and not yours; is that right?  
 12 **A. I -- I have assisted with development with, say,**  
 13 **the pumping files and some of the river files**  
 14 **associated with the groundwater modeling that**  
 15 **goes into the accounting report, but certainly**  
 16 **Paul is the main author of the accounting**  
 17 **report, so he would probably be best, if you had**  
 18 **specific details about how accounting was done,**  
 19 **he'd probably be best to answer that.**  
 20 Q. So do you have an opinion, then, on why the 1998  
 21 levels were used to determine that -- that 30  
 22 MGD of physical ASR recharge capacity existed,  
 23 could you explain to me the interrelation  
 24 between those concepts?  
 25 **A. I think we looked at original design capacity.**

1 This is -- I don't think we did a report or  
 2 anything, I think this was sitting down and  
 3 looking at original design capacity. If you  
 4 recall, Phase II was originally designed as not  
 5 a year-to-year resource but almost a daily  
 6 resource where peak demands were going to come  
 7 from ASR credits. So not drought purpose, while  
 8 drought was one of the purposes, but almost on a  
 9 daily source of supply. So cycling of water  
 10 levels down to that level was originally  
 11 envisioned by at least part of the engineering  
 12 design. Do I think 1998 levels are reasonable  
 13 for sustained recharge of roughly 30 MGD when  
 14 the intermittent periods of the river allow?  
 15 Sure.  
 16 Q. The concept of aquifer maintenance credits, do  
 17 you know who actually developed or came up with  
 18 that concept?  
 19 A. I -- I don't off the top of my head.  
 20 Q. Now, correct me if I'm wrong, but I think that  
 21 there was an informational meeting, and there's  
 22 a video of this on the Division of Water  
 23 Resources' website if you needed to refresh your  
 24 memory, but I think there was an informational  
 25 meeting with respect to aquifer maintenance

1 yourself?  
 2 A. No, unfortunately, I can't claim the idea for  
 3 conjunctive use or conjunctive water rights  
 4 management, no.  
 5 Q. Do you have much knowledge of Phase I and Phase  
 6 II of the City's proposals? Or in the past,  
 7 Phase I and Phase II of the City's water use?  
 8 A. Phase I water use?  
 9 Q. I'm sorry, with respect to artificial recharge,  
 10 Phase I and Phase II, are you an expert on what  
 11 historically happened with respect to Phase I  
 12 and Phase II and the ins and outs of that aspect  
 13 of the recharge?  
 14 A. You're going to have to give me more specifics  
 15 'cause Phase I and Phase II are big projects so  
 16 there's different pieces that I may or may not  
 17 be familiar with.  
 18 Q. Well, I'm just asking in general, are you aware  
 19 of any aspects of Phase I or Phase II, and is  
 20 that something that you're qualified to testify  
 21 to?  
 22 A. I'm very familiar with the -- both ASR Phase I  
 23 and ASR Phase II. In general, I'm familiar with  
 24 a good portion of the water rights permits of  
 25 Phase I and Phase II, some of the permit

1 credits, and you said, quote, that you were the  
 2 brains behind the technical components, end  
 3 quote.  
 4 A. Yeah, you bet. So I said that in an effort to  
 5 make sure we had an adequate public engagement  
 6 and that folks knew I was the one that was going  
 7 to be able to speak to things like what does a  
 8 model do, what is it made out of, things of that  
 9 nature.  
 10 And relative to AMCs, I mean, AMCs are not  
 11 that different from conjunctive use. I mean, I  
 12 don't know where the original genesis of the  
 13 idea came up for, hey, we have an opportunity to  
 14 take this to town, other than that's what the  
 15 City's been forced to do recently because we  
 16 don't have the physical recharge capacity. But,  
 17 I mean, it's not outside the ideas of other  
 18 western water states that do things like  
 19 conjunctive use, what is the opportunity to make  
 20 sure we use a transient resource to the best of  
 21 our availability? Conjunctive use.  
 22 Q. So when you said you were the brains behind the  
 23 technical components of the City's proposal,  
 24 that wasn't an indication that you had actually  
 25 developed the aquifer maintenance credit concept

1 limitations, certainly how ASR works from  
 2 coordinating with the City on operations, so  
 3 where water goes, where it can't go, pipeline  
 4 constriction, things of that nature. Hopefully,  
 5 that clears up what I, you know, have experience  
 6 with and not with.  
 7 Q. I'll ask you a specific question then. During  
 8 ASR Phase I and Phase II and the transcripts  
 9 that developed out of ASR Phase I and Phase II  
 10 and the permit conditions, there was the concept  
 11 of passive recharge credits that was identified,  
 12 is that -- is that true, do you -- does that  
 13 terminology ring a bell?  
 14 A. Sure.  
 15 Q. And can you explain for the record what a  
 16 passive recharge credit is?  
 17 A. While there is not a definition, I believe at  
 18 the time the passive recharge credit was  
 19 referring to use of Cheney in lieu of, and that  
 20 is one term that is commonly used  
 21 interchangeably, basically, with conjunctive  
 22 use, so use of Cheney in lieu of Equus Beds  
 23 groundwater, I think that was the term that was  
 24 dubbed at the time.  
 25 Q. And so the concept is that if the City chooses

Page 951

1 to use water out of Cheney versus the Equus Beds  
 2 well field, they shouldn't necessarily get  
 3 credit for that, for that decision to use Cheney  
 4 versus the Equus Beds well field. Is that the  
 5 concept of a passive recharge credit?  
 6 **A. I think that was the determination and**  
 7 **discussion at the time. Again, I wasn't part of**  
 8 **those hearings, I wasn't present for the**  
 9 **permitting and that sort of thing, but reading,**  
 10 **that's my understanding in discussions with**  
 11 **others so ...**  
 12 Q. So if the City were to choose to withdraw water  
 13 from the Little Ark River versus the well field  
 14 and they asked for a credit for that, would that  
 15 also be a passive recharge credit?  
 16 **A. I don't think so. We have the unique**  
 17 **opportunity, what sets this project apart from**  
 18 **so many other conjunctive use type projects is**  
 19 **that there is a physical link now between the**  
 20 **aquifer and the Little Arkansas River. The City**  
 21 **has the capacity during elevated ground -- or**  
 22 **during elevated river flows to take that water**  
 23 **and put it into the aquifer, that is a physical**  
 24 **link between the two systems. So for that**  
 25 **reason, I don't believe it's identical to, let's**

Page 952

1 **say, an offset from Cheney use.**  
 2 Q. But if the City were to take water, let's say,  
 3 from El Dorado Reservoir instead of the well  
 4 field and ask for credit for that, would that be  
 5 considered a passive recharge credit?  
 6 **A. Under the definition that I just believe I**  
 7 **supplied, I think that would qualify as passive**  
 8 **or conjunctive use or in lieu of.**  
 9 Q. If the City were to choose to take water from  
 10 the E&S well field and the Bentley well field  
 11 versus from the aquifer and they asked for  
 12 credit from that, would that be considered a  
 13 passive recharge credit?  
 14 **A. Well, with the exception of Bentley, which is**  
 15 **also somewhat interrelated to the basin, local**  
 16 **well field is not obviously hydraulically tied,**  
 17 **it's downstream, so under that same concept, it**  
 18 **would be in lieu of because effectively the**  
 19 **local well field is very much supported by**  
 20 **surface water flows so ...**  
 21 Q. So focusing in specifically to the Little  
 22 Arkansas River, your rationale for why taking  
 23 water from the Little Arkansas River instead of  
 24 from the Equus Beds well field, why that's not  
 25 considered a passive recharge credit in that

Page 953

1 scenario is because there's such a significant  
 2 hydrological connection between the Little  
 3 Arkansas River and -- and the aquifer, is that  
 4 what your answer is?  
 5 **A. Not just hydrologic, physical. In this case, we**  
 6 **have infrastructure that relates the two, an**  
 7 **artificial infrastructure.**  
 8 Q. And tell me -- tell me how that physical  
 9 infrastructure influences your answer.  
 10 **A. Well, you have a link between the groundwater**  
 11 **levels and a surface water resource that is**  
 12 **artificially defined. So in this instance, if**  
 13 **we don't take water out of the system, that is**  
 14 **one way to ensure that the system achieves a**  
 15 **groundwater level rise.**  
 16 The other side of that is that we have  
 17 physical recharge capacity from the Little  
 18 Arkansas River that we can physically inject.  
 19 At the point where we can't physically inject it  
 20 based on our own water resources management  
 21 decisions, the City is the one who has  
 22 proverbially shot themselves in the foot  
 23 basically by keeping water levels full. That is  
 24 an excellent outcome. So from a physical  
 25 recharge standpoint, the reason we can't

Page 954

1 physically recharge is literally because the  
 2 City has made excellent management decisions.  
 3 So that's why it is different than conjunctive  
 4 use or in lieu of water in my opinion.  
 5 Q. So if there's a gallon of water and the Little  
 6 Arkansas River is flooding and we take a gallon  
 7 of water and we divert it to the City and a  
 8 aquifer maintenance credit is accumulated for  
 9 those gallons of water sent to the City, I guess  
 10 my question is would that water have otherwise  
 11 entered the aquifer?  
 12 **A. Probably not. So we see base flow mostly**  
 13 **discharging into the Little Arkansas River. In**  
 14 **other words, during full conditions of, let's --**  
 15 **let's say, the Little Ark River, temporarily we**  
 16 **have some bank storage, temporarily we see a**  
 17 **push of that water recharging into the Equus**  
 18 **Beds Aquifer. But when things go back the other**  
 19 **direction, obviously we're not under flood**  
 20 **conditions, we hope, all the time, when the**  
 21 **river goes back down, we see base flow go back**  
 22 **to the river.**  
 23 And under normal conditions, the Little  
 24 Arkansas River is receiving water from the Equus  
 25 Beds Aquifer so it gains. In other words, the

1 **groundwater from the Equus Beds is discharging**  
2 **into the Little Ark, not the other way around,**  
3 **for the majority of the time.**

4 Q. So if that is true that that gallon of water  
5 wouldn't otherwise go into the Equus Beds well  
6 field, the gallon of water that's sent directly  
7 to the City, if that's true, then why would that  
8 not be considered a passive recharge credit?

9 **A. In this instance, we have the unique ability to,**  
10 **again, use both the base water rights and the**  
11 **physical link between the system facilitates**  
12 **conjunctive use, not with another outside body,**  
13 **not with another outside reservoir, but we have**  
14 **a physical link between the two systems, that's**  
15 **what makes it different.**

16 **So pumping from, in this instance, a base**  
17 **water right and/or leaving that water in the**  
18 **ground from not pumping your base water rights**  
19 **and meeting the demand with water you take from**  
20 **the Little Arkansas River into town is different**  
21 **than simply using that water in lieu of, let's**  
22 **say, Cheney, or another hypothetical the -- any**  
23 **other reservoir that would be developed, E&S**  
24 **well field, something in that nature. It is the**  
25 **physical link that in my opinion makes that**

1 **within the model.**

2 Q. So if 2011 and 2012 were replicated over the  
3 course of eight years, I guess my question is  
4 in -- if 2011 was used in year one and 2011 is  
5 also used in year seven, would I be  
6 understanding it correctly that the streamflow,  
7 at least, for year one and year seven would be  
8 the same in the model -- modeling that was  
9 performed by Burns & Mac?

10 **A. Under that hypothetical that you just described,**  
11 **yes, if you just described them as equal, they**  
12 **would be equal.**

13 Q. Well, and my question is in -- in year one and  
14 year seven, in the modeling that you performed,  
15 were they equal, the streamflow?

16 **A. Sure, it looks like based on table 2-5, the**  
17 **streamflows of 2011 were in year one, and in**  
18 **year seven the streamflows were also simulated**  
19 **as those that would have been equivalent to year**  
20 **2011.**

21 Q. And so I guess my question is this: If we're in  
22 a drought and each year of the drought becomes  
23 more severe, my question is wouldn't streamflows  
24 be lower potentially in year seven of a drought  
25 than they would be in year one of a drought?

1 **different than what would typically be**  
2 **considered conjunctive use or passive recharge**  
3 **credits or in lieu of water.**

4 Q. I'll just move on. How does the model account  
5 for streamflow changes?

6 **A. The model has elevations that are set based on**  
7 **interpolations between stream gages. So in**  
8 **other words, the fall and the level, the**  
9 **elevation of the river is set in between**  
10 **streamflow gages. That is documented within**  
11 **USGS groundwater model report.**

12 Q. Does -- do the streamflows change during the  
13 different years of the drought?

14 **A. Yes.**

15 Q. And how so?

16 **A. Basically, during 2011, we had the interpolated**  
17 **stream -- or interpolated river elevations**  
18 **within the model for 2011 for the Arkansas**  
19 **River, for, I believe, the Little Arkansas, and**  
20 **I'm not sure if there's another one in there but**  
21 **I know those two are for sure. And then let's**  
22 **say for the other year that's simulated within**  
23 **the model, 2012, same thing, the interpolated**  
24 **flows that are observed -- actual observations**  
25 **from streamflow are interpolated and represented**

1 **A. They could, it's possible.**

2 Q. And so why -- did the City consider taking that  
3 into account or did Burns & Mac consider taking  
4 that into account in the modeling it performed?

5 **A. We did insofar that 2011 and 2012, if you look**  
6 **at the characteristics of flow, they are both**  
7 **very, very low flows. So they are drought**  
8 **flows, if you will. So they do represent**  
9 **extremely low flow conditions.**

10 Q. But just to paraphrase here, in year seven, the  
11 streamflow was the same in year seven as it was  
12 in year one in your modeling. My question is  
13 did you ever consider variable streamflows, in  
14 other words, the streamflow slowly decreases  
15 over the course of that eight years, did you  
16 consider ever modeling that?

17 **A. You could approach it that way. In this**  
18 **instance where we've kept all the other**  
19 **hydrologic variables the same, repeating 2011,**  
20 **2012, to go outside of that we would need**  
21 **additional justification. Again, our research**  
22 **and our look at what do we want to simulate in**  
23 **terms of river values was based on 2011 and**  
24 **2012, not just because it was a nice fit, okay,**  
25 **it's the same hydrologic year, but during the**

Page 959

1 drought -- even during the 1930s drought, we had  
 2 periods that were wetter than others, and so  
 3 some years things may have come back. So  
 4 sustained values at low, in this case 2011 and  
 5 2012, is still drought representative.  
 6 I would be worried if we were on the other  
 7 end of things and let's say we found a more  
 8 moderate drought year to repeat and we repeated  
 9 that sequentially and we didn't have enough  
 10 dryness in there. But from a planning  
 11 standpoint, 2011 and 2012, certainly very low  
 12 flow years for the majority of the period, that  
 13 represents drought.  
 14 Q. If it was an actual drought and we're in year  
 15 five or six, let's say, of the drought and the  
 16 rivers actually just dry up during five or six  
 17 of the drought, and I know the Little Arkansas  
 18 River did dry up, I think, in some past years,  
 19 so if the river were to actually dry up in,  
 20 let's say, years five or six, how would that  
 21 impact or skew the modeled results?  
 22 **A. If -- if the river were effectively zero flow**  
 23 **and -- let me think about this for a second. If**  
 24 **the river flows were effectively zero, we**  
 25 **basically would not have that inflow into the**

Page 960

1 aquifer, so the water levels would be lower than  
 2 what is currently envisioned under that  
 3 scenario. So wetter conditions/higher levels,  
 4 drier conditions/lower levels with respect to  
 5 river flows.  
 6 Q. So in other words, if one were to model -- if we  
 7 were to assume that river flow was lower, even  
 8 lower than what was modeled in years five and  
 9 six, let's say it was at zero flow, in other  
 10 words, would it be true that the impact to the  
 11 aquifer would be greater if we were to model for  
 12 lower river flows --  
 13 **A. Yeah.**  
 14 Q. -- in the modeling?  
 15 **A. Sure.**  
 16 Q. Have you had occasion to read -- or you were in  
 17 the room, I believe, when Dr. Akhbari testified;  
 18 is that -- is that true?  
 19 **A. I was present, yeah.**  
 20 Q. Okay. And did you have occasion also to read  
 21 his expert report?  
 22 **A. Some of it, yeah, sure.**  
 23 Q. With regard to his expert report and his  
 24 testimony, do you agree with his statement that  
 25 the model tends to underestimate groundwater

Page 961

1 elevations?  
 2 **A. I don't know that I would agree or disagree. I**  
 3 **would have to do my own analysis on that to**  
 4 **agree or disagree. In general, I believe his**  
 5 **testimony indicated that the model accurately**  
 6 **represented or covered water level changes. His**  
 7 **finding was that it net underreported; I don't**  
 8 **remember what the quantities and values were.**  
 9 **That's my recollection of his testimony.**  
 10 Q. So as far as the statement that the model tends  
 11 to underestimate groundwater elevations, you  
 12 haven't specifically studied that, and you're  
 13 not prepared to be asked a series of questions  
 14 regarding that; is that true?  
 15 **A. No, not -- I mean, I haven't -- I could review**  
 16 **his work, but I haven't reviewed it in detail**  
 17 **enough to ...**  
 18 **And I might ask for a quick break, if**  
 19 **that's okay, just for bathroom breaks for**  
 20 **everybody.**  
 21 **PRESIDING OFFICER:** Well, it is 10  
 22 after 12:00, so if this is a good time --  
 23 **MR. STUCKY:** Sure.  
 24 **PRESIDING OFFICER:** -- I'm totally  
 25 inclined to call a lunch break. So it's 10

Page 962

1 after 12:00, let's reconvene at 1:00.  
 2 Thank you.  
 3 (Thereupon, a lunch recess was  
 4 taken; whereupon the following was  
 5 had.)  
 6 **PRESIDING OFFICER:** Okay. We're now  
 7 back on record, it's 1:05. And I neglected  
 8 to say in my introductory comments that I'm  
 9 serving as the presiding officer, my name  
 10 is Constance C. Owen, and these proceedings  
 11 are taking place at the First Mennonite  
 12 Church of Halstead in Halstead, Kansas.  
 13 Having added that in, Mr. Stucky, you  
 14 may continue.  
 15 **BY MR. STUCKY:**  
 16 Q. Mr. Clement, could you turn to table 2-10 on  
 17 page 2-24 of the City's proposal?  
 18 **A. Okay.**  
 19 Q. With respect to IW01C, the very first index well  
 20 number shown on that table, the contingency  
 21 that -- the correct contingency, I believe, was  
 22 23 feet based on the testimony from -- from  
 23 previous; is that right?  
 24 **A. Looks like 23.42, I believe, yeah, 23.**  
 25 Q. Now, could you explain to me the scientific

1 basis for a contingency?  
2 **A. Sure. In engineering, in this case modeling,**  
3 **contingency is there to represent things that**  
4 **you may or may not know about or the precision**  
5 **of the math that you're using relative to the**  
6 **variables that you have in hand. So it is**  
7 **there, I believe we characterized it as a safety**  
8 **net to things that we may or may not have**  
9 **thought about, to things that are variables that**  
10 **would be out of our control or relative to the**  
11 **precision of those variables, that is what**  
12 **contingency is.**

13 Q. Now, on the second one, on the second well shown  
14 here, I think the correct contingency there was  
15 something like 20.52; is that right?

16 **A. That seems to be correct.**

17 Q. Now, if you would, could you flip to attachment  
18 I in the City's proposal? Okay. Are you on  
19 attachment I?

20 **A. Sure, yes.**

21 Q. Okay. And in attachment I, and I just -- just  
22 for lack of a better way to do this, I don't see  
23 a page number or anything, I'm going to hold up  
24 my notebook, and it shows the start of some  
25 hydrographs, and then prior to the start of

1 those hydrographs, there is a table that's  
2 shown.

3 **A. Yeah. Okay.**

4 Q. Are you on that particular page now?

5 **A. Sure.**

6 Q. On attachment I, what we show in this table is  
7 the -- for that same well that we just -- and  
8 keep your finger, and I should have said this to  
9 you, I kept my phone there, on table 2-10, for  
10 that very first well, IW01C, we also see that  
11 it's also shown or depicted in this table, is  
12 that right, that same well?

13 **A. Say that one more time.**

14 Q. The very first well that's shown in table 2-10,  
15 that's also depicted in this table that I --  
16 that I pulled you to in attachment I; is that  
17 correct?

18 **A. The index site is represented. I will note for**  
19 **the record that it looks like on table 2-10 IW1C**  
20 **is represented because we are talking about the**  
21 **lower index levels, which the current index**  
22 **levels are based on the lower aquifer elevation.**  
23 **And the table that we were just discussing as**  
24 **part of attachment I, this table is referenced**  
25 **to saturated thickness, so that entire interval**

1 **is saturated is basically what we're saying, so**  
2 **we're not representing a pressure at that**  
3 **location, we are representing a saturated**  
4 **thickness. So just as a note, they are**  
5 **effectively nearly the same throughout most of**  
6 **the well field; there are small differences**  
7 **between the upper and lower.**

8 **But that is what these two tables are**  
9 **representing, one is the sea level, or lower**  
10 **level aquifer; the other one is the upper. And**  
11 **then the attachment I table I'm looking at**  
12 **represents, it looks like, saturated thickness.**  
13 **They are near the same location, usually feet**  
14 **apart, if I recall the location of those index**  
15 **wells.**

16 Q. So table 2-10 is showing the relevant  
17 contingencies, and this table in attachment I,  
18 what this shows to us is the change in the  
19 saturated thickness over the course of the  
20 modeling; is that right?

21 **A. That is correct.**

22 Q. Okay. So just as far as the correlation, IW01A,  
23 would that be the same monitoring site or the  
24 same index well site as what's shown as IW01C in  
25 table 2-10?

1 **A. They are effectively the same site, they --**  
2 **again, there is a lower monitoring well and a**  
3 **upper monitoring well.**

4 Q. Uh-huh.

5 **A. They are generally within feet of one another,**  
6 **they are very close.**

7 Q. So with respect to IW01A, if we look at the  
8 initial condition of the aquifer when we start  
9 in IW01A, would we agree that the saturated  
10 thickness of the aquifer shown there is  
11 84 percent in the initial condition?

12 **A. Yes.**

13 Q. And would you also agree that in year eight, the  
14 saturated thickness is then 79 percent in -- in  
15 year eight; is that true?

16 **A. In the table that is what it says, yes.**

17 Q. And so the difference between 84 percent and  
18 79 percent, that would be a 5 percent  
19 difference; is that right? If we just strictly  
20 subtracted 80 -- 79 from 84, that would be 5; is  
21 that right?

22 **A. Sure.**

23 Q. Now, in table 2-10, if we flip back to table  
24 2-10, and we keep our finger also on the spot in  
25 attachment I, if you were to look at well

Page 967

1 number 2, index well number 2, we decided that  
 2 the contingency that was added there was  
 3 20.52 feet. And if we go back to attachment I,  
 4 to that table, would you agree with me that we  
 5 could match up that same index well site to  
 6 what's depicted as IW02A on this attachment I?  
 7 **A. Sure.**  
 8 Q. And in IW02A, it says the initial aquifer  
 9 condition is at 88 percent, and then at the end  
 10 of the eight years of modeling, it's at 85  
 11 percent; is that right?  
 12 **A. That is correct.**  
 13 Q. And so if we were just numerically to subtract  
 14 those two numbers, the difference between 85  
 15 percent and 88 percent, if we just subtracted  
 16 those two numbers, we wind up with 3 percent; is  
 17 that right?  
 18 **A. That is correct.**  
 19 Q. So I guess my question is, then, if -- if that's  
 20 true, why do we need a 23-foot contingency with  
 21 respect to index cell 1 and a 20-foot  
 22 contingency with respect to index cell number 2,  
 23 if actually the reduction in the saturated  
 24 thickness is much less?  
 25 **A. So I believe those two wells are located up in**

Page 968

1 **the Sand Hills, and during discussions with the**  
 2 **person who was modeling, we looked at how water**  
 3 **level fluctuations occur in that particular**  
 4 **area. We do see some larger swings. Again, I**  
 5 **don't believe there is ASR infrastructure, but**  
 6 **if we wanted to both physically inject or**  
 7 **recover, we added those large swings in terms of**  
 8 **contingency. So that was the purpose of the**  
 9 **larger contingency relative to the rest of the**  
 10 **model, or the rest of the results.**  
 11 Q. Do you know what the average drop was in the  
 12 aquifer levels for the entire basin during the  
 13 eight years of modeling from -- from the very  
 14 beginning to the end of the eight years of  
 15 modeling?  
 16 **A. I believe that was provided as a statistic, I**  
 17 **can see if I can find that in the report for**  
 18 **you.**  
 19 Q. Okay.  
 20 **A. It looks like based on table 2-9, we had an**  
 21 **average water level drop of roughly 8.2 feet**  
 22 **across the entire basin storage area as a**  
 23 **geographic average.**  
 24 Q. That's what I also had in my notes that you had  
 25 put in the proposal. So if that is true that

Page 969

1 the average drop was 8 foot versus 10 foot,  
 2 why would we need a contingency of 10 feet  
 3 versus 20 feet versus 23 feet, why would we  
 4 need -- is the 10 -- is the entire contingency  
 5 numbers, are they too liberal, if you will?  
 6 **A. I don't think so, I think I just answered the**  
 7 **question previously so I will try and answer it**  
 8 **again. That particular area where IW1 and IW2**  
 9 **are is located in the Sand Hills region. That**  
 10 **area experiences some very high water level**  
 11 **swings relative to the rest of the basin storage**  
 12 **area, so that would mean that it would be**  
 13 **logical to apply additional contingency to those**  
 14 **areas. If you see water level fluctuations that**  
 15 **are greater than the rest of the basin storage**  
 16 **area relative to the same stress, it's logical**  
 17 **to apply additional contingency to those areas.**  
 18 **That is the source of the additional**  
 19 **contingency.**  
 20 Q. You indicated that after -- after eight years of  
 21 drought, at least with respect to index well 1,  
 22 the predevelopment aquifer thickness remaining  
 23 goes down by about 5 percent. Does that -- is  
 24 that right?  
 25 **A. Relative to what area?**

Page 970

1 Q. Index well 1, from the start of the drought till  
 2 the end of the drought?  
 3 **A. I believe that was accurate.**  
 4 Q. But your proposed level in your -- in the -- in  
 5 your proposal, doesn't that result in an aquifer  
 6 thickness that is 12 percent lower than what, in  
 7 fact, the modeling shows?  
 8 **A. Well, yeah, we're talking about two different**  
 9 **things. We're talking about ending conditions**  
 10 **based on the model and then proposed conditions,**  
 11 **those are two different things. So, remember,**  
 12 **we just talked about contingency was added to**  
 13 **the end of the models so those would be**  
 14 **different.**  
 15 Q. And so I guess my question is, then, if we look  
 16 at the difference between this contingency  
 17 added, without the contingency added, why -- why  
 18 do we have to have such a vast difference? In  
 19 other words, you know, a vast difference in the  
 20 saturated thickness or the difference in the  
 21 saturated thickness with this contingency added?  
 22 **A. So I'm going to go for this one more time. The**  
 23 **area of the Sand Hills that comprises the index**  
 24 **cells for, I believe, 1 and 2 lies within the**  
 25 **Sand Hills region. That area up there is maybe**

1 possibly defined as semi-confined, and there are  
2 also portions out there in the Sand Hills where  
3 you have perched water table. It is a complex  
4 environment, and we see, from my knowledge of  
5 that area, water level changes that are in  
6 greater magnitude relative to the same amount of  
7 the stress within the basin storage area. So,  
8 therefore, the contingency on how water levels  
9 change with respect to the possible error in the  
10 outcome of the results should be higher. That  
11 is just math.  
12 Q. So to make sure I understand this right, with  
13 index cell 1, we start with the 5 percent that's  
14 shown in that attachment I. I believe with  
15 index cell 1 you're adding a 12 percent  
16 contingency, and so that makes a total drop of  
17 17 percent, is that right, if I'm adding those  
18 numbers correctly?  
19 **A. I don't -- I don't think I followed. Try that**  
20 **one more time.**  
21 Q. What was shown in attachment I shows a 5 percent  
22 change --  
23 **A. Uh-huh.**  
24 Q. -- over the course of year zero to year eight.  
25 If you were to add a 12 percent contingency,

1 Again, relative to the importance of the  
2 hearing and the process, we don't currently have  
3 infrastructure, I don't believe, in those two  
4 cells. However, as we were going forward and  
5 putting forward appropriate bottoms for the  
6 project, we wanted to account for those large --  
7 larger water level swings in that area as a  
8 potential bottom. So that would be the reason  
9 for the additional contingency.  
10 To the numbers that you named off,  
11 percentages, specific percentages and the  
12 specific math, I may not be able to answer that  
13 today, but I can tell you the genesis clearly of  
14 those two numbers best I can to my knowledge.  
15 Q. Well, at least with respect to index well 1,  
16 would it be a true statement that the  
17 contingency is over double that of the modeled  
18 results with respect to the change in saturated  
19 thickness, would that be a true statement?  
20 **A. The contingency is double that of the typical**  
21 **contingency that is used throughout the rest of**  
22 **the model area, again for the same purpose that**  
23 **we see greater water level swings in that area**  
24 **in magnitude than we do in other places. It's**  
25 **not relevant to saturated thickness; it's simply**

1 which is what I think you're proposing to add,  
2 doesn't that drop it by 17 percent, the  
3 saturated thickness?  
4 **A. I'm afraid I'm not following on that. I think**  
5 **we're still talking apples and oranges here. I**  
6 **mean, what -- what the table in attachment I is**  
7 **showing is what is the result of the model. And**  
8 **those individual stress period years, those**  
9 **percentage values, I believe, are representative**  
10 **of what the index cell makes up in terms of**  
11 **whether the average saturated thickness of the**  
12 **geographic area of that index cell, and so that**  
13 **is the end -- let's say, stress period eight,**  
14 **that is essentially the end of the model run.**  
15 **And since we are not perfect people, I**  
16 **would love to think that I am a good modeler and**  
17 **take good science into account, even with all**  
18 **those elements, there is still an element of**  
19 **contingency, that's normal practice in**  
20 **engineering. So we wanted to add the**  
21 **appropriate amount of contingency relative to**  
22 **the water level changes that we see in that**  
23 **area, and we see greater magnitude in water**  
24 **level changes in that area than we do in other**  
25 **places of the aquifer.**

1 a function of the model results.  
2 So if we take the model results, in this  
3 case, they did not -- I'm looking at IW1 and  
4 IW2, it looks like IW2 dropped just slightly  
5 below the 1993 levels. And so our basis of  
6 saying what was an appropriate level for those  
7 two cells was slightly different than the rest  
8 of the basin storage area simply because we saw  
9 those larger water level swings in those areas.  
10 Q. So you don't -- you're not agreeing that the  
11 added contingency result in an extra 12 percent  
12 reduction in the saturated thickness for well 1?  
13 **A. I don't have the information in front of me to**  
14 **make sure that we're talking apples to apples,**  
15 **so I wouldn't be able to answer that question**  
16 **directly without making sure that I had the**  
17 **exact math right, you know, through explanation.**  
18 Q. Okay. I'll move on. Were you involved in  
19 determining the 120,000 foot -- or acre-foot cap  
20 that was included in the City's proposal, was  
21 that part of your brainchild for the City's  
22 proposal, or were you involved in coming up with  
23 that number?  
24 **A. Sure, I was involved in the proposal, yeah.**  
25 Q. Can you explain what the rationale was for

Page 975

1 choosing 120,000 acre-foot as far as the cap?  
 2 **A. Sure, and I believe others have talked --**  
 3 **touched on it as well. When the project, Phase**  
 4 **I, Phase II was envisioned, the delta between**  
 5 **the lowest levels generally that occurred within**  
 6 **the basin storage area, those levels were**  
 7 **observed during 1993. The delta between a full**  
 8 **condition, in other words predevelopment, and**  
 9 **that 1993 condition essentially adds the top,**  
 10 **you can't fill it any more than full.**  
 11 **In 1993 when the project was envisioned --**  
 12 **or at least the lower aquifer levels were**  
 13 **envisioned, that would represent a reasonable**  
 14 **low in terms of the available storage when the**  
 15 **project was envisioned, and so -- and then the**  
 16 **sides are certainly just the basin storage area.**  
 17 **So the genesis of that was taking the USGS**  
 18 **interpolated values for 1993, that specific**  
 19 **raster in their estimate of 120,000 acre-feet of**  
 20 **storage relative to predevelopment conditions,**  
 21 **that's where the 120,000 came up from.**  
 22 **Q. But if you flip to page 2-10 of the City's**  
 23 **proposal, which is included as table 2-5.**  
 24 **A. You said page 2-10 of the proposal?**  
 25 **Q. Yeah, 2-10 of the -- page 2-10 --**

Page 976

1 **A. Okay.**  
 2 **Q. -- table 2-5.**  
 3 **A. Okay.**  
 4 **Q. I believe that Mr. Pajor testified that during**  
 5 **this -- this model stress period of those eight**  
 6 **years, the City's use out of -- with respect to**  
 7 **pumping from ASR credits would be right around**  
 8 **50,000. Is that -- do you recall that**  
 9 **testimony?**  
 10 **A. Yeah, and I would -- I mean, if you wanted to**  
 11 **look at what the total demand was there, you**  
 12 **could add up those rows. I believe it's 58,000,**  
 13 **something on that order, but -- if I had a**  
 14 **calculator, I could do it, but, yeah, I mean,**  
 15 **50,000 versus 120,000, this is what we say we**  
 16 **think we need in year 2060 is that 50 to 60,000**  
 17 **number.**  
 18 **Q. Okay. So is your testimony today that the cap**  
 19 **should be closer to 50 or 60,000, is that your**  
 20 **testimony today, versus a cap of 120,000?**  
 21 **A. No. I don't see how accumulating more credits**  
 22 **would be necessarily a bad thing in excess of**  
 23 **the 60,000. Again, as much as we like to think**  
 24 **that we're perfect scientists and have**  
 25 **everything right, you know, 60,000, what if it's**

Page 977

1 **65,000? What if we set the cap at 60,000 when**  
 2 **all of a sudden we need in 2060 65,000, where is**  
 3 **that additional water going to come from, how**  
 4 **are we going to create that additional supply**  
 5 **for the City?**  
 6 **There is no cap that I know of now on the**  
 7 **amount of physical recharge credits. In early**  
 8 **discussions with the City, with the AMC concept**  
 9 **and both the physical recharge concept, there's**  
 10 **not currently a cap, but the proposal, we felt**  
 11 **like, might be beneficial with an included cap;**  
 12 **and that way there was an assurance that at some**  
 13 **point there is a cap to the total amount of AMCs**  
 14 **or physical recharge credits that could be**  
 15 **approved. Just so it wouldn't be infinite.**  
 16 **Q. Well, at least based on the modeled results,**  
 17 **would you agree that as far as what the City's**  
 18 **need is during an eight-year drought, just based**  
 19 **on your modeled results, would you agree that a**  
 20 **cap closer to 60,000 would be more consistent or**  
 21 **accurate based on the results that were modeled?**  
 22 **A. I don't know that it would be consistent or**  
 23 **accurate. Again, no one is perfect in their**  
 24 **predictions, we cannot predict the future.**  
 25 **Again, if we make the cap 60,000 acre-feet and**

Page 978

1 **we need 65,000 acre-feet, all of a sudden we're**  
 2 **back in another hearing process.**  
 3 **I think what would be more appropriate is**  
 4 **right now we don't have a cap. The City is**  
 5 **proposing an additional restriction, and I think**  
 6 **the 120,000 is -- is more than representative**  
 7 **and comes from an actual physical number that's**  
 8 **well established by an independent party, by**  
 9 **USGS, not by the City, not by a regulatory**  
 10 **agency, by the people that literally do**  
 11 **hydrogeologic and geologic investigations.**  
 12 **Q. A amount ago you said, I don't see the harm if**  
 13 **we have a cap at 120,000 acre-feet. If we raise**  
 14 **the cap from, let's say, 60,000 acre-feet to**  
 15 **120,000 acre-feet, do you follow me --**  
 16 **A. Uh-huh.**  
 17 **Q. -- for a moment?**  
 18 **A. Sure.**  
 19 **Q. If we raise that cap from 60,000 acre-feet to**  
 20 **120,000 acre-feet, who is that good for? Is**  
 21 **that good for the City, or is it good for the**  
 22 **health of the aquifer, which one?**  
 23 **A. Well, if, let's say, we actually accumulated**  
 24 **120,000 acre-feet, I mean, that is a huge**  
 25 **success for everyone, the City, the aquifer, the**

1 users of the aquifer, everyone, in my -- in my  
2 opinion. At that point, if we actually could  
3 accumulate 120,000 acre-feet of credits, the  
4 aquifer ought to be pretty darn full at that  
5 point. That is a win for everyone.

6 At the point where, let's say, we accrued  
7 120,000 acre-feet and in this instance say,  
8 well, we really only think we need 60,000  
9 acre-feet, the net impact of maintaining the  
10 aquifer full and only happen to use  
11 60,000 acre-feet is still the same, it's kind of  
12 moot at that point.

13 Q. What about at the time, let's say, when the  
14 120,000 acre-feet of credits versus the  
15 60,000 acre-feet in credits are removed or  
16 utilized and that water is taken from the  
17 aquifer, is it -- is it better at that point  
18 that the City has a 60,000 acre-foot cap or  
19 120,000 acre-foot cap? In other words, at the  
20 time when it's withdrawn, which is going to  
21 impact the aquifer more?

22 A. If you're asking me which would impact the  
23 aquifer more, pumping 60,000 acre-feet or  
24 120,000 acre-feet, the answer would be clear  
25 it'd be 120,000 acre-feet, with the caveat that

1 Q. So if we were to limit this cap to the  
2 infrastructure, for a logical connection between  
3 the cap and the infrastructure the City already  
4 has in place, do you know what that cap would  
5 be?

6 A. I don't. I mean, I know from a permitting  
7 standpoint right now, I believe the maximum  
8 number of credits that can be recovered in a  
9 given year is roughly 19,500. I don't know off  
10 the top of my head with all wells running 24/7,  
11 365 what that would look like. I don't think  
12 that's a anticipated, you know, event. That --  
13 that wouldn't occur all the time anyway just in  
14 normal demand practice but ...

15 Q. With your testimony today, are you suggesting  
16 that the City has the right to claim the aquifer  
17 storage space from 1993 to predevelopment  
18 levels?

19 A. No, I'm not, and that's -- that's more of a  
20 legal question. I just answered the question as  
21 the basis of the genesis for the -- the  
22 120,000 acre-feet cap, which is the 1993 levels,  
23 which were the lowest level, and then  
24 predevelopment conditions, which would be the  
25 fullest that the aquifer could ever get. That

1 I don't know that the City could pump 120,000  
2 acre-feet with their existing infrastructure if  
3 they tried, with the existing well  
4 infrastructure that was in the ground during the  
5 duration of eight -- eight years of drought.

6 Q. Well, normally, in water loss, you know, when we  
7 perfect and everything of that nature, we're  
8 based on -- our perfection and our water use is  
9 limited by the infrastructure we have in place.  
10 Is that generally a true statement?

11 A. To the extent that you would have in the example  
12 rate, a pumping well that gets certified by a  
13 rate and then, for example, if you're an  
14 irrigator, you might have a center pivot and  
15 that area that you irrigate is also part of the  
16 perfection, you get a certain number of acres  
17 that you're allotted, that is generally the  
18 relationship between infrastructure and the  
19 actual perfection, if you will.

20 Same thing with municipalities, the wells  
21 are certified for a rate, what they can actually  
22 produce or whatever the record was producing  
23 generally, and then from there you work into a  
24 net total or an individual total by well as the  
25 City grows, as -- as the demands increase.

1 represents the top and the bottom, and the sides  
2 consist of what is defined as a geographic area  
3 of the basin storage area; therefore, you have a  
4 total storage vessel that, at least, when the  
5 project was envisioned represents the net  
6 available storage, potentially, for the project.

7 Q. You mentioned the infrastructure the City has in  
8 place. Based on your knowledge of that  
9 infrastructure, can the City currently pump  
10 water out of the aquifer faster than it can  
11 recharge the aquifer?

12 A. Faster than naturally occurring or artificial?

13 Q. Artificial recharge?

14 A. Can they pump it out of the ground faster than  
15 they can recharge it?

16 Q. Yes, that's the question.

17 A. Absolutely, yeah.

18 Q. Previously, I asked the question about whether  
19 or not the City could put into place the  
20 infrastructure to both pump water out of the  
21 aquifer and to recharge the aquifer at the exact  
22 same time, and the answer to that question was  
23 yes, that hypothetically that could be done.

24 Have you made any recommendations to the City in  
25 that regard?

Page 983

1 **A. We've looked at that a little bit. It kind of**  
 2 **goes to the same argument that we were looking**  
 3 **at, if you remember the operations plan, the**  
 4 **draft operations plan, basically we're at a**  
 5 **point right now where we've got 30 MGD of**  
 6 **production capacity from water treatment plant,**  
 7 **and we've got more than 30 MGD in recharge**  
 8 **capacity in the well field. The issue is water**  
 9 **levels have raised within the well field due**  
 10 **largely to the City's management practices, and**  
 11 **so we're at a point where we have recharge wells**  
 12 **at essentially idle capacity already because of**  
 13 **the City's own management practices, which --**  
 14 **which is a great story to tell. Western Kansas**  
 15 **would love to be in the shoes that we are now.**  
 16 **So relative to new infrastructure,**  
 17 **additional recharge wells that would take very**  
 18 **little water or on the scale of what we already**  
 19 **have, more straws trying to inject, I wouldn't**  
 20 **necessarily recommend that. We already have**  
 21 **straws that can inject now. Adding additional**  
 22 **idle recharge capacity is probably not going to**  
 23 **help our issue. We're talking about ways we can**  
 24 **artificially manage, again, through the AMC**  
 25 **process or through the modification of the**

Page 984

1 **bottom -- bottoms of the index levels here to**  
 2 **create a system that works basically to the**  
 3 **benefit of, we think, everybody.**  
 4 **Q. And my question was if the City could recharge**  
 5 **and withdraw at the same time and let's say we**  
 6 **can make those numbers equal, at the same rate**  
 7 **that we're injecting into the aquifer, we're**  
 8 **pulling water out of the aquifer, if there was**  
 9 **infrastructure in place to do that, do you see**  
 10 **that as a benefit is my question?**  
 11 **A. You could try to do that. I don't know that it**  
 12 **would work, let's say if we're trying to take**  
 13 **out 20,000 acre-feet and trying to inject it at**  
 14 **the same time. Theoretically, I suppose you**  
 15 **could try and do that.**  
 16 **Q. What is -- just for the record, what is**  
 17 **saturated thickness?**  
 18 **A. It is the portion of the aquifer in this**  
 19 **instance that is saturated from -- if you go out**  
 20 **and take a water level in an unconfined system,**  
 21 **which we largely have here, it is the water**  
 22 **level, the saturated portion of the, hopefully,**  
 23 **sands down to in this instance the Equus Beds is**  
 24 **underlain by bedrock, shale, and the difference**  
 25 **between that water level and the bedrock is the**

Page 985

1 **saturated thickness of the aquifer.**  
 2 **Q. What's the difference between saturated**  
 3 **thickness and practical saturated thickness?**  
 4 **A. Practical saturated thickness would be a term**  
 5 **used if you had large clay units or something**  
 6 **that did not readily contribute to aquifer**  
 7 **storage or release from aquifer storage within**  
 8 **that interval. So in other words, if we had an**  
 9 **instance 7 -- or 100 foot of sand and we fill**  
 10 **that up with water and all the pore spaces in**  
 11 **that sand are filled up and it's 100 percent**  
 12 **saturated, we'd have 100 foot of saturated**  
 13 **thickness.**  
 14 **Now, if we have clay stringers within that,**  
 15 **we would subtract those potentially and call**  
 16 **that practical saturated thickness as those**  
 17 **clays don't readily yield water for, at least,**  
 18 **production purposes and supply purposes. So**  
 19 **when we look at installing a well or other**  
 20 **infrastructure, oftentimes that is a term that**  
 21 **is used. Yeah, you've got, as an example,**  
 22 **100 foot of saturated thickness, but only 50 of**  
 23 **that, as an example, would be sand, so we would**  
 24 **call the practical aquifer saturated thickness**  
 25 **50 feet rather than 100 feet.**

Page 986

1 **Q. Okay. I think I understand. So if we had**  
 2 **100 feet of bedrock and 100 feet of that was**  
 3 **purely sand, we would say that's 100 feet of**  
 4 **practical saturated thickness; is that right?**  
 5 **A. If that full interval was saturated, yes.**  
 6 **Q. And under the same scenario, if down 50 feet we**  
 7 **have 50 feet of sand and then after 50 feet we**  
 8 **have clay, clay layers before we get to the**  
 9 **bedrock, we would say, assuming the whole**  
 10 **portion is saturated, we would assume -- we**  
 11 **would say that that practical saturated**  
 12 **thickness is only 50 feet, right?**  
 13 **A. That would be -- yes, correct.**  
 14 **Q. Now I'd ask that you turn to table 2-9 --**  
 15 **A. Okay.**  
 16 **Q. -- on page 2-16 of the City's proposal. Now,**  
 17 **just to refresh just a moment, perhaps also for**  
 18 **the audience, what does table 2-9 depict?**  
 19 **A. So table 2-9, which is located on page 2-16, 2-9**  
 20 **says groundwater modeling results for the**  
 21 **1 percent drought simulation. So the first row**  
 22 **is just saying stress periods, so in other words**  
 23 **we're stepping through time here one year at a**  
 24 **time. The next row down is statistics for the**  
 25 **basin storage area, and that second row is the**

1 average water level change from starting  
2 condition. The next row down from that is the  
3 central well field storage area water level  
4 change from starting condition, and that is  
5 showing how water levels change geographically  
6 inside those different bounded areas of the  
7 basin storage area and central well field area  
8 through time.

9 The next two are the ASR basin storage area  
10 aquifer condition percent full. Again, people  
11 think of the aquifer in different ways. Some  
12 people think of it as depth of water, some  
13 people think of it as, well, how full is the  
14 aquifer. We tried to capture that in different  
15 ways in this table. And the ASR aquifer  
16 condition percent full, that is based on that  
17 saturated thickness relative to predevelopment.  
18 So in other words, before anybody was pumping  
19 the aquifer, basically things were 100 percent  
20 full; you can't get any fuller than when there's  
21 no stress on the system.

22 So we take that level, compared to the  
23 bedrock level relative to the basin storage area  
24 and come up with those percentages on a  
25 year-by-year basis. Same thing, same approach

1 here.

2 Q. So in other words, if we back up to what you  
3 stated before, if there were clay layers and  
4 things of that nature that allowed for the  
5 practical saturated thickness to be less, that  
6 wouldn't have been taken into account in this  
7 table. Is that a true statement?

8 A. Well, it doesn't list practical saturated  
9 thickness. From the standpoint that the model  
10 represents those changes, the K-values that are  
11 within the model represent things that are --  
12 let's say if we have a higher -- the ability of  
13 water to move through sands or any system, that  
14 is basically called hydraulic conductivity. The  
15 model uses this term and adjusts up and down for  
16 each cell or each group of cells what we think  
17 the hydraulic conductivity is, in other words  
18 how sandy it is, how clay-y is it, so we can  
19 adjust how water moves within the system.

20 From that standpoint, it is in here in  
21 terms of what we think the relative changes will  
22 be. But relative to the specific saturated  
23 thickness values that are here, we don't make  
24 any reductions for, let's say, at an index site  
25 or at a given geographic area what the practical

1 for the central well field storage area.

2 Q. So let's focus on the central well -- central  
3 well field storage area in that last line. It  
4 starts out at 90 percent in year one for the  
5 saturated thickness, and then in year eight, it  
6 changes to 86 percent. Is that -- is that a  
7 true statement as far as what that table shows?

8 A. Yes.

9 Q. So my question is do you know if the data and  
10 the well log data that was utilized to generate  
11 this table 2-9, do you know as you're sitting  
12 here today whether that took into account the  
13 practical saturated thickness of those well  
14 logs?

15 A. I do. So it would not have. The genesis of  
16 those percentages is, again, we took the bedrock  
17 elevation data that was in the USGS groundwater  
18 model and then the predicted heads from the USGS  
19 groundwater model for those specific geographic  
20 areas and then compared that to an interpolated  
21 water level surface that was provided by USGS in  
22 their initial studies to say, here's what  
23 absolute full looks like, and that's how those  
24 percentages were generated. So practical  
25 saturated thickness is not included as a line

1 saturated thickness of that area might -- may or  
2 may not be.

3 Q. Okay. So you didn't go back and look at  
4 individual well locations and try and determine  
5 whether there were clay layers at those  
6 individual well locations and whether or not  
7 that would impact these -- these overall  
8 numbers?

9 A. No, practical saturated thickness is not listed  
10 here. Again, it's represented in the model  
11 based on, you know, how clay at a certain  
12 interval might be; again, it's a three-layer  
13 model. So to the extent that it affects water  
14 level changes, it's represented, but as an  
15 actual, if we were to go out and, let's say,  
16 pick a spot within the model and say, what is  
17 the practical saturated thickness at this  
18 specific location or go out and say, for this  
19 geographic area for an index cell, what's the  
20 practical saturated thickness, we did not run  
21 that exercise.

22 Q. Okay. So if we were to -- and just for clarity  
23 purpose, table 2-9, that is -- that's for the  
24 whole basin, is that right, table 2-9?

25 A. That is for the basin storage area and central

Page 991

1 well field storage area --  
 2 Q. Okay.  
 3 **A. -- both geographic locations.**  
 4 Q. If we go to figure 10 now, that's -- it should  
 5 look like this.  
 6 **A. Okay.**  
 7 Q. With respect to figure 10, what we see here now  
 8 in figure 10 is individual index cells, ASR  
 9 index cells; is that right?  
 10 **A. Yeah, in figure 10, just so we're clear, make**  
 11 **sure we're on the same page, average aquifer**  
 12 **conditions by index cell at the end of simulated**  
 13 **drought stress period eight. So this is the**  
 14 **model predicted saturated thickness relative to**  
 15 **the statistics approach that we just talked**  
 16 **about earlier for each index cell.**  
 17 Q. And so on this particular figure, not only is it  
 18 showing us a percentage of the remaining -- of  
 19 the average saturated thickness, which is shown  
 20 in blue, but it's also showing us the average  
 21 remaining saturated aquifer thickness in feet.  
 22 Is that a true statement?  
 23 **A. That would be accurate.**  
 24 Q. So in other words, for index well 1, what this  
 25 is showing me is that for that index cell, after

Page 992

1 the modeling occurs, there's 163 feet of average  
 2 remaining saturated aquifer thickness; is that  
 3 true?  
 4 **A. In that cell, yeah. I believe our approach was**  
 5 **to use as a single well may not represent the**  
 6 **entirety of an index cell. We wanted to kind of**  
 7 **average things out, if you will, represent that**  
 8 **entire square, we felt like that was more**  
 9 **representative than a spot, I believe that was**  
 10 **our approach. So we would say in IW1, there**  
 11 **would be roughly 163 foot of saturated thickness**  
 12 **approximately at the end of stress period eight,**  
 13 **and that means that it is roughly 83 percent**  
 14 **full relative to predevelopment.**  
 15 Q. And so -- and I won't do this for time sake, but  
 16 if we were to walk through each of these index  
 17 cells, the black number would show the average  
 18 remaining saturated aquifer thickness in feet,  
 19 and the blue number would show that average  
 20 aquifer condition as a percentage; is that -- is  
 21 that true?  
 22 **A. Yes.**  
 23 Q. Now, with respect to figure 10, did this figure  
 24 take into account the practical saturated  
 25 thickness of these different cells?

Page 993

1 **A. No. With the caveats we talked about earlier,**  
 2 **the model itself contains different hydraulic**  
 3 **conductivity values based on what we think the**  
 4 **lithology is. Outside of that, you don't have a**  
 5 **practical saturated thickness number listed**  
 6 **here.**  
 7 Q. With respect to each of these index cells, did  
 8 you personally evaluate any individual well  
 9 locations and what some of those saturated  
 10 thickness and practical saturated thickness  
 11 would look like?  
 12 **A. I don't -- I don't believe I did that exercise.**  
 13 **One could do that exercise, I don't believe I**  
 14 **did it as part of the report here.**  
 15 Q. There's dedicated monitoring wells in each of  
 16 the index cells. Is that a true statement?  
 17 **A. Yes.**  
 18 Q. Did you analyze the well log data for each of  
 19 those monitoring wells personally?  
 20 **A. I don't recall. I mean, I've certainly worked**  
 21 **with them or seen them over a period of time**  
 22 **working with both ASR Phase I and Phase II. I**  
 23 **don't know that I specifically reviewed the**  
 24 **intervals here. Again, I believe the numbers**  
 25 **that are being represented are averages from the**

Page 994

1 **model output, and I'm not -- I'm trying to**  
 2 **think, I think the index well sites were**  
 3 **represented as bedrock data within the USGS**  
 4 **report. I don't recall off the top of my head,**  
 5 **but that is -- that is how those numbers came**  
 6 **about.**  
 7 Q. Do you know if anyone with Burns & Mac or with  
 8 the City, whether or not they analyzed these  
 9 individual index cell monitoring wells and the  
 10 practical saturated thickness for those wells or  
 11 any specific wells?  
 12 **A. Not off the top of my head, I don't recall**  
 13 **anyone who specifically did that exercise.**  
 14 Q. Okay. As you're sitting here today, do you have  
 15 any reason why nobody would have done that?  
 16 **A. So the spirit of this was to make sure we**  
 17 **conveyed the information a couple different**  
 18 **ways. We tried to illustrate not only**  
 19 **elevations, so if an individual user -- knowing**  
 20 **that this was very likely to go to a hearing**  
 21 **process, we wanted to be very open and clear in**  
 22 **what we think it meant in terms of water level**  
 23 **elevation in terms of the predicted answer and**  
 24 **then also the proposed level.**  
 25 **If an individual user had a concern about**

1 the practical saturated thickness at a given  
2 location, then certainly the hearing process  
3 kind of presented that opportunity for us to go  
4 cell by cell or well by well over thousands and  
5 thousands of well logs to try and figure out  
6 a -- an accurate representation of practical  
7 saturated thickness. I didn't see necessarily  
8 the value in that. I mean, one could do that in  
9 theory but probably not a whole lot of value  
10 relative to this. With enough information, I  
11 think someone is informed.  
12 Q. But you would agree with me that what's shown in  
13 figure 10, those are modeled results; is that  
14 right?  
15 **A. That would be accurate, I believe, yes.**  
16 Q. And no -- and neither you nor anyone that you're  
17 aware of, at least as a part of your team,  
18 compared these modeled results to the actual  
19 well log data. Is that a true statement?  
20 **A. I don't -- I don't recall doing that personally,**  
21 **and I don't recall a colleague or the City**  
22 **during the work-up process specifically in my**  
23 **memory, no.**  
24 Q. But would you agree with me that if one were to  
25 compare the modeled results with the actual well

1 that I have 100 feet of aquifer underneath me,  
2 but a lot of that's clay, certainly there's the  
3 opportunity for that in review.  
4 **So that's why we didn't feel like it would**  
5 **be, number one, accurate to have to perhaps say,**  
6 **at a four-mile-square level, say what practical**  
7 **saturated thickness was or wasn't. But**  
8 **number two, we were just trying to convey here**  
9 **is the general statistics for someone to take on**  
10 **and digest by themselves.**  
11 Q. Okay. So that -- so in your view, part of the  
12 reason why we're having this hearing is if  
13 somebody has a concern about the practical  
14 saturated thickness in a given area that this  
15 can be testified to and addressed in this  
16 hearing; is that true?  
17 **A. Sure, I -- I would think that would be the**  
18 **purpose of a hearing is to be heard, yes.**  
19 Q. Okay. Now, if we were to move to table 2-11,  
20 and I'm not going to beat a dead horse here,  
21 but, again, with respect to table 2-11, with my  
22 same line of questions, nobody took into account  
23 individual wells or the practical saturated  
24 thickness in table 2-11 either; is that correct?  
25 **A. That's correct.**

1 data and well log data that that would actually  
2 be a comparison that could be made to help  
3 ensure that there was accuracy in these modeled  
4 results?  
5 **A. Well, the modeled results are accurate in terms**  
6 **of what they predict in terms of water level**  
7 **change, so the ending elevation of the model in**  
8 **stress period eight is represented by, and**  
9 **relative to your question practical saturated**  
10 **thickness, the clays that we think that are in**  
11 **the actual aquifer, we're trying to simulate**  
12 **that by lowering the hydraulic conductivity.**  
13 **USGS used well logs for that effort to find**  
14 **areas where clays did or didn't exist.**  
15 **Relative to the exercise of trying to**  
16 **generate a percentage number by index cell for**  
17 **the practical saturated thickness, again, you**  
18 **could probably do that or take a shot at it.**  
19 **The purpose of making sure we had multiple**  
20 **figures and tables was to make sure that we had**  
21 **enough information that not only the regulatory**  
22 **agencies, but the hearing process could**  
23 **understand what that level was. And so if**  
24 **someone did have a concern about practical**  
25 **saturated thickness, say, well, it may be great**

1 Q. And, again, this is just modeled results in  
2 table 2-11, correct?  
3 **A. That's correct.**  
4 Q. Clear back in December, you testified that in  
5 the event the water table was dropped, let's  
6 say, for example, 23 feet, for example, the  
7 water level was dropped 23 feet, and you have --  
8 23 feet is one of your contingencies, in the  
9 event the water level was dropped by 23 feet, I  
10 think you testified the City could then drill a  
11 domestic well lower. Is that -- was that part  
12 of your testimony from back in December?  
13 **A. Sure. I mean, I think the spirit of that**  
14 **discussion and the context of that discussion**  
15 **was we have predicted elevations that we think,**  
16 **here's actually where we're going to end up; and**  
17 **if someone identified a problem, we have the**  
18 **capacity to, at least based on the results of**  
19 **the model, it looks like we have available**  
20 **saturated thickness, an additional aquifer to**  
21 **lower a domestic well, if they had an issue, or**  
22 **whatever well, if they had an issue, based on**  
23 **the model, so I believe that was the context of**  
24 **my testimony.**  
25 Q. And I think you indicated that within a matter,

Page 999

1 and I can pull up your testimony, but I think  
 2 you indicated if there was, for example, a  
 3 domestic well that was impaired by the water  
 4 level dropping that within a matter of days a  
 5 well driller could come out, they could drill a  
 6 new well and help to address that issue. Does  
 7 that sound like your previous testimony?  
 8 **A. Yeah, I think that's reasonable.**  
 9 Q. Do you know that if -- whether or not if a well  
 10 driller were to come out and let's say in the  
 11 hypothetical of the need to lower a domestic  
 12 well by 23 feet, do you know if the water  
 13 quality is generally the same when one drills  
 14 23 feet lower versus the original level?  
 15 **A. Water quality could change. I don't know**  
 16 **whether it would or wouldn't. I don't have any**  
 17 **idea. I do know that in the instance that there**  
 18 **was a significant water quality change, I don't**  
 19 **want to speak for the City, but hypothetically**  
 20 **if that were to be negatively impacted, I'm sure**  
 21 **the City would also pursue a remedy for that**  
 22 **water quality issue.**  
 23 Q. Do you have any idea what that remedy would be?  
 24 **A. There are a number of home treatment systems.**  
 25 **The common contaminants, at least in this area**

Page 1000

1 and at least most alluvial environments, would  
 2 be iron, would be manganese, things of that  
 3 nature, natural dissolved constituents. There  
 4 are a number of treatment systems that are  
 5 readily available at the home level for that, so  
 6 I don't see that being -- being an issue.  
 7 Q. Have you specifically studied each index cell to  
 8 determine if drilling new wells would be a  
 9 viable approach?  
 10 **A. So much as -- if the determination is that we**  
 11 **have an adequate amount of saturated thickness,**  
 12 **we have an adequate amount of saturated**  
 13 **thickness, let's say, left at the end of the**  
 14 **predicted results, that would be as close as I**  
 15 **could come to saying it looks like there's**  
 16 **plenty of water and feet available in terms of**  
 17 **production.**  
 18 And even for a domestic well, even under a  
 19 situation where you had a low practical  
 20 saturated thickness, if we're talking about a  
 21 yield even for stock watering, or whatever the  
 22 case may be, to get on the order of maybe 30  
 23 gallons a minute, you can do that in lower yield  
 24 environments with much more screen interval.  
 25 You can get it in -- in sands that are a little

Page 1001

1 **bit tighter, things of that nature. So in my**  
 2 **estimate, I do think that you can generally**  
 3 **lower a well, if it was impacted, in a majority**  
 4 **of the instances here, and you have a lot of**  
 5 **saturated thickness to do that and a lot of feet**  
 6 **to do that.**  
 7 Q. As it relates to the practical saturated  
 8 thickness, are you -- do you know if simply  
 9 lowering, let's say, the domestic wells in each  
 10 index cell, do you know for certain if that's a  
 11 viable approach?  
 12 **A. Nothing is absolute in geology. We can get some**  
 13 **generalizations. Can I guarantee personally**  
 14 **right now blindly going out, without drilling a**  
 15 **hole in the ground, that you will be guaranteed**  
 16 **to get water? No, I can't guarantee that it**  
 17 **won't be 100 percent filled with concrete, it's**  
 18 **underground, you never know. But there is a**  
 19 **high likelihood based on what we do know from**  
 20 **surrounding well logs. That's basically what we**  
 21 **do as geologists is we interpret based on**  
 22 **existing data what do we think the aquifer**  
 23 **underground picture looks like, and with that**  
 24 **aquifer underground picture, which we have with**  
 25 **the model and the bedrock elevations that have**

Page 1002

1 **been produced in accordance with that and that**  
 2 **were developed by USGS, we think we have the**  
 3 **relevant saturated thicknesses and feet of**  
 4 **thickness left in terms of saturation that are**  
 5 **represented within the model results. So that's**  
 6 **the best I can do without actually going out**  
 7 **there and putting a hole in the ground.**  
 8 Q. To arrive at your conclusions, did you contact  
 9 any well drillers to help formulate the basis  
 10 for your opinion?  
 11 **A. In terms of geolocation and probability of**  
 12 **finding a producing well or turnaround, or**  
 13 **what's the question?**  
 14 Q. As far as your testimony with respect to  
 15 drilling new wells and how long that process  
 16 would take and the feasibility of doing that?  
 17 **A. That's just, that's based on my experience**  
 18 **drilling probably 30 or 40 monitoring wells at**  
 19 **this point, based on my experience of drilling**  
 20 **domestic wells and sampling domestic wells.**  
 21 **We've done large capacity wells in that time or**  
 22 **less, 30-inch bore holes or bigger. So to**  
 23 **conclude that basically we're looking at**  
 24 **anywhere from one to three days, especially if**  
 25 **someone is in dire need, to get a well turned**

1 around and knowing that well drillers do like  
2 overtime and getting paid, especially during  
3 high demand periods to run more than one crew,  
4 that's been my experience. So I would say one  
5 to three days of a domestic turnaround would  
6 still be okay.

7 Q. Earlier, back in December, I asked you if your  
8 expert testimony, of course -- well, of course,  
9 your expert testimony is limited to what's in  
10 your expert report, and I asked you if that  
11 summarized the full extent of your opinions, and  
12 I believe you said, your answer was yes back in  
13 December. Would you agree with me that your  
14 expert report doesn't indicate or analyze the  
15 impact of the City's proposal on water quality,  
16 would you agree with that?

17 A. I did not specifically look at the water quality  
18 impacts, and I don't think that's specifically  
19 included. I could generally speak to net  
20 effects of pumping, things of that nature, I'm  
21 an experienced hydrogeologist in this  
22 environment. Did I do any specific analysis for  
23 this report? No.

24 Q. With respect to whether or not the City's  
25 proposal is in the public interest, you didn't

1 specifically address the terminology public  
2 interest in your expert report. Is that a true  
3 statement?

4 A. I don't recall specifically saying specific --  
5 or public interest. If it is not in my expert  
6 report, then I obviously didn't -- didn't say it  
7 so ...

8 Q. With respect to safe yield, what is safe yield?

9 A. Different organizations have different policies  
10 that say what safe yield is. Safe yield can  
11 mean a different definition depending on where  
12 you go within the United States. Safe yield is  
13 sometimes a management policy that is a race to  
14 the bottom in terms of water level changes. So  
15 a safe yield may be we have a policy that says  
16 we are going to deplete groundwater at this  
17 rate.

18 Safe yield in other portions of the United  
19 States, in this case, for example, GMD2, means  
20 we are going to try to manage, at least through  
21 policy and rule and regulation, try to manage  
22 the aquifer in a sustainable manner where we  
23 allocate resources and new water regs based on a  
24 concept of a particular spacing interval or  
25 density of allowed pumping, based on what we

1 know about the hydrologic inputs of the aquifer  
2 system.

3 I believe GMD2 in this area manages safe  
4 yield at roughly 6 inches on average, roughly,  
5 of recharge per year, and I believe the way the  
6 agricultural regulation reads is you total up  
7 all of the water rights in a two-mile circle and  
8 look at the recharge rate of that two-mile  
9 circle, so two miles of square area multiplied  
10 by 6 inches of recharge, relative to the number  
11 of permits that have already been issued within  
12 that two-mile circle. That's the concept, at  
13 least, as GMD2 has it together as safe yield.

14 Again, there are other definitions that  
15 depending on where you go look in the country.  
16 In my experience, safe yield can mean different  
17 things to different people.

18 Q. Okay. Do you believe that the concept of safe  
19 yield, from your knowledge and understanding of  
20 water rights, do you believe that the concept of  
21 safe yield should apply to the City's proposal?

22 A. Well, the concept of safe yield here is a bit  
23 tricky because we have a complicated issue that  
24 involves bringing new water essentially to the  
25 table. So we have an aquifer storage and

1 recovery project. So that is bringing water  
2 from a transient resource, from a resource that  
3 would otherwise bypass the aquifer and head  
4 downstream to Oklahoma.

5 We take that transient resource and we're  
6 able to put it into the aquifer through physical  
7 injection, and that is kind of the general  
8 characterization of why it traditionally, I  
9 don't believe it's managed by safe yield because  
10 it is effectively bringing new water to the  
11 table, putting it in storage for a later use  
12 and, therefore, is not subject to safe yield  
13 because that water was sourced from the river.  
14 That is the concept of why it wouldn't be  
15 applicatory to safe yield.

16 Q. So with respect to the City's proposal, you, you  
17 specifically and nobody in your team analyzed  
18 how safe yield would be impacted with respect to  
19 the City's proposal?

20 A. No, other than we have water level changes and  
21 that's -- that relative impact to sustainability  
22 or safe yield.

23 MR. STUCKY: I don't think I have  
24 further questions.

25 PRESIDING OFFICER: Ms. Wendling.

Page 1007

1 You want the microphone down there?  
2

3 **CROSS-EXAMINATION**  
4 **BY MS. WENDLING:**

5 Q. So on -- in the proposal, table 2-4, we talked  
6 about the PDSI values. I believe that you  
7 talked about using the --  
8 (Reporter requests clarification.)  
9 **BY MS. WENDLING:**

10 Q. Okay. Table 2-4, the PDSI data, I believe you  
11 said you used PDSI data to find surrogate  
12 drought years, I'm probably saying it not as  
13 accurately as you; is that correct?

14 **A. Yeah, so we're -- based on Mr. Winchester's**  
15 **work, Mr. Winchester researched the available**  
16 **record on the Palmer Drought Severity Index and**  
17 **also looked at the recurrence interval of**  
18 **drought based on PDSI in correlation to**  
19 **streamflows.**

20 And for our role, once we had the demands  
21 from the City and what they wanted to  
22 essentially simulate as 1 percent drought, they  
23 said, hey, Burns & Mac, we think based on John  
24 Winchester's work and based on our own internal  
25 policy decisions, here's what we think we want

Page 1008

1 to simulate. We want to simulate a 1 percent  
2 drought, can you guys do that for us? And I  
3 said, yeah, let's -- let's take a look at that,  
4 that's our role, is let's run the Equus Beds  
5 groundwater model at the 1 percent drought  
6 level. And as I testified earlier, the USGS  
7 model kind of has a prescribed way to apply  
8 hydrologic variables. So things like  
9 precipitation that ends up as recharge, things  
10 like river flows, those are represented in the  
11 model, those are hydrologic variables that we  
12 want to represent.

13 And our first go at it was, okay, can we  
14 simply just use the values from the 1930s, that  
15 would be ideal. Then we kind of have direct  
16 apples-to-apples comparison with what was done  
17 with Mr. Winchester's work and our work. So  
18 we -- we first tried to do that, and our  
19 approach found pretty quickly that, as you'd  
20 anticipate, people back in the 1930s had much  
21 other things to worry about other than measuring  
22 rain and going out and checking staff gages and  
23 correlating all that data; especially we may  
24 have one or two points, not the entire basin.  
25 So our next step was, and it's common

Page 1009

1 practice in the modeling industry to say, okay,  
2 well, while we may not have this data, we have  
3 newer data that we can probably use as a  
4 surrogate year, so two years that matched the  
5 best that we can or in this case a series of  
6 years that match the stresses that we want to  
7 apply. So in this instance, we couldn't use the  
8 old data, so we said what new years do we have  
9 with relatively good data on pumping and river  
10 flows and precipitation, all that good data, how  
11 do we match that to the past event we want to  
12 simulate, which was the 1930s drought.

13 And PDSI, if you remember John Winchester's  
14 testimony, is one of those measures that NOAA  
15 uses, and a couple of other agencies use, to say  
16 how dry was it effectively, and then what is the  
17 duration of a drought. We can compare those  
18 PDSI values, not just for an individual year but  
19 in sum to kind of say what was the depth -- or  
20 what was the total duration of a drought,  
21 because a drought for one year is obviously a  
22 different thing than a drought for ten years.

23 So that's how we came up with the 2011 and  
24 2012 values is we said, look, if we repeat 2011  
25 and 2012, those values pretty well match the net

Page 1010

1 PDSI or the total PDSI values that were put  
2 together by Mr. Winchester and the City. So we  
3 think we're in the wheelhouse there.

4 And that's really the best we could do with  
5 the available record when we looked at what we  
6 think how pumping will actually occur, the river  
7 flows, the responses, all those things we felt  
8 like 2011 and 2012 was about the best match that  
9 we could do. So that's how we came up with it.

10 Q. Have you needed to do that type of drought  
11 reconstruction in other projects that you've  
12 worked on?

13 **A. Sure, and I think it's, again, it's fairly**  
14 **common if you have a known set of variables and**  
15 **then, let's say, how ag responded to that**  
16 **response, how the rivers responded to that**  
17 **stress, all those ingredients, then we can use**  
18 **that year as a surrogate rather than saying,**  
19 **well, what might have happened, let's try and**  
20 **recreate things based on that we think we might**  
21 **know versus, hey, this actually happened. This**  
22 **was an actual observed response of the aquifer**  
23 **system, of the river system, of precipitation,**  
24 **of recharge, and that sort of situation.**  
25 And all modeling that goes future is, of

1 course, prospective. So we're saying we know  
2 what happened in the past, that one's easy, we  
3 can measure most of it, but what can we look at  
4 in the future, what do we think is actually  
5 going to happen? And to simulate a 1 percent  
6 drought, that's -- we had to come up with dry  
7 years from somewhere, and 2011 and 2012 really  
8 just matched up pretty well.

9 Q. What was your analytical process to determine  
10 that 2011 and 2012 were the closest to the 1930s  
11 PDSI?

12 A. Sure, so we looked at the NOAA values for PDSI  
13 for a number of other years, and knowing that we  
14 had -- impacts to streamflow was another one  
15 that we looked at. Taking any one specific  
16 recurrence year, we took years that were dry;  
17 there's obviously other dry years in 100 years  
18 of record, but 2011 and 2012 also had a pretty  
19 healthy impact on streamflow, and that was  
20 another target for us is we wanted to simulate  
21 water in the streams as low, because we think  
22 that will be the case. So that's another reason  
23 that, again, 2011 and 2012 came out to just be  
24 the solution we felt like that worked best with  
25 the available data.

1 Q. Is the impact to streamflows reflected in the  
2 PDSI numbers, or is that a different source of  
3 data?

4 A. Well, PDSI is -- and maybe John -- it's a  
5 reflection -- it's not a measurement of  
6 streamflow, but it does correlate to streamflow,  
7 simply because it's just a magnitude number on  
8 the severity of drought. So, you know, the more  
9 negative the number, the -- if you were to, you  
10 know, hypothesize, you know, is negative 4, do  
11 we anticipate a bunch of streamflow in the  
12 river? Probably not. So that's about the best  
13 correlation that I can give you between those  
14 two.

15 Q. So in addition to using the PDSI data, did you  
16 use any additional data on streamflow in making  
17 the decision to use 2011 and 2012?

18 A. Yeah, and I think that's in the report, we have  
19 some streamflows that are in there that we  
20 looked at. Again, if you look at the exceedance  
21 probability of the streams for the particular  
22 years of 2011 and 2012, exceedance probabilities  
23 is if we went out there today and said, what do  
24 we think the river flow is going to be on a  
25 particular day? And you get a probability of,

1 you know, is it going to be 100 CFS, what's the  
2 likelihood of that relevant CFS number?

3 And we looked at CFS flows for 2011 and  
4 2012, and each of those years was, again, very  
5 low relative to the other years that we could  
6 have maybe possibly used to get our net total,  
7 which is what we wanted to be. We wanted to be  
8 relatively conservative in our projections,  
9 assuming that what we saw during 2011 and 2012,  
10 and I think maybe as others have elucidated to,  
11 is that we saw very, very low streamflows. We  
12 still anticipate some streamflow according to  
13 the model, but we would anticipate it to, again,  
14 be very low.

15 Q. Okay. Did you, in doing your modeling, did you  
16 model any alternative years other than '11 and  
17 '12?

18 A. No, not -- not with the proposal, no, we did  
19 not.

20 Q. So in table 2-4 again, showing the annual and  
21 seasonal differences, can you describe what is  
22 the difference between the 12-month annual PDSI  
23 and the 6-month seasonal PDSI?

24 A. Sure. I believe NOAA just calculated --  
25 calculates it two different ways. So the

1 12-month annual PDSI is how dry was the year.  
2 Over the entire period, what was that value when  
3 they calculate PDSI; it's relative to the whole  
4 year, the 12 months. The 6 month, I believe, is  
5 based on a growing season, so we kind of want to  
6 know what's the impact to crops and trees and  
7 all the things that really depend on water,  
8 outside of just us, and that's oftentimes used  
9 as, okay, well, what happens when we really need  
10 it? That number is more of a measure of the  
11 severity of impact on things like streamflow.  
12 You can have cumulative annual values and  
13 cumulative seasonal values, they mean different  
14 things to different people and different  
15 resources.

16 Q. So when you were trying to match the figures  
17 from the '30s drought, were you more focused on  
18 the annual or the seasonal, or did you look at  
19 both of them equally?

20 A. Right now, it is just basically the seasonal.  
21 Again, I think the -- the relative impact was  
22 based on seasonal. If you look at the  
23 comparison that's in the gray bars at the bottom  
24 of that table, I think we were at a cumulative  
25 for a 12 month of 21.09 negative, for the 12

Page 1015

1 month. We're actually slightly lower than that,  
 2 so we were -- we were less intense from an  
 3 annual perspective.  
 4 Again, I think there's a lot of demand on  
 5 the river system and the hydrologic system  
 6 during a specific period, so perhaps a better  
 7 match might be the 6-month seasonal. But we're  
 8 at 21.58, and we're just slightly above on the  
 9 percent negative in terms of our match at  
 10 negative 23.45. So we are slightly below or  
 11 slightly better from a drought perspective,  
 12 we're in slightly better conditions at an annual  
 13 level but slightly more severe during those high  
 14 intense periods.  
 15 Q. So are there any considerations that should be  
 16 taken based on -- in looking at the annual, the  
 17 difference between 21 and 15, that being a  
 18 larger difference, is there anything that needs  
 19 to be considered specifically due to that?  
 20 A. Not that I know of, I just think you could have  
 21 some periodic rain or another event that would  
 22 drive that number down. Or perhaps going into  
 23 the intensity, so let's say at the start of  
 24 2011, we don't know if we're in a drought,  
 25 things are actually not too bad. It's not until

Page 1016

1 the sun turns on us at 110 degrees for 90 days  
 2 straight that we know that, hey, something  
 3 serious is going on. So that can tend to skew  
 4 the value of using that annual amount versus the  
 5 6-month amount, if that makes sense.  
 6 Q. If we go to, I think it's attachment F to the  
 7 proposal which is the actual PDSI figures.  
 8 A. Okay.  
 9 Q. When you go to the figures for 1933 through  
 10 1940, will you read us the seasonal PDSI number?  
 11 A. Okay. I'm on the page that's south central  
 12 Kansas PDSI, 2376, 2865 negative, negative 8.85,  
 13 negative 23.9, negative 17.38, a positive 4.15,  
 14 negative 15.27, and negative 15.8 for the year  
 15 1940.  
 16 Q. Thank you. So in 1938 is the year that we had  
 17 the positive 4.15, correct?  
 18 A. Yes, there's a positive 4.15 in the seasonal  
 19 value, yes.  
 20 Q. So how do you describe a positive value --  
 21 positive PDSI during a severe drought?  
 22 A. It's possible that there were just some timely  
 23 rains during that time to adjust the net  
 24 deficit. I think Mr. Winchester's testimony  
 25 basically provided -- it's kind of like a water

Page 1017

1 bucket model essentially that says is vegetation  
 2 going to be satisfied, is there enough soil  
 3 water balance to go around, it's kind of how  
 4 PDSI works. So in this case, there would be a  
 5 slightly positive value.  
 6 Do note that you have to divide that value  
 7 by the 6 -- 6 to get the actual PDSI value, so  
 8 you would have to divide the 4 point, whatever  
 9 it was, 15 there by 6. So it was slightly  
 10 positive. We were still within basically a  
 11 normal range for that year. It wasn't  
 12 particularly wet according to the value, but it  
 13 would have been a wetter year or perhaps a  
 14 timely set of rainfall for that particular year.  
 15 Q. Have you considered how your simulated drought  
 16 using 2011 and 2012 would be impacted if you  
 17 were to interject one wet season into that  
 18 eight-year period?  
 19 A. Theoretically, it would make river flows better,  
 20 it would drive all demands down, probably  
 21 including the City's to some extent. It would  
 22 provide for additional recharge to the Equus  
 23 Beds, ultimately essentially would end up in  
 24 slightly higher water levels would be my  
 25 estimation of the impact of that.

Page 1018

1 Q. That wasn't incorporated into any of the  
 2 analysis -- a wet year was not incorporated into  
 3 any of the proposed minimum index levels?  
 4 A. No, no, we repeated 2011 and 2012 hydrologic  
 5 variables within the model. We did not have a  
 6 particular wet year that we simulated. The max  
 7 was based on the two PDSI values that we just  
 8 discussed.  
 9 Q. Who ultimately decided that 2011 and 2012 were  
 10 the best years to use?  
 11 A. That was done in combination with review with  
 12 the City. I looked at the norm values, and we  
 13 just discussed Mr. Winchester's values that we  
 14 just discussed, we looked at streamflows that we  
 15 just discussed, and basically landed on the  
 16 drought of 2011 and 2012 was both, I think,  
 17 representative of both intensity and potential  
 18 duration. So we captured the things that we  
 19 wanted to capture in drought to make that stress  
 20 the best we think is possible for a projected  
 21 drought into the future. So it was a  
 22 coordination effort between Burns & McDonnell,  
 23 myself, and the City to say, here, we think this  
 24 is about the best match to your 1 percent  
 25 scenario.

1 Q. Okay. Going back to table 2-5 in the proposal  
2 where we talked about the inputs, the fifth row  
3 down, irrigation, industrial, and other well  
4 pumping.

5 **A. Okay.**

6 Q. Can you describe what other well pumping  
7 includes?

8 **A. Any other -- trying to think what else might be  
9 captured. We've got irrigation in the model,  
10 we've got industrial demands in the model, and  
11 then we would have other municipalities that  
12 would be in the model, so Halstead, Newton.  
13 Anybody else who's on municipal water right  
14 would have been represented within the model.**

15 Q. So other well pumping would be those other  
16 municipalities?

17 **A. Yeah, yeah, sure.**

18 Q. And this is based off of the actual data  
19 reported to DWR?

20 **A. Right, with the exception we discussed earlier,  
21 the net irrigation value. We apply that based  
22 on the type of system that's recorded with the  
23 water use reports and adjust accordingly.**

24 Q. Is there any water use that's not reported to  
25 DWR?

1 table?

2 **A. Well, from the standpoint that the existing  
3 industrial user had used water in 2011 and 2012,  
4 if they were anticipated to grow, or something  
5 like that, an increase in their water use  
6 wouldn't necessarily be addressed here. The  
7 majority of the water use comes from, again, the  
8 City and ag users, so we felt like those were  
9 the -- probably the best focus to come up with  
10 accurate results.**

11 **I couldn't tell you the quantity of  
12 industrial users or the quantity of the other  
13 municipalities, just that their pumping was  
14 represented, and if they pumped something in  
15 2011 or if they pumped something in 2012, those  
16 are within the model.**

17 Q. Okay. And we talked at length earlier so I just  
18 want to try and understand that the City in  
19 using MODSIM-DSS was using the historical data  
20 from 1933 through 1940 in doing -- in their  
21 analysis?

22 **A. I believe that's correct. The best person to  
23 answer that is probably Mr. Winchester. Again,  
24 I didn't generate that work, but I believe he  
25 looked at streamflows and in general how Cheney**

1 **A. Probably domestic wells. I believe there's an  
2 exemption for stock watering at a certain value  
3 that doesn't require a water right. Anything  
4 that's in here that's not a water right is not  
5 going to be a reported pumping value, it's not  
6 going to be a represented well in the model.  
7 I'm trying to think if there's anything else. I  
8 don't know of any others offhand, but that would  
9 be the general characterization.**

10 Q. Is there any estimate of the value of  
11 non-reported pumping?

12 **A. I don't have any of those offhand. GMD or  
13 someone else may have taken a shot at that  
14 previously; I don't have those values off the  
15 top of my head.**

16 Q. And the pumping figures, as we talked about  
17 earlier, represent what was actually occurring  
18 without -- other than your irrigation adjustment  
19 in '11 and '12?

20 **A. That's correct.**

21 Q. Not forecasted for what would happen in 2060?

22 **A. Correct, for a municipality or an industry, we  
23 didn't do any additional projections for those.**

24 Q. So a new industry utilizing more water would  
25 not -- by 2060 would not be represented on this

1 **was the focus of that, how Cheney would respond  
2 during the 1930s drought to generate the inputs  
3 to Cheney, which is a big controller on how  
4 water is apportioned within the MODSIM model.**

5 Q. Mr. Stucky asked you about the Bentley well  
6 field and the E&S well field and that  
7 availability, and you mentioned that that  
8 flow -- or the availability of water is  
9 dependent on flow from the river and that during  
10 2011 and 2012 the flow was low; however, you  
11 indicated that there was still pumping at those  
12 sites, correct?

13 **A. Uh-huh, sure.**

14 Q. But you made a comment that during a severe  
15 drought, you would anticipate even lower flows  
16 in --

17 **A. Sure.**

18 Q. -- the river; is that correct?

19 **A. I think a general characterization of drought is  
20 we would anticipate as duration, continue to  
21 grow, and actually, again, I --**

22 **(Reporter requests clarification.)**

23 **A. The first time I saw the document, I did make a  
24 note that we saw more pumping in 2011 than we  
25 did in 2012 from those particular resources, and**

Page 1023

1 I think that pattern would absolutely continue  
 2 to occur. So maybe we had the opportunity to  
 3 take in the first year a chunk of water when  
 4 water levels and -- or, excuse me, as I said,  
 5 river flows would be good, and as river flows  
 6 declined on the Ark River, they're both Ark  
 7 River resources, the yield of those wells and/or  
 8 the permit conditions that allow for actual  
 9 withdraw of water from those wells may not be  
 10 there.  
 11 So that was the, essentially the answer of  
 12 why those resources may not be firm sources of  
 13 supply or would, at least, be anticipated to  
 14 drop in yield precipitously, especially for the  
 15 E&S well field, which is in a shallower system,  
 16 during drought.  
 17 **BY MS. WENDLING:**  
 18 Q. So the City also has rights to withdraw water  
 19 from the Little Arkansas River for recharge or  
 20 sending that directly to Wichita for use; is  
 21 that correct?  
 22 **A. That's correct.**  
 23 Q. And that permit also has triggers based on  
 24 streamflow; is that correct?  
 25 **A. That's correct.**

Page 1024

1 Q. How does the model account for that -- the  
 2 stream -- reduced streamflow and the ability to  
 3 meet the minimum desirable streamflow in order  
 4 to utilize that water, is that factored into the  
 5 model?  
 6 **A. It is so far in that we -- we assumed that**  
 7 **during the drought we would not be able to**  
 8 **capture recharge credits. With the Little Ark**  
 9 **River going to be anticipated to be very low**  
 10 **during the majority of the duration of the**  
 11 **eight-year drought, we did not anticipate taking**  
 12 **any water from, at least source water from ASR**  
 13 **Phase I or Phase II; in other words, we would**  
 14 **not be capturing water from the Little Arkansas**  
 15 **River, we wouldn't anticipate those permit**  
 16 **conditions to be -- allow that, facilitate that,**  
 17 **river elevations wouldn't be where they need to**  
 18 **be, flows wouldn't be where they need to be.**  
 19 **And then from a planning standpoint, we felt**  
 20 **like it was pretty prudent to assume that.**  
 21 Q. So as -- the Little Arkansas is not used as a  
 22 water resource during the eight-year drought  
 23 period?  
 24 **A. That's correct, yeah.**  
 25 Q. You mentioned that while you did not do the

Page 1025

1 allocation of demands between Cheney and Equus  
 2 Beds, that was done by the City, you believe  
 3 that allocation to be reasonable. Did I hear  
 4 that correctly?  
 5 **A. I think so. My understanding of the model, and**  
 6 **I have viewed the code, while I didn't run the**  
 7 **specific set of model parameters and tweaks that**  
 8 **were in the report, I understand generally how**  
 9 **MODSIM works. The pipeline values and the**  
 10 **blending requirements and the other things that**  
 11 **are in the model, I think, are reasonable.**  
 12 Q. And you specifically looked at all of the inputs  
 13 to that model, or you just know based on how the  
 14 model functions?  
 15 **A. I know of the model's function and of its**  
 16 **relative simplicity. I mean, black box models**  
 17 **can be kind of a scary thing. Again, it's**  
 18 **basically a calculator on steroids or an Excel**  
 19 **spreadsheet on steroids, it just has some coding**  
 20 **that allows us to make those optimized resource**  
 21 **decisions. So from that standpoint, it's**  
 22 **relatively, I won't say bulletproof, it's**  
 23 **just -- it's not as complex as what it sounds.**  
 24 **So for that reason, I think it to be a fairly**  
 25 **robust and common method for resource management**

Page 1026

1 **and -- and reasonable based on the allocations**  
 2 **of resources that are in there. Nothing red**  
 3 **flagged when the City gave me, Daniel, please**  
 4 **simulate this amount of demand from the Equus**  
 5 **Beds and the ASR well field, nothing hit me as a**  
 6 **red flag to say that's too much or too little in**  
 7 **other words.**  
 8 Q. But did you review the input to the MODSIM  
 9 model?  
 10 **A. No, no, I have not in detail, no.**  
 11 Q. And one simple typo or one positive when it  
 12 should have been a negative could dramatically  
 13 impact the results?  
 14 **A. If you wanted to think of it that way. If you**  
 15 **set a variable that was outside of the**  
 16 **conditions or something of that nature, sure.**  
 17 Q. So while the tool functions in a reasonable  
 18 manner, without really reviewing the input, how  
 19 can you know that the output is reasonable?  
 20 **A. For this specific instance of them running the**  
 21 **model, I just know that the relative**  
 22 **distribution to the Equus Beds, I think, is**  
 23 **reasonable relative to Cheney, knowing what I do**  
 24 **about the blending requirements and some of the**  
 25 **other things. Again, I didn't review the inputs**

1 in detail, but do I think the quantities are  
2 reasonable, are they, you know, an order of  
3 magnitude off, or something like that, that  
4 would be my take on it.

5 Q. Table 2-5, once again, has the two years of  
6 recovery model.

7 A. Okay.

8 Q. When you're doing drought reconstruction  
9 projects, do you typically model a recovery  
10 period?

11 A. It depends, it depends on the duration of that  
12 event. We may want to understand two things, we  
13 may want to understand how the aquifer depletes  
14 or as water levels drop, how that's occurring.  
15 The flip side of that is from a water resources  
16 management standpoint, if you're a municipality,  
17 you're also interested in how fast it recovers.  
18 From an ASR standpoint, from just a pure ability  
19 to pump it back out of the ground, we kind of  
20 wanted to know that. And so we ran those two  
21 additional recovery years, number one, to make  
22 sure that we didn't continue to see water levels  
23 decline, despite everything kind of coming back,  
24 the system coming back to life and going back to  
25 normal; and the other side of that is just

1 the flip side of this is when things go back to  
2 normal in a 1 percent drought, how do things  
3 come back?

4 Q. And what is normal?

5 A. It would be within the bands of that relative  
6 PDSI or even slightly wet. So 2010 was kind of  
7 a relatively normal year, I think it was  
8 slightly positive PDSI, so we wanted to simulate  
9 things kind of coming back from a hydrologic  
10 standpoint, river flows, additional recharge,  
11 get out of the dry spell of the drought, come  
12 back into, quote, normal period, and then just  
13 run that for two years was the decision to see  
14 how water levels changed and came back, if they  
15 did.

16 Q. Is there a normal water level for the aquifer  
17 itself?

18 A. Well, there's -- there's 100 percent full, which  
19 was predevelopment; that would be basically no  
20 pumping. So all of the rain that would fall  
21 within the basin would basically either run off  
22 or percolate downward if it wasn't absorbed by  
23 plants and that sort of thing. It would fill up  
24 the aquifer, and that -- that aquifer would be  
25 leaking essentially back to the rivers; that is

1 understanding how fast it would come back up.

2 Q. Now, in the proposal -- or one of the documents  
3 says that the recovery was modeled at the  
4 request of DWR and GMD2. Was it their decision  
5 to request the recovery, or was that a  
6 proactive --

7 A. I think it was a collaborative discussion to  
8 include it. Could have included it, could have  
9 not included it. In general, I don't think we  
10 saw any declines outside of stress period eight,  
11 and we wouldn't have anticipated any. Knowing  
12 that the magnitude and the change of the  
13 relative dryness compared to a normal wet, or  
14 even normal periods, we just would anticipate  
15 those normal periods providing enough  
16 contribution that in theory, stress period eight  
17 should have been the lowest recorded year.

18 So that was kind of our goal is come up  
19 with what's the bottom or what's the lowest  
20 recorded year. But we discussed, I think, with  
21 GMD2 and maybe some with DWR that there might be  
22 some value in looking at the recovery period  
23 just to, number one, ensure that we didn't  
24 continue to see drops; and then, number two,  
25 what does recovery look like. I think that's

1 essentially steady state or predevelopment. In  
2 other words, there is not a lot of pumping,  
3 things are as full as they're going to get.  
4 That would be the only thing I could say as  
5 normal. The rest of the time we're kind of in  
6 flux, we have wet years, dry years, we see  
7 different pumping patterns over those different  
8 years, and so everything is kind of always  
9 changing.

10 Q. So what signals to you the aquifer has recovered  
11 post drought?

12 A. Water level changes are probably the best  
13 indicator of what's going on in the unconfined  
14 system we have. That tells you a couple  
15 different things. It tells you where you're at  
16 from a storage perspective. It kind of gives  
17 you a meter on where you're at to -- to other  
18 relevant points in history. Water levels are  
19 just a pretty -- pretty genuine valuable tool  
20 for measuring that; that's the common practice  
21 to measure how much storage we have underground  
22 right know, that's pretty commonplace.

23 Q. Going to attachment I of the proposal, it's a  
24 map before of a hydrograph.

25 A. Simulated drought results recovery of ASR

Page 1031

1 credits limited by minimum index level  
 2 elevations, that one?  
 3 Q. Yes.  
 4 A. Okay.  
 5 Q. What factors caused some of these boxes to be  
 6 shaded while others are not?  
 7 A. Well, couple different things. If I was just a  
 8 hydrogeologist, I'd never seen this before, I  
 9 would say, okay, where -- where would I  
 10 anticipate water levels to be the highest, both  
 11 during drought or normal conditions? Rivers  
 12 would be a good place to start where despite a  
 13 lot of pumping, let's say, from pre-1990  
 14 conditions. Here, I would anticipate along the  
 15 rivers to have relatively high water level  
 16 conditions as compared to other places. Rivers  
 17 provide a nice donation under dry conditions as  
 18 a donation back to the aquifer. So under those  
 19 conditions I would anticipate those areas to be  
 20 fuller relative to others.  
 21 If I was looking at this, again, blind and  
 22 saying, okay, where are the -- where are the  
 23 triangles on the map that say these are pumping  
 24 wells, I would anticipate the core water level  
 25 changes, if we're talking about these wells

Page 1032

1 pumping a lot, to be kind of where they are  
 2 within the red outline of the USGS central well  
 3 field storage area.  
 4 So the reason some of these don't go below  
 5 the 1993 levels is probably just a function of  
 6 the 1993 levels being what they are. Some areas  
 7 we don't have the pumping density to drive it  
 8 there. 1993 levels may have been something as  
 9 simple as they just were still relatively full  
 10 conditions back then and relatively full  
 11 conditions in the starting conditions of 1998.  
 12 So that would be the reason why each one of  
 13 these is not necessarily filled out as a shaded  
 14 area that drops below the 1993 level.  
 15 Q. And what drives the decision on how much to pump  
 16 from the index cell?  
 17 A. We distributed pumping in the model based on how  
 18 the City actually pumps based on well capacity.  
 19 Some wells have better rights than others under  
 20 the City's base rights. Some wells are just, in  
 21 general, better pumpers than others.  
 22 So we distributed City pumping based on the  
 23 City's recommendation; they provided us with a  
 24 list of wells, and here's what we think we're  
 25 actually going to pump out of these specific

Page 1033

1 wells. And, logically, recovery of ASR credits  
 2 would probably happen in that same pattern. You  
 3 would recover more ASR credits from stronger  
 4 pumping wells than you would from other wells  
 5 that were weaker pumpers, just to meet that net  
 6 demand total.  
 7 Q. So you said that stronger pumper versus weaker  
 8 pumper or better pumper, what do you mean by a  
 9 better pumper?  
 10 A. Sure. Some of the City's wells go as high as  
 11 maybe 1200 gallons per minute, as an example,  
 12 and good yield, higher pumping capacity, it's  
 13 just a better well. We've got more aquifer  
 14 saturated thickness, the sands that we  
 15 encountered when we drilled the well might have  
 16 been better sands, cleaner sands, they transmit  
 17 water better, which makes for a more higher  
 18 capacity well. Other areas, we're not that  
 19 lucky, we may have a well that's 600, 700  
 20 gallons per minute.  
 21 So we didn't want to assume that, well,  
 22 let's assume that we just pumped 1200 gallons  
 23 per minute, as an example, from every well and  
 24 we do it uniformly. In reality, we wanted to  
 25 have that -- that allocation of where we think

Page 1034

1 we actually are going to take water. That's  
 2 going to feed things like how water levels  
 3 change through time, especially in a drought  
 4 response model. So we felt it better rather  
 5 than just uniform distribute pumping, let's say,  
 6 to all the City's well field evenly in that  
 7 example, let's -- let's actually take it how we  
 8 think we're going to take it for our best  
 9 knowledge based on our existing infrastructure.  
 10 Q. So a better pumping well has nothing to do with  
 11 a well's actual infrastructure; it's more about  
 12 the conditions below surface?  
 13 A. Yeah, you bet.  
 14 Q. And that's outside of the City's control?  
 15 A. For the most part. I mean, we -- we do our  
 16 diligent effort to find the best hole in the  
 17 ground we can but ...  
 18 Q. Okay. If the City chooses to redistribute  
 19 pumping, will that change the color shading,  
 20 then, on this?  
 21 A. Yeah, absolutely, and I believe I testified even  
 22 earlier that's one of the reasons for  
 23 contingency. In my experience, there hasn't  
 24 been a well field that I worked in that's  
 25 100 percent functional all the time. Wells, we

1 like to think of them as simple objects, they're  
2 a hole in the ground, but we have things like  
3 pumps and variable frequency drives and we have  
4 things like weather and lightning, we have  
5 pipelines, all those things are mechanical, so  
6 it's never 100 percent, and so you could have a  
7 redistribution based on that.

8 You could have a redistribution, frankly,  
9 based on we have higher water levels in an area,  
10 we want to pump that area more focused than an  
11 area with lower water levels. So we could  
12 actually redistribute to the benefit of water  
13 level changes, as an example, within the  
14 aquifer. But that's one of the reasons we added  
15 contingency is just for some of those unknowns  
16 that are just like that.

17 Q. You talked about -- we talked about possible  
18 infrastructure changes to wells, and you said a  
19 cost benefit analysis would not support those  
20 changes in your opinion; is that correct?

21 A. Yeah, basically, if we wanted to, let's say, go  
22 convert the smallest down tube on a well to an  
23 even smaller down tube, if we have a recharge  
24 event available, let's say, in Little Arkansas  
25 River, we've got water available, we got 15 MGD

1 of plant, the plant's pumping, we send that out  
2 to our well field, does it make sense from a  
3 investment standpoint, does it make sense from a  
4 viability standpoint to try and inject 50  
5 gallons per minute for, let's say, duration of  
6 an event, maybe two, three weeks, then have to  
7 redevelop that well for just simple  
8 infrastructure reasons? Typical ASR well  
9 operation, you inject and then just as a  
10 function of taking care of that well, you have  
11 to redevelop. The redevelopment time on that is  
12 at a high rate, often at times, I believe, some  
13 of the design rates are even at 1200 gallons per  
14 minute. It's just not feasible to achieve the  
15 City's goals.

16 And right now we already have a number of  
17 recharge wells that are effectively idle.  
18 Again, we don't have the recharge capacity even  
19 if we wanted to go make each well 25 gallons per  
20 minute, 10 gallons per minute. To achieve the  
21 City's goal of establishing roughly 50 to  
22 60,000 acre-feet of credits just wouldn't happen  
23 even if we wanted to go and reinvest and make  
24 the down tube smaller and try and make the  
25 infrastructure work, it just doesn't with the

1 water levels that we're at. I just don't think  
2 it would be feasible, economical. I mean, I  
3 could run the numbers at some period but just  
4 don't think it would be recommended.

5 Q. So when you planned for Phase II, were higher  
6 water levels not contemplated?

7 A. They were very much. The concept of ASR, as I  
8 recall, especially Phase II, was for - and there  
9 were additional phases contemplated beyond Phase  
10 II - was not just a singular or, as we're  
11 talking about it today, 1 percent drought event  
12 or -- it was very much drought oriented, but it  
13 was also contemplated as a daily source of  
14 supply. So not just from a year to, you know,  
15 ten years later event but almost as a daily  
16 source of supply to meet peak day demands; that  
17 was the concept.

18 And so that also piggybacks on top of the  
19 City using much more of their base water rights.  
20 So instead of using, as we've seen in history  
21 since 1993, roughly 20,000 acre-foot on average,  
22 the City pumping on the order of maybe 30 or  
23 35,000 acre-feet, so tipping the balance,  
24 keeping water levels low just to meet demands,  
25 based on the previous projections and at the

1 time that the project was contemplated, that's  
2 what we anticipated was something operating the  
3 project during lower conditions.  
4 Since then, we've seen from the City's  
5 resource management we are at a historic high.  
6 We can tell a story that a lot of places in  
7 Kansas can't. We're at near predevelopment  
8 conditions, 98, 97 percent full. Ballpark, USGS  
9 puts out a report generally either every year,  
10 every other year with pretty good grade score on  
11 where we're at.

12 Q. Is that even today, currently, we are at 97, 98  
13 percent?

14 A. I believe that's correct, yeah. I don't know  
15 the exact value off the top of my head, but  
16 we're -- we're pretty good condition, yes.

17 Q. And are you familiar with the decision by the  
18 City almost two years ago to pump as  
19 aggressively as they could from the Equus Beds  
20 in order to make room for recharge credits?

21 A. I don't know of the policy decision. Other  
22 minds will be able to speak to the internal  
23 policy decision, I'm not in charge of water  
24 resource optimization for the City. I know that  
25 they did make a management decision. From the

Page 1039

1 **City's perspective, right now they have one way**  
 2 **to accumulate recharge credits and that's to**  
 3 **physically put it in the ground.**  
 4 Q. I'm aware of that, do you -- if the City, and  
 5 let's assume that you were aware of this  
 6 decision, has been pumping as aggressively as  
 7 they can from the Equus Beds for two years,  
 8 should they now be able to accumulate recharge  
 9 credits?  
 10 **A. It depends on what they've pumped in total.**  
 11 **Again, I think the concept that we talked**  
 12 **earlier was maintaining water levels much, much**  
 13 **further than where we're at now. I mean, the**  
 14 **report itself, we're talking about initial**  
 15 **condition of roughly 1998, starting condition,**  
 16 **so that's -- that's a little bit different than,**  
 17 **you know, let's say, a 5- or 10-foot water level**  
 18 **change within the well field.**  
 19 I think the decision to pump additional  
 20 water supply out of -- or pump base water rights  
 21 in excess of roughly more than 20,000 acre-feet,  
 22 which would result in depletions based on  
 23 average water use, it's going to take awhile to  
 24 get there. I don't recall what the last two  
 25 water use years totaled from the City. Anything

Page 1040

1 in excess, based on my knowledge of the system,  
 2 I think the sustainable supply is roughly  
 3 30,000 acre-feet, something of that order, when  
 4 you combine municipal supply and ag supply.  
 5 And we can kind of see that in some of the  
 6 documents that are within the report. Water  
 7 levels go up, ballpark 30,000 acre-feet of net  
 8 between the City and other users; water levels  
 9 go down when we exceed that value, so it's  
 10 somewhere in there. So it would take -- I don't  
 11 recall again what the City used in the last two  
 12 years, so that would probably be why we're not  
 13 at, as an example, sustained 15 million gallons  
 14 a day or 30 million gallons a day, simply  
 15 because we haven't reached a level, we're not  
 16 there yet, that we can sustainably recharge that  
 17 number.  
 18 Q. Do you know how long it will take to get back  
 19 down to the 1998 level?  
 20 **A. I don't. I assume it would parallel, if you**  
 21 **looked at history, same -- similar number of**  
 22 **years. I don't have that off the top of my**  
 23 **head. It's something you could model**  
 24 **potentially, it's probably how I would approach**  
 25 **it, but I don't have that number as I sit here**

Page 1041

1 today.  
 2 Q. Okay. Let's turn back to figure 14, the  
 3 operations report.  
 4 **A. Okay.**  
 5 Q. The data in -- it's page 3-12 of the proposal.  
 6 I understand the data in this table to be a  
 7 snapshot of time in 2016?  
 8 **A. Yeah, January of 2016 would be how this -- at**  
 9 **least the water levels that are in there, that's**  
 10 **what it's based off of, yes.**  
 11 Q. And is it the intention that the operations plan  
 12 will always be based off of a January water  
 13 level measurement?  
 14 **A. I think that was the concept in the draft**  
 15 **operations plan. I don't know that the City is**  
 16 **opposed to any other time of the year or**  
 17 **anything of that nature, but the current concept**  
 18 **is January just because that applies a nice,**  
 19 **uniform, kind of things are at static at that**  
 20 **point, the best you're going to get, kind of**  
 21 **gives you an -- the best eyeball of storage**  
 22 **capacity at any given time.**  
 23 Q. Okay. And the operations plan is how you  
 24 achieve the far right column, available physical  
 25 recharge capacity; is that correct?

Page 1042

1 **A. That's correct, yes.**  
 2 Q. So the plan would be to calculate available  
 3 physical recharge capacity in January of each  
 4 year?  
 5 **A. Yeah, in this draft example, absolutely, yes.**  
 6 Q. And water levels are typically higher in January  
 7 than they are in, say, July; is that correct?  
 8 **A. In general, yes. Yeah.**  
 9 Q. So you are going to have more storage capacity  
 10 in July?  
 11 **A. I would say more temporary storage capacity.**  
 12 **And from an operational standpoint, we did think**  
 13 **about that, the role of January versus, let's**  
 14 **say, July. Each one of these wells is kind of**  
 15 **its own beast, and so from a conservative**  
 16 **planning standpoint, when you say the City has**  
 17 **to plan on what can we -- what can we physically**  
 18 **inject, I think the City said they are committed**  
 19 **to trying to physically inject anything they**  
 20 **can. But outside of their own pumping, some of**  
 21 **these wells are adjacent maybe potentially to**  
 22 **others. Certainly, ag demand during July I**  
 23 **would anticipate to increase which would cause**  
 24 **water levels to lower. But having a permit**  
 25 **condition tied to what another user may or may**

1 not do.  
2 Also when you think about the concept of  
3 the project, we take water from the Little  
4 Arkansas River when it's available, and that  
5 generally happens when, of course, it's raining  
6 and we have higher than normal river flows. And  
7 so that doesn't necessarily correlate with ag  
8 pumping. So that was another spirit or thought  
9 in why we picked January. It doesn't mean that  
10 it couldn't be another level, it's just one of  
11 the reasons that we picked January.  
12 Q. Have you prepared any other operations plan  
13 based on a date other than January 2016?  
14 A. Not in the proposal, no.  
15 Q. Have you ever done this outside of the proposal?  
16 A. Not that I know of other than the discussion we  
17 just had and we contemplated what other  
18 potential elevations might make sense, what  
19 other, you know, data could we base a decision  
20 off of, which ultimately led to the January  
21 number.  
22 Q. And how was 2016 selected?  
23 A. 2016 is just an example. So we would do this  
24 conceptually every year. So if we went out in  
25 January of this year and we measured water

1 levels, that would come up to a total number  
2 that we think we can physically inject based on  
3 what the water levels were for January of 2020.  
4 You could implement this potentially as a permit  
5 condition, to say here's what your potential  
6 AMCs are, or this is basically put your money  
7 where your mouth is in terms of you say you're  
8 going to physically inject it, how do we know  
9 you're going to do it, show us on paper, show us  
10 in a permit condition, this is that concept. It  
11 may not be perfect, but it's a really good  
12 start, we think.  
13 Q. And can you identify which columns on figure 14  
14 are impacted by the City's infrastructure?  
15 A. Sure, so the two -- no, the -- well, just count  
16 from the -- count from the right, the second  
17 from the right and the third from the right,  
18 labeled as maximum well infrastructure recharge  
19 rate and minimum well infrastructure recharge  
20 rate.  
21 Q. Which, then, ultimately impacts the final  
22 column, so the last three on the right? Is that  
23 correct?  
24 A. Well, so the physical recharge capacity relative  
25 to -- when I say infrastructure, I mean a pipe

1 or I mean something physical, a physical  
2 limitation, other than just the aquifer, an  
3 infrastructure limitation, something of the  
4 City's own cause here, of a engineering design,  
5 that would steer, it's at least two pieces of  
6 the answer to the final column, yes.  
7 Q. Okay. And so as I look at your operations plan  
8 for 2016, do I read this correctly to show that  
9 there would not be any physical recharge?  
10 A. Well, we could try and put 1.18 MGD into the  
11 ground, or 819 gallons per minute in the ground.  
12 The proposal contemplates a minimum that  
13 correlates to roughly the 5 million gallons a  
14 day just as an operational trigger. Again, it's  
15 difficult to try and squeak water in at, you  
16 know, even in this instance, 162 or 196 or  
17 126 gallons per minute and then following that  
18 event, just simply have to redevelop it back  
19 out, it doesn't necessarily provide a net  
20 benefit. And also there's residence time in the  
21 pipelines and a couple other operational  
22 considerations where basically 5 MGD represents  
23 kind of an operational minimum where it's  
24 physically -- our physical capacity to get into  
25 the pipeline, up and around the horn and into

1 the wells that we want to recharge and to have  
2 capacity, it just takes roughly 5 MGD to do that  
3 to keep the whole system moving.  
4 Q. So based on this, would you anticipate if you  
5 were to review the 2016 accounting report there  
6 would be no recharge for 2016?  
7 A. No, not at all, not at all. So, remember, the  
8 City's goal here is sustained recharge values.  
9 So recharge basin 36 has been a nice wide spot  
10 in the road. Unfortunately, water levels in  
11 that area are extremely high and the retention  
12 rate at recharge basin 36 in terms of if we put  
13 water in the ground, how much of that ASR credit  
14 do we actually retain is not very high.  
15 The other piece of it is the wells can  
16 take -- I think as I mentioned before, we can  
17 inject at 1200 gallons per minute, we just can't  
18 do it for a duration that's viable to create  
19 recharge credits. So we can -- we can, as an  
20 example, maybe inject 1200 gallons per minute  
21 for five minutes, but we can't do that  
22 sustainably.  
23 The numbers that are in this report are  
24 from sustainable injection based on actual  
25 observed data. So we have looked at what we

Page 1047

1 think the wells will actually do based on  
 2 physical, actual observations to come up with,  
 3 hey, if we want to put it in the ground, which  
 4 the City does, can we actually do it based on a  
 5 given water level elevation and how the well  
 6 actually behaves. That's the -- that's the goal  
 7 of this table.  
 8 Q. So if the 2016 annual accounting report has  
 9 roughly 3,000 acre-feet of recharge, you're  
 10 saying that's just because the City will try to  
 11 recharge whenever they can?  
 12 A. No, I don't recall where that recharge occurred.  
 13 My guess would be a big chunk of that would be  
 14 recharge basin 36. I do know that each one of  
 15 the wells -- again, we have a SCADA shutoff that  
 16 is based on a 10-foot level. I have physically  
 17 been at the wells during the commissioning and  
 18 seen wells shut off based on that 10-foot  
 19 adjustment, so I know that that is a limitation.  
 20 That's also for protection of the infrastructure  
 21 at the individual well.  
 22 Q. Well, if you have -- I think on the floor next  
 23 to you are the GMD2 exhibit books.  
 24 A. Sure.  
 25 Q. There's Volume V and it's Exhibit 75, to the

Page 1048

1 right of you.  
 2 A. Volume?  
 3 Q. Volume V.  
 4 A. Okay.  
 5 Q. Exhibit 75.  
 6 A. What was the exhibit number?  
 7 Q. 75.  
 8 A. Okay.  
 9 Q. And if you are able to flip to page 2-3, it's  
 10 page 2-3, table 2-2 shows the metered recharge  
 11 for 2016.  
 12 A. Okay.  
 13 Q. So based on what you're able to see from the  
 14 2016 accounting report, why do you see such a  
 15 discrepancy between the operations report and  
 16 what actually happened?  
 17 A. Just looking through this, give me a second. So  
 18 I think I can explain what we've got going on  
 19 here in terms of the City's goals. So the  
 20 purpose of AMCs is that we know that recharge  
 21 capacity is physically limited based on the  
 22 actual operation of the wells. In this  
 23 instance, I'm looking at table 2-2 which  
 24 indicates roughly -- and it doesn't discriminate  
 25 between which is Phase I and Phase II, but looks

Page 1049

1 like the Phase II wells are represented where we  
 2 have roughly 3,000 acre-feet.  
 3 So the City's goal is to build sustained  
 4 recharge credits over time. Again, we have a  
 5 plant that can operate at either 15 million  
 6 gallons a day or 30 million gallons a day. The  
 7 City's job is to build roughly 50 to 60,000  
 8 acre-feet of credits for drought as fast as  
 9 possible. They simply can't do that with the  
 10 existing infrastructure. And their existing  
 11 infrastructure is in this case, ironically,  
 12 hindered by their own water resources  
 13 management.  
 14 So in this instance, we probably have some  
 15 wells that can take water during some events but  
 16 not for a sustained period of time. So perhaps  
 17 for a day or a period of hours, and if you  
 18 repeat that process over a period of days -- or  
 19 a period of hours, you can get to some of these  
 20 totals.  
 21 What I can tell you is from an operations  
 22 management standpoint and the ability to do that  
 23 consistently, it becomes very challenging. It  
 24 also -- again, it's kind of like the eyedropper  
 25 approach to recharge. Is it effective versus

Page 1050

1 the alternative that the City has to simply pump  
 2 down to create recharge credits? I think  
 3 that's -- that's why we see a discrepancy here.  
 4 It's not that we can't recharge. Maybe I need  
 5 to make that clear for the record, it's not that  
 6 the value is zero. There's nothing that stops  
 7 us from trying to squeak water into the ground,  
 8 but from a practical operations standpoint, from  
 9 a standpoint of creating recharge credits for  
 10 the City to later use at an additional point in  
 11 time relative to drought, it's difficult to do  
 12 with the water levels that we have now. And so  
 13 that was the spirit of the operations plan is to  
 14 reflect how the City can operate during  
 15 sustainable events. So we've had multiple  
 16 events in this case would be my guess why we  
 17 have some more than what's predicted in the  
 18 operations plan, the observed operations plan.  
 19 Q. So at water levels above 1998, ASR Phase II is  
 20 not able to sustainably accumulate recharge  
 21 credits, is that the problem?  
 22 A. Well, it's -- it's maintaining recharge capacity  
 23 with your source water capacity. The two have  
 24 to be compatible for us to -- or the City to  
 25 accumulate credits at a rate that we're actually

1 going to be able to be drought prepared in,  
2 let's say, 10 years or 12 years, whatever the  
3 City's goal is. And that's why we see -- this  
4 table is based on operating the wells in a  
5 manner where they don't shut off after 30  
6 minutes or an hour or a day. We want to have  
7 that capacity, again, day in, day out, we know  
8 that we can send water to that well on this day  
9 based on how the well behaves.

10 In this instance, I believe in 2016 what  
11 the City was doing was running the wells until  
12 they shut off with SCADA. And if they could do  
13 that for a day, water levels go back down the  
14 casing, do it again for the next day. That  
15 would be my guess as why we have some water  
16 levels -- or some recharge capacity in 2016  
17 versus the operations plan.

18 Q. Is there data that shows a drought is imminent?

19 A. I wish I had a crystal ball. I hope not. I'm  
20 not a big fan of drought, not my favorite thing.  
21 So I -- again, I don't have a crystal ball, I  
22 can't predict the future.

23 Q. There seems to be a lot of focus on accumulating  
24 these credits as soon as possible, and I didn't  
25 know if there was data behind that or if it's

1 A. That's correct, the starting level elevation in  
2 the groundwater flow model was based on 1998  
3 conditions.

4 Q. And who recommend 1998?

5 A. We collaborated with the City, the City and  
6 Burns & Mac looked at that, and I feel like 1998  
7 is reasonable. We looked at that kind of  
8 jointly. I didn't specifically do that work, I  
9 didn't model whether the aquifer would take that  
10 much water or not during that time. Do I think  
11 that that is a reasonable number? Yes. Did I  
12 come up with it? No. That was a discussion  
13 with Burns & Mac and the City where we basically  
14 came up with 1998 as a reasonable starting  
15 condition, we think.

16 Q. And for how many years have we been at an  
17 aquifer level that's prevented ASR Phase II from  
18 meeting its intended goal?

19 A. Well, I mean, commissioning the plant roughly in  
20 2013, we had some recharge capacity directly  
21 after drought, certainly wasn't full, sustained  
22 capacity at 30 million gallons a day for the  
23 plant. There was some pretty good recharge when  
24 we had it actually available after the drought,  
25 I believe in maybe 2014, '15, something like

1 merely a preference?

2 A. I think it's just prudent planning from a  
3 municipality standpoint. Whether you're an  
4 individual, a municipality, an industry,  
5 whoever, if you have the opportunity to have  
6 peace of mind to say, yeah, I have this resource  
7 and it's secure and it's a firm source of supply  
8 and I know it's going to be there for my  
9 customers or my family or whoever, I would  
10 rather have that sooner rather than later.

11 Q. Prior to -- do we know, do you know what the  
12 aquifer levels were before the 1930s drought?

13 A. Before the 1930s drought, in the Equus Beds  
14 Aquifer?

15 Q. Correct.

16 A. Would have been probably pretty close to 100  
17 percent full, and predevelopment, really wasn't  
18 much development, to my knowledge. That's been  
19 referred to as predevelopment, there just wasn't  
20 a lot of demand on the aquifer system.

21 Certainly some but largely leaking out of the  
22 sides as fast as it was getting recharged so ...

23 Q. And in simulating the 1930s drought, you chose  
24 to use a declining aquifer level of 1998 rather  
25 than the full aquifer level we had in the '30s?

1 that. And then water levels kept coming up,  
2 frankly, because of the City's management  
3 practices.

4 So even during that time, some part due to  
5 ASR and other portions due to the City's  
6 management practices of taking much less than, I  
7 believe, around 20,000 acre-feet, or even one of  
8 those years was something on the order of, I  
9 think even near 10,000. So pretty good  
10 recoveries within the Equus Beds Aquifer, which  
11 ultimately limit recharge capacity.

12 Q. So why not model a drought based on a more  
13 current aquifer water level?

14 A. You could.

15 Q. Would that not be prudent to -- as if -- if  
16 we're acting like a drought is imminent but  
17 we're starting our drought modeling at a  
18 situation that nowhere represents the current  
19 situation?

20 A. Well, that's the current situation, knowing  
21 that, again, models and predictions and crystal  
22 balls aren't perfect, and also the assumption  
23 that we would have to essentially pump down and  
24 maintain the aquifer at a lower level in order  
25 to achieve physical recharge capacity.

Page 1055

1 **MS. WENDLING:** I have no further  
 2 questions.  
 3 **PRESIDING OFFICER:** Before we go on,  
 4 since it's been a couple hours, why don't  
 5 we take a quick ten-minute break. You good  
 6 with that?  
 7 **A. No, I just voted for it.**  
 8 **(Thereupon, a recess was taken;**  
 9 **whereupon, the following was had.)**  
 10 **PRESIDING OFFICER:** Okay. We're  
 11 back on the record. And the Intervenor  
 12 just finished cross. Mr. McLeod.  
 13 **MR. MCLEOD:** Thank you.  
 14  
 15 **REDIRECT EXAMINATION**  
 16 **BY MR. MCLEOD:**  
 17 **Q.** I have a little redirect, and I will -- I will  
 18 try to keep it little. Mr. Clement, at times  
 19 during your testimony, both counsel for the  
 20 Intervenor and counsel for the District asked  
 21 you questions about the contingency numbers.  
 22 Was GMD2, the District, were they against the  
 23 idea of having contingency figures with the  
 24 proposal?  
 25 **A. No, not during our collaborative discussion**

Page 1056

1 **period and time that we were meeting with GMD at**  
 2 **the time, I believe we introduced that idea. We**  
 3 **introduced the idea of adding contingency**  
 4 **knowing that the goal of the project was to set**  
 5 **proposed bottoms that were appropriate for the**  
 6 **project, knowing that we are not -- no one has a**  
 7 **crystal ball that is perfect. And I think the**  
 8 **idea may even have come up from GMD2 during that**  
 9 **discussion where we wanted to add enough**  
 10 **contingencies so that we didn't have to revisit**  
 11 **the hearing process and that we felt comfortable**  
 12 **in those bottom numbers.**  
 13 **Q.** So at least the idea, the notion of having some  
 14 contingency was not something that the District  
 15 inherently opposed at that point?  
 16 **A. I think it's possible that either Tim Boese or**  
 17 **DWR during one of those meetings introduced that**  
 18 **concept.**  
 19 **Q.** Now, Mr. Stucky asked you several times about  
 20 different things that you had done working with  
 21 Mr. Boese and working with the District during  
 22 your years at the Groundwater Management  
 23 District. Was any of your work during your time  
 24 at the Groundwater Management District focused  
 25 on aspects of ASR such as setting or resetting

Page 1057

1 the 1993 index level?  
 2 **A. Yes.**  
 3 **Q.** And can you tell us about that in greater  
 4 detail?  
 5 **A. Sure. So I wasn't involved in the original**  
 6 **permitting of the project, either ASR Phase I or**  
 7 **Phase II. My time was -- at GMD was after that.**  
 8 **However, as part of the development of the lower**  
 9 **index levels, one of the things that was**  
 10 **identified is there was a mixup during the**  
 11 **original setting of the levels for both ASR**  
 12 **Phase I and Phase II for the lower index levels,**  
 13 **that there was a mixture of the upper aquifer**  
 14 **levels used and the lower aquifer levels used,**  
 15 **and there was a discrepancy in head difference**  
 16 **at some of those index well locations.**  
 17 **And so at the time, the City, myself being**  
 18 **a GMD staffer, DWR, and I think to some extent**  
 19 **the USGS got together and said, it looks like**  
 20 **there are some discrepancies in these levels,**  
 21 **can we make them uniform and set to the lower**  
 22 **index level? And we also identified that there**  
 23 **might be some additional data from, let's say,**  
 24 **October of 1992, which would have been very**  
 25 **close to 1993 levels of January, and then even**

Page 1058

1 **as late as potentially March of 1993, there**  
 2 **would still be respective or approximating of**  
 3 **the gradient that was 1993.**  
 4 **So during that period, myself at GMD2**  
 5 **reviewed revisions to those water levels. I**  
 6 **believe revisions to those water levels happened**  
 7 **through a findings and order of the chief**  
 8 **engineer after we collaboratively reviewed the**  
 9 **new available information and corrected the,**  
 10 **again, some of those offsets between upper and**  
 11 **lower aquifer at various monitoring wells, index**  
 12 **wells.**  
 13 **Q.** So in terms of the new available information  
 14 that you reference, at that point in time, did  
 15 you have information available for measurements  
 16 taken at index wells?  
 17 **A. No, sir. The index wells did not exist during**  
 18 **1993.**  
 19 **Q.** And the time when you were working on the  
 20 revisions, the 2010 to 2013 time frame, I think  
 21 you indicated you were working with the  
 22 District, did you have any further or helpful  
 23 information from index wells at that point as  
 24 they might relate to the '93 levels?  
 25 **A. Not specifically the index wells themselves. We**

1 did find some, I believe, static measurements  
2 from other City wells, in other words more data  
3 that wasn't included in the original data that  
4 was used back when the project was first  
5 conceived for Phase I. So we had additional  
6 data points to effectively make that groundwater  
7 gradient or our interpretations better  
8 potentially than what was done in the original  
9 interpretation to set the levels back when ASR  
10 Phase I was originally conceived.

11 Q. Without index wells in 1993, how were those  
12 lower index levels determined?

13 A. So we used each one of those points in space  
14 that is an observation point, we brought that  
15 into a program called GIS, or graphical -- or  
16 Geographic Information System. With Geographic  
17 Information Systems, you can use what's called  
18 interpolation, so you build a map based on the  
19 known points.

20 It's reasonable to assume, let's say as an  
21 example just so we can all come to a conclusion  
22 what interpolation is, if you have a point on  
23 the left side that's 10 feet and a point on the  
24 right side that's 5 feet, it's logical to  
25 include -- or conclude that somewhere in between

1 have a multitude of things we can do to improve  
2 on that observed data, but still you're looking  
3 at an error, it's not on observed point. We  
4 think that, thinking back to the data, maybe  
5 plus or minus 2 feet, something of that  
6 magnitude with the interpolated data we had.

7 Q. Moving to something completely unrelated,  
8 Mr. Stucky, last time when we were here in  
9 December asked you kind of an open-ended  
10 question about whether one of the hydrographs or  
11 the summary of the hydrographs showed that of 38  
12 index cells 21 would not get below the 1993  
13 levels, and I think you answered at the time  
14 that that was correct. And I just wanted to ask  
15 you for clarification, is that always correct,  
16 or did you mean that that was correct for the  
17 period of an eight-year drought?

18 A. Ask the question one more time for me.

19 Q. The premise that of the 38 index cells, 21 would  
20 not get below the 1993 levels, a premise that I  
21 think you agreed with, did you mean to confine  
22 that to the model period of the eight-year  
23 drought?

24 A. Yeah, just for that particular simulation. It  
25 doesn't mean that we could necessarily not go

1 those two is a 7 or an 8, that's interpolation.  
2 You're making a guess as to what the gradient is  
3 between those two points, except we do this on a  
4 scale with many, many, many, many points, as  
5 much as we can get that we feel like the data is  
6 accurate.

7 So we made an interpolated map of what we  
8 thought the groundwater gradient was during  
9 January of 1993. And then for the index well  
10 sites which didn't exist, we simply looked up  
11 within the map we made what was the predicted  
12 elevation of the map at that particular location  
13 for the index wells to set the new elevations.  
14 In general, I would anticipate during that  
15 process, which involved DWR, again GMD2, USGS,  
16 multiple reviews, we came up with values that  
17 were, again, maybe plus or minus a few feet,  
18 2 feet, something of that order, we think, based  
19 on the data that we had available.

20 Q. So even in those estimates, there was some  
21 imprecision in pinpointing where those water  
22 levels would have been?

23 A. Absolutely. When doing an inter --  
24 interpolation, it's not perfect, it's a guess on  
25 what's occurring between those two points. We

1 below that value in some other scenario, just  
2 for this particular scenario that we -- that we  
3 modeled.

4 Q. Okay. That may seem like a tiny clarification,  
5 but that seemed to be hanging out there.

6 In the testimony today, Mr. Stucky asked  
7 you questions about the 120,000 acre-foot cap  
8 that is part of the proposal. What is the cap  
9 on accumulation of credits currently?

10 A. None that I know of.

11 Q. And also a series of questions that compared the  
12 proposal to a party filing an application for a  
13 new water right that would need to be perfected.  
14 Is the City seeking an increased allocation  
15 here?

16 A. Not that I believe. Again, the City is bringing  
17 new water to the table. As part of the  
18 proposal, we are capturing transient water from  
19 the Little Arkansas River. In my opinion,  
20 that's why it is not the same as safe yield or  
21 sustainable yield or management of the system or  
22 a new appropriation. It is the City capturing  
23 that water right from surface water. With  
24 respect to a new appropriation of groundwater,  
25 it is not; it is establishing a credit in the

Page 1063

1 **ground that the City built.**  
 2 Q. And to the extent that the District might  
 3 complain that using those credits in future  
 4 periods allows the City to withdraw more than  
 5 its native rights in those periods, don't the  
 6 physical credits already allow the City to do  
 7 that if it can accumulate enough?  
 8 **A. That is correct.**  
 9 Q. Again, a fairly open-ended question in the  
 10 cross-examination today, the posit was whether  
 11 the City could by building more basins or wells  
 12 increase its recharge capacity, and I think you  
 13 agreed that in the abstract that was true. Does  
 14 the usefulness of that and whether that's real  
 15 recharge capacity depend on whether there's a  
 16 place to put the water that we would recharge  
 17 with those wells?  
 18 **A. Yes.**  
 19 Q. There was a series of questions by Mr. Stucky on  
 20 how and whether you had adequately taken into  
 21 account the possible impact of individual  
 22 pumping under multi-year flex plans. Is that  
 23 uncertainty one of the purposes that's addressed  
 24 by the contingency?  
 25 **A. Yes.**

Page 1064

1 Q. You were asked by Mr. Stucky about a series of  
 2 errors several places in the proposal, including  
 3 one error where there was a suggestion that the  
 4 modeling scenario would begin with Cheney 110  
 5 percent full, and particularly Mr. Stucky asked  
 6 you why after Mr. Boese had noticed that error  
 7 and called it to the City's attention and  
 8 Mr. Barfield had also noticed the error and  
 9 called it to the City's attention it was not  
 10 corrected. Does the fact that Mr. Boese noticed  
 11 the error and that Mr. Barfield also noticed the  
 12 error and then your own observation that the  
 13 167,000 acre-foot figure tied to 100 percent  
 14 suggests that that would have been an obvious  
 15 error to anyone such that going through the step  
 16 of formally correcting it was not that  
 17 significant a task?  
 18 **A. Yeah, I think that's accurate based on, I**  
 19 **believe it was figure 2 and the 167,000, to my**  
 20 **knowledge, I believe that's a typo.**  
 21 Q. In each of the instances recited where there  
 22 were errors in tables in the proposal, did those  
 23 errors have any impact on the actual modeling,  
 24 or were they simply errors in stating the  
 25 tabulated results?

Page 1065

1 **A. They were simply errors in stating the tabulated**  
 2 **results. They do not impact the proposed levels**  
 3 **or the modeling results.**  
 4 Q. There was a question asked by Mr. Stucky, I'm  
 5 not sure that I heard it accurately, but I  
 6 thought he asked whether the City was -- was  
 7 saying it would lower aquifer levels to the 1998  
 8 levels to allow for physical recharge and then  
 9 be rewarded with AMCs. I may have misunderstood  
 10 that, but isn't -- isn't the purpose of the AMCs  
 11 to avoid the City needing to actually bring the  
 12 aquifer down to the 1998 levels for physical  
 13 recharge?  
 14 **A. That is the concept, yes.**  
 15 Q. And so one consequence, if the AMCs were  
 16 approved as an element of the City's proposal,  
 17 is the City would not need to make that  
 18 reduction in the aquifer to the 1998 levels to  
 19 get credits, correct?  
 20 **A. Yes, to establish physical recharge capacity,**  
 21 **that would be correct.**  
 22 Q. In terms of whether -- whether in the abstract  
 23 pumping 60,000 feet of credits or 120,000  
 24 acre-feet of credits would have a greater impact  
 25 on the aquifer, you agreed with counsel that

Page 1066

1 pumping the 120,000 acre-feet, if it could be  
 2 done, would have a greater impact on the  
 3 aquifer. To the extent that the City would have  
 4 60,000 acre-feet of credits, or for that matter,  
 5 let's say, 120,000 acre-feet of credits  
 6 accumulated, what does that presuppose, what are  
 7 the only conditions that could have allowed that  
 8 to occur?  
 9 **A. The City would have had to establish those**  
 10 **credits in the first place, either through**  
 11 **physical injection or through the ASR, AMC**  
 12 **proposal. Those credits would have had to exist**  
 13 **for the City to be able to even contemplate**  
 14 **taking them.**  
 15 Q. And in each case, meaning that in an earlier  
 16 period the City either put or left an equivalent  
 17 amount of water, acre-feet of water in the  
 18 aquifer, correct?  
 19 **A. Correct.**  
 20 Q. Ms. Wendling asked you about the contrast  
 21 between the example operational report and the  
 22 proposal for the year 2016 and the accounting  
 23 report figures that we show for the year 2016 in  
 24 terms of the 3,000 or so acre-feet recharged by  
 25 City wells in 2016 shown by the accounting

1 report. If you would turn to section 2.2 of the  
2 accounting report for that year, I think that's  
3 page 2-1 of that report.  
4 **A. I have arrived at page 2-1.**  
5 Q. In the section quantity of water available, what  
6 does that reflect about the number of days  
7 during 2016 that the Phase I wells and the Phase  
8 II wells could operate consistent with their  
9 permit conditions?  
10 **A. I'm going to read directly from what looks like**  
11 **Exhibit 75 on page 2-1, the quantity of water**  
12 available, section 2.2: Based on the daily  
13 average flow data from the U.S. Geological  
14 Survey, Highway 50 gage, streamflow exceeded the  
15 minimum limit for Phase I diversion and recharge  
16 operations a total of 167 days in 2016. Based  
17 on the daily average flow data from the USGS  
18 Valley Center gage, streamflow exceeded the  
19 minimum permit limit for Phase II diversion and  
20 recharge operations a total of 232 days during  
21 calendar year 2016.  
22 Q. And going on to the next page, what does the  
23 carry-over part of that paragraph tell us about  
24 the number of days they were actually able to  
25 operate the Phase II system during 2016?

1 **A. It looks like in the last -- well, this would be**  
2 **at the top of the page, last sentence, during**  
3 **the operational season from April 15th to**  
4 **October 15th, all of these operational**  
5 **considerations were met and the Phase II system**  
6 **was operated a total of 129 days in 2016.**  
7 Q. So then when we look back at table 2.2, that  
8 3,026.94 acre-feet of recharge by the Phase I  
9 and Phase II wells, that's spread over the  
10 entire accounting year, correct?  
11 **A. Yes.**  
12 Q. And can you -- this may be something you can't  
13 do without a calculator, but can you ballpark  
14 for us for the wells that are actually operating  
15 there, contributing to that recharge, what did  
16 each -- what did each well on the average  
17 actually manage to contribute, if you divided  
18 that recharge by the wells that are  
19 participating?  
20 **A. Well, I don't have a calculator in front of me,**  
21 **but the way you would approach that as a**  
22 **comparison would be to divide the acre-feet by**  
23 **the total number of operational days available,**  
24 **in this case we just discussed 129, I believe,**  
25 **and divide those essentially to get -- and then**

1 **apply the conversion from acre-feet to gallons**  
2 **to get a rate that would be understandable.**  
3 Q. And that would -- the 129 days would encompass  
4 Phase II, which when you look at the recharge  
5 figures, most of the well recharge is coming  
6 from the Phase II wells, correct?  
7 **A. That appears to be the case. There is a small**  
8 **amount of recharge to the Phase I wells, but**  
9 **relative to the 3,000 number, it is very small.**  
10 **MR. MCLEOD:** I don't have further  
11 questions for the witness. I would say  
12 that after the District's and Intervenor's  
13 experts testify we reserve the right to  
14 bring this witness back in rebuttal, if  
15 need be.  
16 **PRESIDING OFFICER:** Mr. Oleen.  
17 **MR. OLEEN:** One line of questioning.  
18  
19 **RE CROSS EXAMINATION**  
20 **BY MR. OLEEN:**  
21 Q. Mr. Clement, I want to go back to a question  
22 that I think you asked -- or answered a couple  
23 times, but most recently you were asked by  
24 Mr. McLeod whether there -- under the current  
25 ASR Phase II permits, whether, to your

1 knowledge, there's any condition that limits or  
2 puts a cap on the total number of recharge  
3 credits that Wichita can accumulate. Do you  
4 remember that question?  
5 **A. Yes.**  
6 Q. And your answer was no, correct?  
7 **A. There is not currently a permit condition that**  
8 **would cap the amount of recharge credits that**  
9 **could be accrued on the City's permits, to my**  
10 **knowledge.**  
11 Q. So just to be clear, then, and follow the  
12 implications of that answer, assuming that the  
13 City operates in compliance -- assuming -- let  
14 me start over, please. Assume we stay under the  
15 current ASR Phase II permits and their  
16 conditions, assuming the City operates in  
17 compliance with those permit conditions and  
18 otherwise operates in compliance with applicable  
19 water laws, could the City conceivably over a  
20 certain period of time accumulate 250,000  
21 recharge credits? Or 200,000 or 300,000?  
22 **A. I mean, under the existing permit conditions,**  
23 **there is no cap. I don't know if I could speak**  
24 **to the hydrogeologic capacity of the system to**  
25 **hold that many credits under a hypothetical**

Page 1071

1 **simulation without doing, you know, some math**  
 2 **and modeling, but, I mean, under the existing**  
 3 **permit conditions, certainly the City could if**  
 4 **they had the capacity to and wanted to.**  
 5 Q. And the proposed 120,000 cap that the City is  
 6 proposing as part of their AMC accounting  
 7 request, that is something that Wichita  
 8 voluntarily proposed; is that true?  
 9 **A. Yes.**  
 10 Q. If as a result of the chief engineer's final  
 11 determination, let's assume the concept of AMCs,  
 12 the accounting concept is not approved, but  
 13 let's assume that the other main concept of this  
 14 proposal, lowering the minimum index cell  
 15 levels, or, quote, the bottoms, let's assume  
 16 that that portion is approved by the chief  
 17 engineer, is it your understanding that as the  
 18 proposal is offered, there would not be the  
 19 120,000 acre-foot cap if only the minimum index  
 20 cell level request portion of the proposal were  
 21 approved?  
 22 **A. I think that's consistent with what we have in**  
 23 **the proposal. If we are stuck or bound to the**  
 24 **current accounting process and physical ASR**  
 25 **recharge, then the accounting process, I think,**

Page 1072

1 **covers how those credits would be accumulated.**  
 2 **I think you would have to ask the owner of the**  
 3 **project for their opinion on whether that permit**  
 4 **condition would apply or not. It's not a permit**  
 5 **condition right now, if we're stuck with**  
 6 **physical recharge capacity as the only means to**  
 7 **do that. I don't know that 120,000 either way,**  
 8 **I'm not the owner of the project, so I can't**  
 9 **speak to that permit condition. If that answers**  
 10 **the question.**  
 11 **MR. OLEEN:** Thank you, no further  
 12 questions.  
 13 **PRESIDING OFFICER:** Mr. Stucky.  
 14  
 15 **RE CROSS EXAMINATION**  
 16 **BY MR. STUCKY:**  
 17 Q. Just a handful of quick questions. First of  
 18 all, Mr. Clement, can you point me to the  
 19 written document, whether it be an email or a  
 20 letter, that exists that tells us that the  
 21 District or Mr. Boese introduced the concept of  
 22 a contingency?  
 23 **A. No, the best I have is my memory during those**  
 24 **meetings. That's the best I have, at least in**  
 25 **my personal records that I know of is my memory.**

Page 1073

1 Q. With respect to table 2-5, it shows that the  
 2 conservation pool of Cheney increases during the  
 3 drought. Is that a true statement as far as  
 4 what we show in table 2-5, if you look in that  
 5 second-to-last row, it shows that in certain  
 6 years it identifies that a conservation pool  
 7 would actually increase during certain years of  
 8 the drought. Is that a true statement?  
 9 **A. That's accurate.**  
 10 Q. So would that suggest that there is water, then,  
 11 flowing into Cheney Reservoir, at least during  
 12 some years of the drought?  
 13 **A. Yeah, sure.**  
 14 Q. So if in this modeling we are showing that some  
 15 water flowed into Cheney Reservoir during this  
 16 model drought, why would there not also be water  
 17 flowing into the river during this model  
 18 drought?  
 19 **A. There is -- which model -- what are you**  
 20 **referring to?**  
 21 Q. Well, if we replicate years 2011 and 2012 over  
 22 the course of eight years, we learn that the  
 23 minimum desirable streamflow would remain the  
 24 same, so my question is that if the conservation  
 25 pool in Cheney Reservoir is increasing during

Page 1074

1 this simulated drought, shouldn't there also be  
 2 changes in the river flow that are more  
 3 significant than just based on replicating 2011  
 4 and 2012 over the course of eight years?  
 5 **A. Okay, thank you, you specified which model we**  
 6 **were talking about so I can -- I can answer to**  
 7 **the Equus Beds groundwater model which I think**  
 8 **you're referring to.**  
 9 **From a standpoint of, again, reviewing what**  
 10 **is a reasonable bottom for the project, we could**  
 11 **try and emulate a specific event or flow event,**  
 12 **we could try and target that. The purpose of**  
 13 **looking at sustained drought levels, and I**  
 14 **believe as you even previously asked in some**  
 15 **other questions, is don't we anticipate it to**  
 16 **continue to be actually drier? In my**  
 17 **experience, with this system being very much**  
 18 **affected by groundwater pumping, there is an**  
 19 **interrelationship between river flows and**  
 20 **groundwater with both rivers. We wanted to**  
 21 **acknowledge the fact that we think we should be**  
 22 **more conservative in planning for drier**  
 23 **conditions, not necessarily one event that is**  
 24 **like a refill event in Cheney. In reality, I**  
 25 **think it would be just -- just as prudent**

1 planning and maybe perhaps more accurate to  
2 continue the river flows as we did in 2011 and  
3 2012, sustained low flow conditions for a  
4 conservative estimate of what could happen  
5 during 1 percent drought.

6 Q. And just to sum up, although it's possible there  
7 could be some flow into the rivers during this  
8 modeled drought or the river could dry up,  
9 neither of those situations was accounted for  
10 because the idea of replicating 2011 and 2012  
11 was what you perceived as the best fit; is that  
12 right?

13 A. That's correct. If you talk to three different  
14 modelers on the same day about how they approach  
15 a situation, generally you're going to get a  
16 slightly different answer, that's just the  
17 nature of modeling.

18 Q. With respect to figure 14, why are the recharge  
19 basins not included in the numbers shown in  
20 figure 14?

21 A. Let me flip to that real quick for you. What  
22 page is that on again?

23 Q. It is on --

24 A. 3-12, I found it.

25 Q. Yeah, page 3-12.

1 keep in mind that the City has to take that at a  
2 later point in time. If we, as an example,  
3 targeted recharge basin 1 and recharge basin 2  
4 as targets for the water supply component of  
5 this, as the drought component of this, then we  
6 would also have to take water during times of  
7 drought from that area. And being critical, as  
8 the City said, and one of its management goals  
9 is to continue ASR Phase I in its role as a  
10 water quality protection system, more so than a  
11 drought mitigation system; in other words, if we  
12 put water at recharge basin 2 or recharge basin  
13 1, we've got to pull it back out of the ground  
14 if its role is water supply. So that's why we  
15 didn't count those three basins of the system.

16 Q. Can Phase II recharge water be put into recharge  
17 basin 2?

18 A. Sure, the piping is there to do that.

19 MR. STUCKY: Finally just as, I  
20 guess, a housekeeping matter, I think at  
21 least two of the parties discussed the  
22 District's Exhibit 75, so I'm just going to  
23 go ahead and formally move to admit the  
24 District's Exhibit 75.

25 PRESIDING OFFICER: Any objection?

1 A. So currently from an operations standpoint, if  
2 you are the City of Wichita, let's put ourselves  
3 in their shoes for just a moment, your job, your  
4 goal is to build water supply for your customers  
5 for that drought demand using ASR credits. We  
6 have available to us currently recharge basin 1,  
7 recharge basin 2, and recharge basin 36.

8 The geographic location of those basins is  
9 very important for the discussion today.

10 Recharge basins 1 and 2 are located in Phase I,  
11 which as we discussed had some water quality  
12 protection components in those areas. The other  
13 aspect of that would be recharge basin 36, which  
14 I believe we previously discussed. The water  
15 injected at those locations does not stay there  
16 very long simply because we are very close to  
17 the river and things generally are maintained at  
18 fuller conditions. So it doesn't benefit either  
19 the City or other water users to have recharge  
20 basin 36 continue to be recharged only to see  
21 that water simply pushed back out to the Little  
22 Arkansas River, there's just not a net benefit  
23 from doing that.

24 Conversely, putting water at a location for  
25 the purpose of building drought water supply,

1 MR. OLEEN: May I just have a moment  
2 to look at this --

3 PRESIDING OFFICER: Sure.

4 MR. OLEEN: -- Exhibit Number 75?  
5 If I could ask for some clarification from  
6 Mr. Stucky, my tab GMD2 binder Number 75  
7 begins with a letter dated April 11, 2019?

8 MR. STUCKY: Yeah, that's correct.  
9 It's an accounting report, and there's a  
10 introductory letter, I think, regarding  
11 that accounting report.

12 MR. OLEEN: Okay. And I just wanted  
13 to be clear whether that introductory  
14 letter was part of what you're proffering?

15 MR. STUCKY: Yes.

16 MR. OLEEN: Okay. No objection.

17 PRESIDING OFFICER: Exhibit GMD  
18 Exhibit 75 will be admitted.  
19 (GMD Exhibit Number 75 Marked for  
20 Identification.)

21 PRESIDING OFFICER: Ms. Wendling.

22  
23 RE CROSS EXAMINATION

24 BY MS. WENDLING:

25 Q. I believe Mr. Stucky just asked you about figure

Page 1079

1 14 and recharge basin 36, and you said it's not  
 2 included because there's no net benefit to using  
 3 recharge basin 36 based on its location?  
 4 **A. I wouldn't say zero net benefit, but if you look**  
 5 **at -- put yourself in the shoes of a**  
 6 **municipality trying to build drought resiliency,**  
 7 **you're going to want to put water where you can**  
 8 **actually recover it long-term and where it has**  
 9 **the best retention rates. And for the City,**  
 10 **that's largely in the core of the well field,**  
 11 **not necessarily in the fringes.**  
 12 **RB36 is on the easternmost side of the well**  
 13 **field, so when we put water there, it's a great**  
 14 **wide spot in the road to put water, but the**  
 15 **retention rate of that water is relatively low,**  
 16 **especially during high groundwater conditions**  
 17 **that we have now. And there's only a number of**  
 18 **wells in that location that could actually go**  
 19 **and actually recover those credits. So it's**  
 20 **just not a strategic advantage point for either**  
 21 **the City or really a water level benefit for**  
 22 **others to continue to put recharge to basin 36,**  
 23 **at least from a holistic standpoint that we'd be**  
 24 **forced to put it there under an operational**  
 25 **plan, where we could actually put it to**

Page 1080

1 **beneficial use in another location.**  
 2 Q. So are you proposing that recharge basin 36  
 3 would continue to be used?  
 4 **A. Sure, I think it's an opportunity to put water**  
 5 **there; it's just at its capacity, if we biased**  
 6 **at a -- let's say recharge basin 36 has 15 MGD**  
 7 **of capacity. Under an operations plan, well, we**  
 8 **have that capacity, why don't you guys just put**  
 9 **it there? Strategically, it just wouldn't make**  
 10 **sense, it wouldn't provide a benefit to the City**  
 11 **to put that much water in that single location**  
 12 **versus where we actually need it for drought**  
 13 **supply and, frankly, where water level**  
 14 **recoveries in other locations could be more much**  
 15 **beneficial.**  
 16 Q. Okay. So basin 36 would not be used in  
 17 calculating your physical recharge capacity for  
 18 purposes of the AMC accounting?  
 19 **A. Not under the current draft, no.**  
 20 **MS. WENDLING:** Okay, thank you.  
 21 **PRESIDING OFFICER:** Any more  
 22 questions for Mr. Clement? Hearing none,  
 23 you may be excused but you have been  
 24 reserved for rebuttal. Mr. McLeod.  
 25 **MR. MCLEOD:** City next calls

Page 1081

1 Mr. Paul McCormick.  
 2  
 3 PAUL ANDREW MCCORMICK,  
 4 having been first duly sworn, was  
 5 examined and testified as follows:  
 6  
 7 **DIRECT EXAMINATION**  
 8 **BY MR. MCLEOD:**  
 9 Q. Please state your name for the record.  
 10 **A. Paul Andrew McCormick.**  
 11 Q. Mr. McCormick, give us a little bit of  
 12 information on your educational background and  
 13 any degrees you hold.  
 14 **A. I have a bachelor's in science and geological**  
 15 **engineering from the University of Missouri at**  
 16 **Rolla.**  
 17 Q. Any professional licenses or registrations?  
 18 **A. I'm a licensed professional engineer in Iowa,**  
 19 **South Dakota, Nebraska, Missouri, and Kansas.**  
 20 Q. In the green notebook, which is under the purple  
 21 notebook in front of you, and last among the  
 22 group of documents behind the tab expert  
 23 reports.  
 24 **A. Okay.**  
 25 Q. Is there a document in there that you recognize

Page 1082

1 as your resume or CV?  
 2 **A. I'm looking. Yes.**  
 3 Q. I'm going to hand the reporter a copy of the  
 4 document to mark as City 28, I believe.  
 5 (City Exhibit Number 28 Marked for  
 6 Identification.)  
 7 **PRESIDING OFFICER:** I'm sorry, I'm  
 8 trying to find where that is in the binder.  
 9 **MR. MCLEOD:** If I may approach the  
 10 hearing officer --  
 11 **PRESIDING OFFICER:** Yes, absolutely.  
 12 **MR. MCLEOD:** -- I will try to help  
 13 with that.  
 14 **PRESIDING OFFICER:** Thank you.  
 15 **BY MR. MCLEOD:**  
 16 Q. Mr. McCormick, did you have some personal  
 17 involvement in the preparation of this document?  
 18 **A. Yes, I did.**  
 19 Q. And, generally, is the subject matter set forth  
 20 herein -- well, let me start with this:  
 21 Approximately what date did you prepare the  
 22 document?  
 23 **A. The CV?**  
 24 Q. Yes.  
 25 **A. This is our file, what we call our long form CV,**

1 so it has been on file for a while. Based on  
2 the years there, it was about a year and a half,  
3 two years ago.

4 Q. Okay. And as of the time that you prepared it,  
5 was it an accurate reflection of your experience  
6 to that date?

7 A. It includes the major projects that I have  
8 worked on. There are many others that are not  
9 on here.

10 Q. And since the date that it was prepared, have  
11 there been significant new projects you were  
12 involved in that would have bearing on this  
13 case?

14 A. Maybe three or four, something like that.

15 Q. Can you tell us about those?

16 A. Yeah, we've developed a new groundwater model  
17 for the City of West Des Moines, Iowa,  
18 developing a new 15 MGD well field for them. I  
19 developed another groundwater model for an  
20 industrial client near the Mississippi River  
21 in -- over by St. Louis. I've done - yeah,  
22 that's in there - additional model review in  
23 Nebraska on the Platte well field model up  
24 there. And that's probably about it since this  
25 resume came out.

1 that drought period.

2 Q. And when you say the existing model, are you  
3 referring to the USGS developed model?

4 A. Yes, the Equus Beds groundwater model.

5 Q. In the course of your work with that model, did  
6 you also use a program called Groundwater  
7 Vistas?

8 A. Yes.

9 Q. And what did that entail?

10 A. Groundwater Vistas is a graphical user interface  
11 that allows -- it just makes it easier to input  
12 and output data from the MODFLOW package. It  
13 gives a graphical interface that you can see a  
14 map and look at what you're -- you're actually  
15 working on rather than just lines and lines and  
16 lines of numbers.

17 Q. So, essentially, it's not changing the  
18 substance, but it's helping to make the model  
19 more user friendly?

20 A. Correct.

21 Q. How did you modify the Equus Beds groundwater  
22 model to evaluate a 1 percent drought event?

23 A. As we talked about, we used the 2011 and 2012  
24 hydrologic conditions repeated for eight years.

25 Q. If the model duration is ten years, what are the

1 MR. MCLEOD: Okay. I will offer the  
2 resume as Exhibit -- City Exhibit 28.

3 PRESIDING OFFICER: Any objections?

4 MR. STUCKY: (Shakes head.)

5 PRESIDING OFFICER: City 28 will be  
6 admitted.

7 BY MR. MCLEOD:

8 Q. Mr. McCormick, what was your role in relation to  
9 the preparation and submission of the City's  
10 proposal that's at issue in this hearing?

11 A. I conducted the modeling and sat in on concept  
12 development and provided input throughout the  
13 process, and that's probably it.

14 Q. Did you have prior experience with the model  
15 that was used for drought modeling in this case?

16 A. Yes.

17 Q. How was the MODFLOW groundwater flow model used  
18 for the drought modeling developed in this case?

19 A. As has been described, we took the existing  
20 model and repeated the 2011, 2012 hydrologic  
21 conditions for eight years and then added two  
22 years of the hydrologic conditions from 2010  
23 onto the end of it, and we ran that model to  
24 forecast what the water levels would be after --  
25 or the lowest water levels that we'd see during

1 other two years in the model?

2 A. Those are considered normal, a normal year,  
3 denoting the end of the drought and back into  
4 more typical conditions.

5 Q. I think you were present during Mr. Clement's  
6 testimony, and he had recalled that including  
7 those years was somewhat of a collaborative  
8 decision. Is your recollection consistent with  
9 that?

10 A. Yes.

11 Q. In your experience, Mr. McCormick, how widely  
12 used is MODFLOW software for simulations and  
13 predictions concerning groundwater conditions?

14 A. MODFLOW is the industry standard for groundwater  
15 modeling. It is the most accepted and used  
16 modeling software out there.

17 Q. In connection with the ASR project, is that same  
18 model used for any other purpose by the  
19 Groundwater Management District and the City?

20 A. We do the annual accounting with it.

21 Q. How many years has that been true?

22 A. Since the model -- we have always used an Equus  
23 Beds model. The older one that was developed by  
24 Nathan Myers was used until this model was  
25 developed. When this model was developed, we

Page 1087

1 reran all years that the ASR system has been  
 2 operating to compare the results and -- so it  
 3 has evaluated every year that the ASR system has  
 4 been in operation.  
 5 Q. And how close were those results between the two  
 6 models?  
 7 A. I don't have those exact figures to tell you an  
 8 exact error or anything between the two, but  
 9 they were -- they were reasonably close. They  
 10 were within the ballpark that you would ...  
 11 Q. Do you recall, did the chief engineer make any  
 12 retrospective changes based on the new model, or  
 13 was it just a comparison simply for purposes of  
 14 testing the new model against the old?  
 15 A. It was for comparison.  
 16 Q. Counsel asked Mr. Clement, who didn't know the  
 17 answer to this question and so I'm going to see  
 18 if you do, as to whether the 1998 water levels  
 19 represent an average of 91 percent saturation  
 20 across the model cells, do you know if that's  
 21 true or not?  
 22 A. I believe that is what we calculated, yes.  
 23 Q. Does the model account for pumping recharge,  
 24 streamflow, evapotranspiration, and groundwater  
 25 migration?

Page 1088

1 A. Yes.  
 2 Q. In your opinion, does the model reproduce the  
 3 water level changes in the aquifer to an  
 4 acceptable level of accuracy within the basin  
 5 storage area?  
 6 A. Yes.  
 7 Q. During Mr. Clement's testimony, we looked  
 8 briefly at figure 10, which is part of the  
 9 proposal in the black binder.  
 10 A. Do you happen to know the page number?  
 11 Q. I'm going to say 2-22.  
 12 A. Good memory. Okay, I'm looking at it.  
 13 Q. And can you just walk us through that graphic  
 14 and explain what it's depicting?  
 15 A. It is depicting the water levels at the end of  
 16 the eight-year period of drought, so at the end  
 17 of stress period eight in the model. It's  
 18 giving the index well or index cell number, the  
 19 average remaining saturated aquifer thickness,  
 20 and the -- in feet, and the average aquifer  
 21 condition in a percentage.  
 22 Q. Okay. So this would be -- this would be at the  
 23 close of the last drought stress period but  
 24 before the two years of recovery?  
 25 A. That is correct.

Page 1089

1 Q. Turning to the subject of ASR accounting, you've  
 2 alluded to the use of the groundwater model in  
 3 that accounting process. Can you describe for  
 4 us how the current ASR physical recharge credit  
 5 accounting process works?  
 6 A. Currently we do two runs of the model. The  
 7 first run does not include any of the ASR  
 8 recharge, the diversion wells pumping, nothing  
 9 put into the recharge basins. Basically what  
 10 would happen if the ASR project did not exist.  
 11 Then we rerun it with all of the inputs for each  
 12 of those things added, so the recharge going  
 13 into the basins, into the wells, diversion  
 14 pumping from the diversion wells, and then we do  
 15 a comparative analysis of the water levels in  
 16 the two, and that tells us the flux between  
 17 these index cells. It allows us to calculate  
 18 the flux between each of those cells and  
 19 determine where the water was moved to due to  
 20 the ASR operations. Since the only change is  
 21 the ASR operations, all of the differences in  
 22 the model are caused by ASR.  
 23 Q. So in a sense, it's as though you take a  
 24 snapshot of the year without ASR and then a  
 25 second with ASR, and you compare the two to

Page 1090

1 identify the effects of ASR for the year?  
 2 A. Yes, that's a good -- good analogy.  
 3 Q. Included in the process, you have factors for  
 4 water leaking out of the aquifer into the  
 5 adjacent rivers?  
 6 A. Yes.  
 7 Q. And factors that address the movement or  
 8 migration of water between index cells?  
 9 A. Yes. It also accounts for movements out of the  
 10 basin storage area and on through the aquifer in  
 11 other parts of the model.  
 12 Q. And we need to do that because not all of the  
 13 water we inject stays in the basin storage area,  
 14 correct?  
 15 A. That is correct.  
 16 Q. What percentage on average has been retained in  
 17 the basin storage area during the period of time  
 18 the ASR system has been in operation?  
 19 A. I believe it's between 80 and 85 percent.  
 20 Q. Are the losses uniform across the basin storage  
 21 area, or do they vary geographically?  
 22 A. They vary geographically. The groundwater  
 23 gradient and flow is from west to east. So  
 24 water that is put in on the east side of the  
 25 basin storage area basically has nowhere to go

1 but flow out; it either flows out to the Little  
2 Ark River or out into the aquifer outside the  
3 basin storage area, if it's not used within the  
4 storage area. Water injected or recharged on  
5 the west side of the basin storage area is held  
6 back by downstream injection and moves more  
7 slowly into other cells.  
8 Q. If you would go to figure 15 in the proposal.  
9 A. Okay.  
10 Q. Walk us through what that graphic is depicting.  
11 A. This is the proposed AMC annual recurring credit  
12 loss. The cells in blue are -- would be a 1  
13 percent annual loss, the cells in green would be  
14 a 3 percent annual loss, and the cells in orange  
15 would be a 5 percent loss. And that's  
16 reflective of that gradient in the flow to the  
17 east, with a greater loss the farther the water  
18 moves to the east.  
19 Q. Okay. Let me back up a little bit and ask you a  
20 few more questions about the physical recharge  
21 credits. How often is the accounting process  
22 for physical recharge credits done?  
23 A. Annually.  
24 Q. And what time of year generally?  
25 A. The report is generally due August 1st, it

1 the State?  
2 A. Yes, I submit copies to DWR and GMD  
3 simultaneously.  
4 Q. And do they then have an opportunity to review,  
5 and by they I mean the District, does the  
6 District then have an opportunity to review the  
7 report and offer their own comments to the  
8 State?  
9 A. Yes, they do.  
10 Q. With the proposed aquifer maintenance credits  
11 where we -- where we don't have injection of  
12 physical recharge, how does the proposed  
13 accounting procedure for the AMCs differ from  
14 the physical recharge credit accounting method?  
15 A. As we talked about with the two snapshots, the  
16 physical recharge, we know where it went in the  
17 ground, we know what wells it went in, we have  
18 meters telling us how much went in the ground.  
19 Obviously we can't do that with AMCs because  
20 they never actually went in the ground.  
21 So the proposed accounting method  
22 distributes them amongst the operating wells  
23 that year, the -- the wells that the City of  
24 Wichita actually had in operation. If a well is  
25 down for maintenance, is not operating for the

1 generally gets delayed; there's a lot of data  
2 that has to be compiled for that, and until we  
3 get that data, we can't do anything with it. So  
4 there's a whole process of getting that. It's  
5 usually in the fall of the following year, so  
6 the 2016 report that was referenced earlier was  
7 turned in in the fall of 2017. So there's about  
8 a year delay time.  
9 Q. When a calendar year ends --  
10 A. Uh-huh.  
11 Q. -- the first step would be that you need to  
12 gather the data necessary to run the model --  
13 A. Uh-huh.  
14 Q. -- with and without ASR for that year? What  
15 sort of data needs to be rounded up for that?  
16 A. We need precipitation data, the  
17 evapotranspiration calculations, streamflow  
18 data, and then the big component is the pumping  
19 data from the DWR.  
20 Q. And all of that you need for the entire calendar  
21 year that you're evaluating?  
22 A. That's correct.  
23 Q. When you have run the model and prepared the  
24 report, does it go to the Groundwater Management  
25 District for review and comment when it goes to

1 year, then that would not get included in that.  
2 But the amount that is withdrawn and is eligible  
3 for AMCs is distributed evenly across those  
4 wells as if it had been injected. And then  
5 the -- there's a 5 percent annual loss taken  
6 from that, and then moving forward, the  
7 recurring loss would be taken from that.  
8 Q. Okay. And that brings us back to the figure 15  
9 we were looking at, and my question is how do  
10 you then come up with that figure 15 imputing a  
11 leakage to the aquifer maintenance credits?  
12 A. That was a long process to come up with that.  
13 We'd been talking for a number of years, and  
14 Mr. Boese and DWR and the City and Burns & Mac  
15 had all hoped to find a simpler method so that  
16 we could understand our accounting a little  
17 better. And just to make this process faster,  
18 easier, less expensive, and easier for others to  
19 look at and determine where things went.  
20 Through collaborative discussions, we had  
21 talked about a percentage loss along these  
22 lines, so we went in and we determined if we had  
23 a hole pumped in the aquifer to put water into  
24 and we could inject 30 million gallons a day,  
25 how much water do we retain? We retain 95

Page 1095

1 percent of that water. So to accommodate that,  
 2 we came up with a automatic annual loss of 5  
 3 percent.  
 4 Then we looked at varying percentages  
 5 across the well field in this sort of  
 6 arrangement but looking from starting with 3, 5,  
 7 and 10, different combinations of that, and we  
 8 plotted that against the actual physical  
 9 recharge history that we had. And if you look  
 10 at figure 16 of the report, we found that the 5  
 11 percent loss with the 1, 3, and 5 annual, which  
 12 averages out to a 3 percent annual, closely  
 13 matched what we see in our history with the  
 14 physical recharge credits.  
 15 Q. Okay. Let's go to that figure 16 on the table  
 16 4-2. So if I understand what you're saying, you  
 17 essentially took the knowledge that you had of  
 18 leakage demonstrated by the physical credits and  
 19 you imputed a like loss to the AMCs?  
 20 **A. That is correct.**  
 21 Q. Is there a relationship between water levels in  
 22 the aquifer and the degree of physical losses?  
 23 **A. Yes.**  
 24 Q. And what is that relationship?  
 25 **A. The physical losses increase the higher the**

Page 1096

1 **water levels go.**  
 2 Q. Explain to us what we're seeing in figure 16 in  
 3 terms of the two lines that are plotted on this  
 4 graph, what does each of those lines represent?  
 5 **A. The blue line is the plotted line of the actual**  
 6 **cumulative physical recharge credit number; and**  
 7 **the green line is the same -- uses -- is the**  
 8 **proposed AMC method, and we use the actual**  
 9 **injected amounts that we had physically**  
 10 **injected. We recalculated using the AMC method**  
 11 **for comparison so we'd have the same numbers,**  
 12 **amount of water going into the ground or being**  
 13 **accounted for as AMCs. So the blue line that's**  
 14 **shown there is the current physical accounting**  
 15 **process, and the green line is the proposed AMC**  
 16 **accounting process.**  
 17 Q. Based on the same quantities as the physical --  
 18 **A. Based on the same quantities, yes.**  
 19 Q. It appears that the trends follow very closely  
 20 in the early years but diverge more in the later  
 21 years, why is that?  
 22 **A. Most of that is caused by the higher levels**  
 23 **limiting our ability to put water into the**  
 24 **wells. So more water was diverted to the**  
 25 **recharge basins, specifically recharge basin 36.**

Page 1097

1 **Recharge basin 36 being near the Little Ark and**  
 2 **in the far south area has a substantial loss of**  
 3 **physical recharge. Most of that water flows**  
 4 **away on the order of 50 to 60 percent.**  
 5 Q. Mr. McCormick, what's the -- what's the point of  
 6 the AMCs as an alternative accounting method,  
 7 what benefit does that bring to users of the  
 8 aquifer or the City?  
 9 **A. It keeps the aquifer full. If we don't have to**  
 10 **pump down -- and higher water levels benefit**  
 11 **every user of the aquifer. So if the aquifer is**  
 12 **kept full, then every person using water from**  
 13 **that aquifer is seeing a benefit from it,**  
 14 **whether it's an electrical pumping cost, water**  
 15 **availability, or any hydrogeologic effect from**  
 16 **lowered water levels.**  
 17 Q. There were a few other questions that  
 18 Mr. Clement didn't know the answer to and you  
 19 may or may not, but if you don't, that's fine.  
 20 Counsel asked Mr. Clement how long it would take  
 21 the City to -- or maybe it might have actually  
 22 been Ms. Wendling, one of counsel asked  
 23 Mr. Clement how long it would take the City to  
 24 pump water levels in the aquifer down to the  
 25 1998 levels. Have you done any projections on

Page 1098

1 that?  
 2 **A. No, not directly targeting that level. And**  
 3 **there's a lot of factors that would weigh into**  
 4 **that as far as how much the City is pumping, how**  
 5 **much surrounding wells are pumping, irrigators**  
 6 **and industry, that sort of thing. And, of**  
 7 **course, what the weather conditions were, how**  
 8 **much natural recharge is entering the aquifer.**  
 9 Q. Do you know whether the City's -- the City's  
 10 treatment plant and blending requirements also  
 11 impact its ability to take water from the  
 12 aquifer as opposed to Cheney?  
 13 **A. That is not my area of expertise, but from**  
 14 **conversations that I have been a part of, I have**  
 15 **heard that said many times by people who that is**  
 16 **their expert -- area of expertise.**  
 17 **MR. MCLEOD:** I don't have further  
 18 questions for the witness.  
 19 **PRESIDING OFFICER:** Mr. Oleen.  
 20  
 21 **CROSS-EXAMINATION**  
 22 **BY MR. OLEEN:**  
 23 Q. Mr. McCormick, have you heard some -- have you  
 24 been here for the entirety of these proceedings  
 25 when they began back in December?

1 **A. No, I have not been here for the entire**  
2 **proceedings.**  
3 Q. Okay. Well, tell me, did you hear some  
4 discussion about under the current ASR Phase II  
5 permit conditions, when the aquifer is  
6 practically full and there isn't room in order  
7 to inject excess Little Ark River flows in order  
8 to accumulate recharge credits that this -- that  
9 type of situation essentially forces the City to  
10 pump space, create space in the aquifer by  
11 withdrawing water therefrom in order to create  
12 sufficient space in order to inject excess river  
13 flows and therefore create recharge credits?  
14 Have you heard that?  
15 **A. Yes, I've heard quite a bit of that, and it's**  
16 **correct, if the bucket's already full, you have**  
17 **to pull something out of it to put more into it.**  
18 Q. I want to know, is there -- is it better in  
19 terms of decreased risk to water quality to  
20 leave a body of water in situ, or in place,  
21 leave it alone, versus to disturb it by  
22 withdrawing a portion of it and then injecting a  
23 portion back into it? And what I -- so what I  
24 mean by this question, then, is given what you  
25 just said you heard about what the City would

1 it's outside the scope of his expert  
2 report. There's no -- there's no opinions  
3 rendered with respect to the City's -- the  
4 effect of the City's proposal on water  
5 quality in this expert's report.  
6 **MR. OLEEN:** May I have a moment to  
7 pull up that report?  
8 **PRESIDING OFFICER:** Sure.  
9 **MR. OLEEN:** Madam Presiding Officer,  
10 Mr. Stucky is correct in that I don't see  
11 some express recitation in Mr. McCormick's  
12 submitted expert report that I just very  
13 briefly skimmed, I don't see an exact  
14 representation of what he's currently  
15 testifying to, but it's Mr. McCormick's  
16 professional stamp and signature on this  
17 ASR permit modification proposal that  
18 we're -- that we're here today discussing,  
19 and one of the explanations for why the  
20 City has said that this new accounting  
21 concept is beneficial, as I understand it,  
22 is that it would negate the need to, quote,  
23 pump the hole in the aquifer and create  
24 space in which to physically inject water  
25 to create recharge credits under the

1 have to do in order to create space in the  
2 aquifer in order to inject more water therein,  
3 that's one option to generate recharge credits,  
4 correct?  
5 **A. Yes.**  
6 Q. Under the City's accounting, proposed AMC  
7 accounting concept, that sort of withdrawal  
8 would not need to occur in order to create space  
9 in which to physically inject water, right?  
10 **A. That's correct.**  
11 Q. So what I want to know is are there increased  
12 risks to water quality of one accounting method  
13 of creating recharge credits versus the other?  
14 **A. Yes. The -- leaving the water in place on the**  
15 **basis of water quality is -- is a better choice.**  
16 **There have been multiple studies done on this**  
17 **ASR project over the years looking at concerns**  
18 **with putting a different water quality into the**  
19 **ground, is that going to mobilize, one of the**  
20 **big ones I know they were concerned about was**  
21 **atrazine.**  
22 **MR. STUCKY:** Madam Hearing Officer,  
23 I'm going to object to this line of  
24 questioning, this witness doesn't even  
25 address water quality in his expert report,

1 current system, the current permit  
2 conditions.  
3 So I think it's, if not expressly stated  
4 in so many terms, I think this concept of  
5 why it's a good idea in the City's opinion  
6 to skip that step of disturbing the  
7 aquifer, I think that's something within --  
8 that's contemplated within the context of  
9 the proposal before us today.  
10 **MR. STUCKY:** I mean, I think we're  
11 here based on the face of the proposal  
12 itself, based on the scope of these given  
13 experts' perceived testimony and what their  
14 expertise is. And if there's no notice  
15 that a given expert is an expert on water  
16 quality and it's not even mentioned in the  
17 proposal, I'm not sure how for the first  
18 time we can show up at a hearing and be  
19 talking about these concepts.  
20 **MR. OLEEN:** I think I know why  
21 Mr. Stucky and the GMD don't like this line  
22 of questioning, and it's because it differs  
23 from the narrative that they're trying to  
24 focus on. And so I expect objections like  
25 this, but I think the public who are being

Page 1103

1 told certain things about what the proposal  
2 allows or doesn't allow or the consequences  
3 about it, I think this is something  
4 relevant to not only the public's concern  
5 but also yours, if there is a consequence  
6 to forcing the City, as they say that they  
7 will do, to pump the aquifer in order to  
8 create space in the hole to generate these  
9 recharge credits. So if there's a negative  
10 consequence to that versus recognizing this  
11 proposed accounting system, I think it's  
12 very relevant to what we're all here  
13 discussing.  
14 **PRESIDING OFFICER:** I think the  
15 relevance of that concept is not in  
16 question; I agree with you that that would  
17 be important information. The question is  
18 is that information within this witness's  
19 purview of expertise. I've heard him say  
20 he's heard this talked about, this might be  
21 something that is -- that logically makes  
22 sense to him, but I'm concerned about  
23 straying too far from his area of  
24 expertise.  
25 I think the -- if the City has an expert

Page 1104

1 that could talk more specifically about the  
2 impact on water quality, then that would be  
3 something the City could. I don't know if  
4 that's something they have ready to go, but  
5 if this expert is not -- if this is not  
6 within his area of expertise, I don't want  
7 to stray too far beyond what we've already  
8 heard.  
9 The concept has been described, I think  
10 he has said he has heard people discussing  
11 this, but if he doesn't have specific  
12 knowledge and background and personal  
13 analysis of what it would do to water  
14 quality, I don't think we should stray much  
15 farther into that.  
16 **MR. OLEEN:** I guess part of the  
17 problem is I don't know that it's an expert  
18 question, I guess. If you have a status  
19 quo and then you change the status quo, is  
20 there increased risk to affect the status  
21 quo, and I think the answer is probably  
22 yes. So I guess I'm not even certain it's  
23 a expert -- that it requires certain  
24 expertise.  
25 **A. Is it my place to interject? I'm just asking?**

Page 1105

1 **PRESIDING OFFICER:** Yes, what would  
2 you like to add?  
3 **A. It is required as part of the permit conditions**  
4 **that we operate under now that water quality be**  
5 **monitored for just this reason. The injected**  
6 **water quality has to be analyzed and reported**  
7 **annually, and my seal is on all of the annual**  
8 **accounting reports that report that. If that**  
9 **helps with where my area of expertise is.**  
10 **PRESIDING OFFICER:** That speaks to  
11 the existing permits and existing  
12 conditions.  
13 **A. The existing permits require that, yes.**  
14 **PRESIDING OFFICER:** But we're  
15 talking about the impact of the proposed  
16 changes.  
17 **A. Right, but the reason that that water quality**  
18 **data is monitored and reported annually is to**  
19 **evaluate any changes to the aquifer water**  
20 **quality. So it's monitoring for the same reason**  
21 **that Mr. Oleen was asking about, are we changing**  
22 **water quality by injecting and removing water?**  
23 **PRESIDING OFFICER:** So what changes  
24 would there be to the monitoring to reflect  
25 changes in the proposal?

Page 1106

1 **A. There would -- I'm sorry, I don't understand**  
2 **your question.**  
3 **MR. OLEEN:** Well, is it that the  
4 current permit conditions require the  
5 monitoring of water quality because of a  
6 concern that that water quality could be  
7 negatively impacted by this disturbing of  
8 the aquifer via withdrawal and injection,  
9 and if we're not withdrawing and injecting  
10 as part of the creation of recharge  
11 credits, then the concerns that originated  
12 the water quality monitoring are lessened.  
13 Even -- even though the water quality  
14 monitoring may continue.  
15 **PRESIDING OFFICER:** You want to say  
16 something?  
17 **A. I was just going to say that, yes, his statement**  
18 **is correct, the reason the water quality is**  
19 **monitored is to avoid changes to the aquifer**  
20 **water quality caused by the recharge water**  
21 **quality.**  
22 **PRESIDING OFFICER:** And that's a  
23 good thing, but I'm wondering, the  
24 questions are getting toward what changes  
25 do you anticipate by virtue of the

1 proposal, because what you're assuming is  
2 if the proposal doesn't happen, there will  
3 be negative consequences?

4 **MR. OLEEN:** Or a continuation of a  
5 certain amount of risk inherent in the  
6 currently authorized ASR project.

7 **PRESIDING OFFICER:** Has the current  
8 or prior monitoring revealed any such risk?  
9 Has revealed the realization of these  
10 risks? If the status quo is what you're  
11 concerned about, has the status quo shown  
12 increased risk?

13 **MR. OLEEN:** I can't speak to that  
14 other than to say why would it have been a  
15 monitoring -- why would the requirement of  
16 monitoring been a condition that the chief  
17 engineer imposed if there wasn't some risk  
18 associated with the act of withdrawing and  
19 injecting?

20 **PRESIDING OFFICER:** Good point. I'm  
21 going to let this line of questioning  
22 continue, but if we get too specific and I  
23 think we're getting too far, then I'm going  
24 to step in.

25 **MR. OLEEN:** So, Madam Officer, do I

1 **CROSS-EXAMINATION**  
2 **BY MR. STUCKY:**

3 Q. Yeah, I don't disagree with the fact that  
4 taking -- putting water in and out of an aquifer  
5 could have an impact on water quality. I guess  
6 my question for you is did you personally do any  
7 kind of modeling, MODFLOW modeling or otherwise,  
8 to determine the impact of the City's proposal  
9 on water quality?

10 **A. For this proposal?**

11 Q. For this proposal?

12 **A. Not for this proposal, no.**

13 Q. Okay. Thank you. Now, moving on to a prior  
14 discussion that occurred, what -- just so I'm  
15 clear, what work did you do with MODSIM and  
16 Vistas as it relates to the City's data, did you  
17 do any specific work with regard to that?

18 **A. I did not work with MODSIM. I reviewed the**  
19 **inputs and outputs from it and was in on some of**  
20 **the discussions where those were being decided**  
21 **upon. I did all of the MODFLOW modeling, with**  
22 **some assistance from Mr. Clement.**

23 Q. Okay. Now, I'd like to --

24 **MR. STUCKY:** May I approach the  
25 witness?

1 understand that I don't need to repeat any  
2 questions -- let me rephrase. Everything  
3 that Mr. McCormick has just been saying as  
4 part of this discussion is a part of the  
5 record of this hearing?

6 **PRESIDING OFFICER:** Correct.

7 **MR. OLEEN:** Okay.

8 **BY MR. OLEEN:**

9 Q. So just to be clear, then, Mr. McCormick, what  
10 I'm trying to understand, if there are benefits  
11 in the form of decreased risks of water quality  
12 contamination if an aquifer is left in place  
13 versus if an aquifer is disturbed by withdrawal  
14 and injection of water into it?

15 **A. I would say that that is correct, there are**  
16 **concerns that injected water quality could be in**  
17 **some way detrimental. As noted, there have not**  
18 **been to date, but if we're not injecting and**  
19 **pumping out water, then those concerns are gone**  
20 **and there is not that risk.**

21 **MR. OLEEN:** No further questions,  
22 thank you.

23 **PRESIDING OFFICER:** Mr. Stucky.

24 //

25 //

1 **PRESIDING OFFICER:** Yes.

2 **BY MR. STUCKY:**

3 Q. I've handed you, do you recognize that as your  
4 amended expert report?

5 **A. Yes.**

6 Q. Okay. And in your amended expert report, there  
7 is a variety of different opinions that are  
8 expressed. Would that be a true statement?

9 **A. I believe they're my opinions, so I don't know**  
10 **if they're a variety or different but ...**

11 Q. Would you agree that at least your expert report  
12 indicates that your expertise and opinions are  
13 based on what's presented in your expert report?  
14 And if we look at the first page, it says,  
15 subsection C, Paul McCormick's factual  
16 observations and opinions as presented in the  
17 proposal documents and summarized herein  
18 include, and then there's a list of the areas  
19 that you have expertise in?

20 **A. Yes.**

21 Q. Okay. So in answer to my question, would you  
22 agree that at least as it relates to your expert  
23 report, you identified certain areas of the  
24 proposal that we can have some assurance that  
25 you have expertise in; is that right?

Page 1111

1 **A. Yes.**  
 2 Q. Okay. And, in fact, at least as you indicated  
 3 it in your expert report, your expertise was  
 4 limited based on the areas that you identified  
 5 in the expert report, in your expert report. Is  
 6 that -- is that a true statement? In other  
 7 words, you don't mention MODSIM and doing any  
 8 analysis on growth projections for the City --  
 9 **A. Right.**  
 10 Q. -- and so that's outside the realm of your  
 11 expertise, correct?  
 12 **A. That is correct, yes.**  
 13 Q. And so strategically you've identified certain  
 14 areas with respect to the City's proposal that  
 15 you have expertise, and my question is did you  
 16 do that to -- to identify or limit the areas  
 17 that you could testify to in this hearing?  
 18 **A. My seal is on the proposal, and so I had to**  
 19 **review or be in on discussions for those things**  
 20 **that were in the proposal. So I have some**  
 21 **knowledge of anything that's in the proposal.**  
 22 **These things that I specifically did and**  
 23 **provided work product for are what is listed in**  
 24 **my expert testimony.**  
 25 Q. I'm going to ask you to look at subsection B of

Page 1112

1 your expert report. Could you read subsection B  
 2 of your amended expert report?  
 3 **A. On page 1?**  
 4 Q. Yes, on page 1.  
 5 **A. The grounds for Paul McCormick's opinions are**  
 6 **knowledge of pertinent information presented in**  
 7 **City of Wichita's response to production request**  
 8 **of Equus Beds Groundwater Management District**  
 9 **No. 2 and City of Wichita's responses to**  
 10 **Intervenors' production requests, as referenced**  
 11 **in the summaries of the respected opinions**  
 12 **below, and in several cases excerpted and**  
 13 **attached for convenience of reference.**  
 14 Q. So that paragraph indicates the grounds under  
 15 which your opinions were based. Is that a true  
 16 statement?  
 17 **A. Yes.**  
 18 Q. Can you explain to me in past work that you've  
 19 done where it is that you have dealt with  
 20 gradational losses previously, or is that kind  
 21 of a newer concept as it relates to the City's  
 22 proposal?  
 23 **A. For the City in particular or anywhere else?**  
 24 Q. Other projects where you've dealt with  
 25 gradational losses?

Page 1113

1 **A. Project wise, myself, we have never proposed**  
 2 **gradational losses. I have consulted with other**  
 3 **consultants in other states and looked at ASR**  
 4 **regulations in other states where they only use**  
 5 **gradational losses.**  
 6 Q. And how were gradational losses, how were those  
 7 accounted for, in your experience, in other  
 8 projects you worked on?  
 9 **A. What I have seen in literature and discussed**  
 10 **with others and -- is basically they -- they set**  
 11 **a percentage of what you put in the ground is**  
 12 **what you get out, and it's just a fixed percent.**  
 13 **In some places it's a time changing thing.**  
 14 **We -- I've never actually proposed a gradational**  
 15 **accounting system of my own in the past.**  
 16 Q. So just -- and that's my question, just to  
 17 clarify, the City's proposal is unique in your  
 18 experience in the sense that this is the first  
 19 time you're proposing such a concept. Would  
 20 that be a true statement?  
 21 **A. That is the first time I have proposed such a**  
 22 **concept.**  
 23 Q. Okay. In your expert report, which is still in  
 24 front of you for your convenience, you mention  
 25 that you did some work on the 1 percent drought

Page 1114

1 simulation. Is that a true statement?  
 2 **A. Yes.**  
 3 Q. Okay. And you indicate that the Equus Beds  
 4 groundwater flow model takes into account  
 5 various inputs, including variables for  
 6 increased agricultural irrigation pumping,  
 7 additional City pumping, reduced aquifer  
 8 recharge, reduced streamflow, and increased  
 9 evapotranspiration, slowing down for your  
 10 purposes. Is that stated in your expert report?  
 11 **A. Yes, it is.**  
 12 Q. Just a moment ago, Mr. Clement testified to the  
 13 fact that multi-year flex accounts and term  
 14 permits weren't -- although they were taken into  
 15 account for the years 2011 and 2012, he  
 16 testified that for additional years, there  
 17 weren't changes made to the modeling based on  
 18 changes in multi-year flex accounts or term  
 19 permits. Do you recall that discussion?  
 20 **A. I do.**  
 21 Q. As you're sitting here today, do you believe  
 22 that as we look to improving the model in the  
 23 future, is it possible for the model to take  
 24 into account a concept such as multi-year flex  
 25 accounts over the course of five years or new

1 term permits or things of that nature?  
2 **A. It is possible. I don't know how you would**  
3 **determine it, but it is possible.**  
4 Q. And one variable, I think, that's not noted  
5 there is return flows into the aquifer. Is that  
6 another variable that you considered?  
7 **A. Yes. And, no, I did not list it there, we just**  
8 **consider that as automatically done with the**  
9 **agricultural pumping.**  
10 Q. And would you also agree with the conversation  
11 that occurred earlier that as a drought  
12 prolongs, it's possible that the return flows  
13 could be different than what was modeled for the  
14 years 2011 and 2012?  
15 **A. I would agree with that.**  
16 Q. Is that something that the City could have  
17 addressed in future modeling?  
18 **A. I think it could be addressed by modeling, but I**  
19 **think that the level of error that would be**  
20 **incurred from that would be -- make the results**  
21 **meaningless.**  
22 Q. Let me ask you this: You would agree also with  
23 Mr. Clement's testimony that the pumping by the  
24 City fluctuated over the course of that eight  
25 years. Would you agree with that testimony?

1 course of eight years the City's purported water  
2 use changes based on their projected demands and  
3 as that -- as that morphs over the course of  
4 that eight years, if that changes, are there  
5 data sets available that would help to predict  
6 how an irrigator's use would change over the  
7 course of additional years in a drought? I  
8 understand that there's different crops you can  
9 grow, there's different variables that you can  
10 take into account that if you go to the  
11 individual irrigator make it difficult to  
12 predict the mindset of that irrigator, but,  
13 again, we're talking about statistics and we're  
14 talking about modeling, so are there statistics  
15 and is there a large data set that would help us  
16 to predict what irrigators collectively would do  
17 as a drought increases, that's my question?  
18 **A. We pretty much included that, I mean, we're**  
19 **looking at an average, an annual average of**  
20 **pumping in a -- a drought period, which is 2011**  
21 **to 2012, and we evaluated those statistics. I**  
22 **am not aware of anywhere that we have a database**  
23 **or any indication of what industry and**  
24 **agricultural demands would be for an eight-year**  
25 **drought period, I don't believe that that is in**

1 **A. Yes.**  
2 Q. However, irrigation pumping and other forms --  
3 or industrial pumping and other forms of pumping  
4 that were identified in that table remained  
5 constant for the years 2011 and 2012. Is that a  
6 true statement?  
7 **A. They were the reported values for 2011 and 2012.**  
8 Q. Do you believe that the model could be more  
9 accurate and the modeling could be more accurate  
10 if there was more variables taken into account  
11 with -- with respect to changes in irrigation  
12 pumping and other forms of pumping such as  
13 industrial or other municipal?  
14 **A. No.**  
15 Q. Okay. And what is the basis for that answer?  
16 **A. It becomes a guess. You're guessing what**  
17 **business A is going to -- that they're going to**  
18 **expand; I don't know their business plan.**  
19 **You're guessing that farmer B is going to**  
20 **continue to produce corn and is not going to**  
21 **switch to a less water intensive crop. So many**  
22 **variables come into it that the error, the**  
23 **potential error of your inputs just skyrockets**  
24 **and becomes unacceptable.**  
25 Q. Well, let me ask it this way: If over the

1 **existence. Or if it is, I'm not aware of it.**  
2 Q. Well, for example, do we know as -- for example,  
3 in 2013 and as the irrigators were still using  
4 the multi-year flex accounts, for example, do we  
5 know what their water use was in 2013, for  
6 example? I mean, would that -- would any of  
7 that data be useful to help with the projections  
8 for the City's modeling?  
9 **A. You got to remember we're out of the drought at**  
10 **that point, so there's a much higher**  
11 **precipitation rate, so they're not pumping as**  
12 **much, so that sort of negates that evaluation.**  
13 **If -- you know, obviously if we had continued**  
14 **through a five-year drought, and MYFA is a**  
15 **five-year program, we would have seen what would**  
16 **have happened. But at no time that I'm aware of**  
17 **did we see an actual occurrence of that that**  
18 **would provide a data set that would be useful in**  
19 **that way.**  
20 Q. So I think your testimony is that by replicating  
21 2011 and 2012, you utilized the best data you  
22 had available to you with respect to irrigation  
23 pumping. Is that what your testimony is?  
24 **A. I would say so.**  
25 Q. But at least to an extent, even just by

Page 1119

1 replicating 2011 and 2012 over the course of  
 2 eight years, aren't you guessing as to what  
 3 irrigation use would be during the course of  
 4 that entire eight-year drought also by  
 5 replicating those numbers?  
 6 **A. Yes, we're making an estimate based on what was  
 7 done in a drought period.**  
 8 Q. With respect to Mr. Clement, and your noted  
 9 expertise also has to do with drought simulation  
 10 and the variables that went into the modeling,  
 11 he indicated that there -- that more efficient  
 12 appliances, better conservation techniques in  
 13 the future, variables of that nature were not  
 14 included in the City's modeling. Would you  
 15 agree with that testimony?  
 16 **A. Yes, I would agree with that.**  
 17 Q. Now, in your expert report, I'm not sure that  
 18 you mention a lot about the development of  
 19 aquifer maintenance credits. You do talk about  
 20 the accounting, but I guess I'll ask you, were  
 21 you involved, were you the one that was involved  
 22 in coming up with the concept of aquifer  
 23 maintenance credits as it relates to the City's  
 24 proposal?  
 25 **A. No. The aquifer maintenance credit idea has**

Page 1120

1 **been around and been floated around for as long**  
 2 **as I've been with Burns & Mac, so since 2007**  
 3 **that I am aware of personally. I don't know who**  
 4 **initially came up with the idea, and I don't**  
 5 **know that anybody does at this stage of the**  
 6 **game.**  
 7 Q. Was that a concept that originated with Burns &  
 8 Mac, or was that a concept that --  
 9 **A. I have no idea.**  
 10 Q. Do you know why the concept of AMCs was  
 11 developed as early as 2007 or why it's been  
 12 around so long? In other words, my question is  
 13 this, was the City already envisioning the  
 14 possibility of aquifer maintenance credits as  
 15 early as 2007?  
 16 **A. No. No, when -- in 2007 when the system was**  
 17 **first started, there was a big hole in the**  
 18 **ground, we could put all the water we wanted to**  
 19 **in the ground. And, honestly, we weren't**  
 20 **expecting the substantial challenges that we**  
 21 **have now with the higher water levels.**  
 22 Q. Okay. So to answer my question, as ASR Phase I  
 23 and ASR Phase II occurred, this concept of AMCs  
 24 wasn't already envisioned as a future part of  
 25 the ASR project at that time?

Page 1121

1 **A. No. The first time it was ever brought up as a**  
 2 **real potential part was for this proposal that**  
 3 **I'm aware of.**  
 4 Q. And you have been at Burns & Mac for a long  
 5 time; is that right?  
 6 **A. I started in March of 2007.**  
 7 Q. And so you have some familiarity with, at least,  
 8 ASR Phase II?  
 9 **A. Phase I and Phase II, yes.**  
 10 Q. Okay. And the concept of passive recharge  
 11 credits?  
 12 **A. I'm familiar.**  
 13 Q. Did you ever have the occasion to analyze  
 14 whether or not the aquifer maintenance credits  
 15 were, in fact, a passive recharge credit? Did  
 16 you analyze that, or is that part of your  
 17 purported expertise here?  
 18 **A. We discussed that as part of the development of**  
 19 **the proposal.**  
 20 Q. Was that something that you specifically  
 21 considered or analyzed, other than just  
 22 reviewing the ultimate proposal and signing off  
 23 on it?  
 24 **A. I was in on the discussions, early discussions**  
 25 **when we came up with the idea and were concerned**

Page 1122

1 **that it would -- we were discussing whether or**  
 2 **not it would be a passive recharge credit and**  
 3 **determined that we did not feel it met the**  
 4 **criteria.**  
 5 Q. Okay. And you heard Mr. Clement's testimony,  
 6 you were in the room --  
 7 **A. Uh-huh.**  
 8 Q. -- so do you agree with Mr. Clement's testimony  
 9 as to -- in that regard as to whether an aquifer  
 10 maintenance credit is, in fact, a passive  
 11 recharge credit?  
 12 **A. I agree that it is not.**  
 13 Q. Okay. And what is the basis for your opinion in  
 14 that regard?  
 15 **A. The -- as -- not to restate Mr. Clement's whole**  
 16 **testimony, but that was taking water from an**  
 17 **alternate source and leaving it in the ground,**  
 18 **in the well field is considered a passive**  
 19 **recharge credit. In this case, we're taking**  
 20 **water -- we're pumping excess water, we're**  
 21 **treating it, we would be putting it in the**  
 22 **ground and then pumping it back out and then**  
 23 **sending it to town. In this case, we're simply**  
 24 **taking the steps out of injecting and**  
 25 **withdrawing, which is beneficial to the aquifer**

1 **and is not a passive action since we're treating**  
2 **it and doing the other things.**

3 Q. Okay. So, again, your idea here is that just  
4 because we're taking water, overflow water from  
5 the Little Arkansas River and we're diverting it  
6 directly to the City and then accumulating this  
7 aquifer maintenance credit, you're saying that  
8 those aren't passive credits in your viewpoint?

9 **A. We're not just diverting it to the City; we're**  
10 **treating it, using the infrastructure that's in**  
11 **place, and then sending it to the City.**

12 Q. With respect to an aquifer maintenance credit,  
13 though, are you first injecting that water into  
14 the aquifer?

15 **A. No.**

16 Q. So after you treat it, would it be true that it  
17 is then sent directly to the City for municipal  
18 use?

19 **A. Yes.**

20 Q. And then after it's sent to the City for  
21 municipal use, an aquifer maintenance credit  
22 would be accumulated. Is that a true statement?

23 **A. I would say an aquifer maintenance credit is**  
24 **accumulated when it is sent to the City.**

25 Q. Yeah. And that was my question, would that be a

1 true statement then?

2 **A. Yes.**

3 Q. So let's say, for example, that we took a gallon  
4 of water from El Dorado Reservoir and we sent it  
5 to our treatment plant there by Bentley and we  
6 treated that water and then we sent it to the  
7 City for municipal use. Do you believe that the  
8 City should get a credit for that water that was  
9 taken from El Dorado Reservoir, treated in  
10 our treatment facility, and then sent to the  
11 City, should the City get a credit for that?

12 **A. El Dorado is a different water source. That's**  
13 **switching sources.**

14 Q. I understand that.

15 **A. We're talking about above base flow water that's**  
16 **just flowing through the system that we're**  
17 **capturing.**

18 Q. So in this scenario of El Dorado, would you  
19 agree that under that scenario, at least, that  
20 would be a passive recharge credit as the term  
21 is used in ASR Phase I and Phase II?

22 **A. Well, I don't think that scenario could -- would**  
23 **occur, there would be no point in doing that.**  
24 **If you were taking water from El Dorado**  
25 **Reservoir and sending it directly to the main**

1 **water treatment plant in Wichita, you're not**  
2 **using the ASR infrastructure, and that would be**  
3 **a passive recharge credit.**

4 Q. Well, let's just say for one second here the  
5 only difference is instead of treating the water  
6 in Wichita, from the treatment facility in  
7 Wichita, you choose to treat the water in the  
8 treatment facility there by Bentley, which is  
9 part of the ASR infrastructure, treatment  
10 infrastructure, and I think you could at least  
11 agree with me that under my hypothetical,  
12 hypothetically speaking, that that's a  
13 possibility that could at least occur. So my  
14 question is not whether you treat the water at  
15 the treatment plant in the City of Wichita, but  
16 if you were to treat that gallon of water from  
17 El Dorado Reservoir in the treatment facility  
18 there by Bentley and then you tried to obtain a  
19 credit for that, would that be a passive  
20 recharge credit?

21 **A. You wouldn't do that because all water going**  
22 **into the City of Wichita goes to the main water**  
23 **treatment plant for treatment prior to going**  
24 **into the distribution system. So you wouldn't**  
25 **send it to -- even if you sent it to the Phase**

1 **II treatment plant, you would treat it there,**  
2 **and then you would send it to the main water**  
3 **treatment plant to treat it again. So your**  
4 **scenario would never occur.**

5 Q. Okay. Well, and I understand under current  
6 policies of the City and current infrastructure,  
7 I understand that that probably wouldn't occur,  
8 but I'm just saying hypothetically if, just so I  
9 can try and conceptualize this, if we took a  
10 gallon of water from El Dorado Reservoir,  
11 treated it at the Bentley facility, and then  
12 used it in the City of Wichita, would one be  
13 allowed to obtain a credit for that gallon of  
14 water that was taken out of El Dorado Reservoir?

15 **A. And, again, I don't think that could happen.**

16 Q. Would you receive a credit for that?

17 **A. I have no idea.**

18 Q. Okay. Well, let me ask you this: Let's say the  
19 water was taken from Cheney Reservoir, which is  
20 what was specifically envisioned with respect to  
21 having, I guess, prophylactic measures to ensure  
22 that we did not have these passive recharge  
23 credits. So with respect to Cheney Reservoir,  
24 if you take 1 gallon of water, treat it in the  
25 treatment facility there by Bentley, and then

Page 1127

1 use it for municipal use in the City, should the  
 2 City get a credit for that gallon of water?  
 3 **A. I would say no, I wouldn't say -- I would say**  
 4 **the City would never do that because it's a**  
 5 **waste of money.**  
 6 Q. And if they did that, not only would it be a  
 7 waste of money, but it would also be a passive  
 8 recharge credit; is that correct?  
 9 **A. It sounds to me like it would be a deliberate**  
 10 **attempt to get around the regulation, and I**  
 11 **don't see the City attempting that.**  
 12 Q. And not only would it be a waste of money, it  
 13 would be a deliberate attempt to get around a  
 14 regulation, you don't foresee the City would do  
 15 that, but if they did that, it would be a  
 16 passive recharge credit; is that right?  
 17 **A. If you're taking from the one source, by**  
 18 **definition, I would say, yes, you took it from**  
 19 **Cheney and put it in the -- tried to do that,**  
 20 **that would not work.**  
 21 Q. And if you took water from, let's say, overflows  
 22 from the Big Ark River and the City said, let's  
 23 receive credits for taking overflows from the  
 24 Big Ark River instead of from the aquifer itself  
 25 and wanted a credit for that, would that be

Page 1128

1 considered a passive recharge credit?  
 2 **A. I don't believe so.**  
 3 Q. Okay. And what is the basis for that opinion?  
 4 **A. It's above base flow water being taken out and**  
 5 **treated, it could potentially be injected into**  
 6 **the aquifer as a physical recharge credit, or it**  
 7 **could be diverted to town as a aquifer**  
 8 **maintenance credit, and at that point it would**  
 9 **be -- it would just be coming from above base**  
 10 **flow in a -- in the Ark as opposed to above base**  
 11 **flow in the Little Ark.**  
 12 Q. So I'm trying to understand the distinction  
 13 between, let's say, Cheney Reservoir or  
 14 El Dorado Reservoir and the Little Ark River on  
 15 the other -- on the other hand. And I think one  
 16 of the distinctions that's been made is that  
 17 when the Little Ark River floods, there's at  
 18 least a potential that that water could be  
 19 injected into the aquifer, is that at least one  
 20 distinction that's been made?  
 21 **A. I would say that is a distinction that's been**  
 22 **made, yes.**  
 23 Q. So let's say that the City built the  
 24 infrastructure to pipe water from Cheney  
 25 Reservoir when it flooded and inject that water

Page 1129

1 into the aquifer. Let's say that infrastructure  
 2 was put into place and the City was able, then,  
 3 to inject water from Cheney Reservoir when it  
 4 was flooding into the aquifer. If that  
 5 occurred, then would the City be allowed to  
 6 obtain recharge credits for the possibility that  
 7 they could inject water into the aquifer from  
 8 Cheney Reservoir?  
 9 **A. I don't understand your question, the lake**  
 10 **doesn't flood, the lake fills up. So the lake**  
 11 **is a reservoir holding a certain amount of**  
 12 **water. So you're not taking -- there is no**  
 13 **above base flow in a lake.**  
 14 Q. Well, for example, if they open up, you know,  
 15 the dam, if you will, in Cheney Reservoir and  
 16 they're letting out water, could you pull water  
 17 out of the Ninnescah River as it floods and it's  
 18 coming out of the reservoir, could you pull that  
 19 water out and inject it into the aquifer?  
 20 **A. That would be a transient water resource, and if**  
 21 **it was properly treated, I think it could be**  
 22 **injected, but ...**  
 23 Q. So if we follow your line of testimony, if that  
 24 infrastructure was put into place where when the  
 25 Ninnescah River floods, you could inject that

Page 1130

1 water into the aquifer, my question is, then, if  
 2 just merely putting that infrastructure in  
 3 place, does that eliminate the concept of a  
 4 passive recharge credit with respect to Cheney  
 5 Reservoir, or is there a different distinction  
 6 between Cheney Reservoir and the Little Arkansas  
 7 River?  
 8 **A. The concept is to take water that is transient**  
 9 **and would not stay in the system. Cheney stays**  
 10 **in the system because it's -- the water is**  
 11 **behind a dam. If Cheney was so full that**  
 12 **they're having to release from Cheney, you have**  
 13 **a serious flood event going on. It's about --**  
 14 **it's about having different storage tanks and**  
 15 **you're capturing an additional source of water**  
 16 **that's transient and doesn't come into the**  
 17 **basin. It's not -- I guess I ...**  
 18 Q. I guess perhaps -- perhaps you'll have to  
 19 educate me on the definition of transient. At  
 20 least in my simple mind, the way I understand  
 21 this is as Cheney -- when Cheney Reservoir  
 22 flows -- or fills up, water is flowing into  
 23 Cheney Reservoir from the Ninnescah River, and  
 24 so in that sense we're talking about transient  
 25 water that's flowing into Cheney Reservoir?

1 **A. No, it flows in and is held there for use.**  
 2 Q. Okay. So you're saying that no water flows out  
 3 of Cheney Reservoir?  
 4 **A. No, I'm not saying that.**  
 5 Q. Okay. So how -- I guess I'm just having a hard  
 6 time understanding that when we're talking about  
 7 water flowing into Cheney Reservoir that  
 8 eventually also flows out how that's not  
 9 transient water but the Little Arkansas River is  
 10 transient water, I'm still having trouble  
 11 understanding the difference?  
 12 **A. Well, all rivers flow by definition and they**  
 13 **have a base flow number. And what we're talking**  
 14 **about are flood events that are substantially**  
 15 **more than that, and that water would migrate**  
 16 **through without infiltrating into the aquifer or**  
 17 **being used for any beneficial use; it's just**  
 18 **zipping downstream. So that would be a**  
 19 **transient event.**  
 20 Q. What about Cheney being used above  
 21 the conserv -- above the conservation pool?  
 22 When the flood pool is released in Cheney  
 23 Reservoir, wouldn't that be transient water?  
 24 Under your definition?  
 25 **A. I guess that would be a man-made flood. I**

1 **don't ...**  
 2 Q. You know what, I'll move on to another line of  
 3 questioning.  
 4 **MR. STUCKY:** Madam Hearing Officer,  
 5 I do note that it's just a little after  
 6 5:00, would you like me to continue or to  
 7 resume tomorrow morning?  
 8 **PRESIDING OFFICER:** Well, I'm sort  
 9 of assuming that we won't be finished with  
 10 Mr. McCormick in the next 15, 20 minutes?  
 11 **MR. STUCKY:** No.  
 12 **PRESIDING OFFICER:** Okay. Then it  
 13 would probably be good to stop now and  
 14 resume tomorrow morning at 9:00. Thank  
 15 you.  
 16 (Whereupon, the proceedings were  
 17 adjourned at 5:03 p.m.)  
 18

1 **PRESIDING OFFICER:** Okay. We are  
 2 now back on the record. It is Tuesday,  
 3 February 11, 2020, it's 9:00 a.m. in the  
 4 morning, and we're continuing with the  
 5 hearing for the City of Wichita's request  
 6 to modify their ASR Phase II project. And  
 7 we will pick up from where we were  
 8 yesterday, and I believe, Mr. Stucky, you  
 9 were on cross with Mr. McCormick.  
 10 **MR. STUCKY:** All right. Thank you.  
 11

12 **CROSS-EXAMINATION (Cont.)**  
 13 **BY MR. STUCKY:**  
 14 Q. Yesterday, I think when we concluded, we were  
 15 having a conversation about transient water as  
 16 it relates to El Dorado Reservoir and as it  
 17 relates to Little Arkansas River, and I think I  
 18 heard part of your testimony to say that one of  
 19 the things that we would not do is take water  
 20 directly from El Dorado to the treatment plant  
 21 by Bentley and then treat it again in Wichita.  
 22 Was that one of the things you said?  
 23 **A. I did say that.**  
 24 Q. But just so I'm clear, right now, when there's  
 25 overflow water from the Little Arkansas River,

24

25

1 wouldn't it be a true statement that that  
 2 overflow water is taken to Bentley for treatment  
 3 and then also taken to the plant in Wichita for  
 4 further treatment?  
 5 **A. Yes.**  
 6 Q. Now, let's move on to a conversation about the  
 7 recharge capacity that the City has. Yesterday  
 8 you heard some testimony from Mr. Clement about  
 9 the current infrastructure the City has in place  
 10 and their recharge -- and the accompanying  
 11 recharge capacity the City has. Do you recall  
 12 that discussion?  
 13 **A. Uh-huh. Yes.**  
 14 Q. Now, there was a chart that was discussed and  
 15 some testimony by Mr. Clement, and I believe  
 16 that he said when the City was trying to  
 17 consider what was available, what their recharge  
 18 capacity was, they were excluding basin  
 19 number 36 from the calculations. Do you recall  
 20 that discussion?  
 21 **A. I do.**  
 22 Q. Okay. And I think he also mentioned that they  
 23 were excluding recharge basin 2 from the  
 24 calculations. Do you recall that discussion?  
 25 **A. I do.**

Page 1142

1 Q. As you're sitting here today, can you explain to  
 2 me, first of all, why basin 36 is being  
 3 excluded?  
 4 **A. Basin 36 is in the southeast corner of the basin**  
 5 **storage area, and it is more intended for**  
 6 **operations purposes, for cycling the plant on**  
 7 **and off, because it's not ideally located for**  
 8 **recharge activities due to the fact that most of**  
 9 **the water that you put in it immediately leaves**  
 10 **the basin storage area or flows into the Little**  
 11 **Ark. And there is not a lot of infrastructure**  
 12 **to recover the water that is put into basin 36.**  
 13 Q. Same question for basin 2?  
 14 **A. Basin 2 is in the northwest corner along the**  
 15 **Phase I -- it's part of the Phase I**  
 16 **infrastructure, and the reason it's excluded**  
 17 **from the calculations is there's -- you can't**  
 18 **recover water from a basin, it's simply an**  
 19 **injection point.**  
 20 Q. Now, though, if it's an injection point, isn't  
 21 there a possibility that the basin could allow  
 22 for recharge, though, of the aquifer?  
 23 **A. The basin does recharge the aquifer.**  
 24 Q. And so in -- in the event that basin 2 is useful  
 25 for that purpose, why would it be excluded from

Page 1143

1 the calculations?  
 2 **A. Because you can't recover water from a basin and**  
 3 **we're looking at water pumping facilities, water**  
 4 **pumping infrastructure.**  
 5 Q. Yesterday there was a discussion about appendix  
 6 I, it's in the black notebook. There was a  
 7 chart in appendix I.  
 8 **MR. STUCKY:** May I approach the  
 9 witness?  
 10 **PRESIDING OFFICER:** Yes.  
 11 **A. The hydrographs?**  
 12 **BY MR. STUCKY:**  
 13 Q. Yeah. A blue chart.  
 14 **A. That one, you bet.**  
 15 Q. And I asked a series of questions yesterday  
 16 about a chart that you now have in front of you  
 17 on appendix I.  
 18 **A. Uh-huh.**  
 19 Q. Just for the record, what is that chart called?  
 20 **A. Modeled aquifer conditions as a percentage of**  
 21 **predevelopment aquifer thickness by ASR index**  
 22 **well extracted from upper model layer (1) -**  
 23 **equivalent to index well A aquifer interval.**  
 24 Q. And would you agree with me that that's a blue  
 25 chart, just for the record?

Page 1144

1 **A. Sure, yes.**  
 2 Q. If you could refer to IW12 in that chart.  
 3 **A. Okay.**  
 4 Q. And would you note that the numbers for IW12 are  
 5 100 percent across the entire chart?  
 6 **A. Yes.**  
 7 Q. Can you explain to me why during that eight  
 8 years of simulation it would remain at  
 9 100 percent at all times?  
 10 **A. Index well -- or index cell 12, if you flip back**  
 11 **one page to the map of the basin storage area**  
 12 **just for reference, we're sitting in index cell**  
 13 **12, it's the City of Halstead, and I don't**  
 14 **believe there's any significant pumping**  
 15 **infrastructure in this cell so there's nothing**  
 16 **to lower the water levels. Or I'm not aware of**  
 17 **any significant --**  
 18 Q. So you're saying that --  
 19 **A. -- pumping infrastructure in the cell.**  
 20 Q. So during the drought simulation, in year one,  
 21 it was perceived that the aquifer would be  
 22 completely full in this cell, is that what this  
 23 is saying, in year one of the simulation?  
 24 **A. No, it would have been -- it would have started**  
 25 **at the '98 levels, so if -- well, if the '98**

Page 1145

1 **water levels were 100 percent saturated**  
 2 **thickness in this index cell, then, yes, it**  
 3 **would be 100 percent full at the start. It**  
 4 **would depend on what those actual water levels**  
 5 **were.**  
 6 Q. Okay. So I'm just looking at this chart, and  
 7 second from the left, it says initial aquifer  
 8 condition, percent full, and you have it listed  
 9 there as 100 percent full.  
 10 **A. Okay, yeah.**  
 11 Q. And so you're saying during the eight years of  
 12 simulation that this particular index cell  
 13 wouldn't go down at all in that eight years of  
 14 simulation, is that what this graph is showing?  
 15 **A. It's showing that the average water level in**  
 16 **this cell would not change at all.**  
 17 Q. Okay. Now, I have a question also, you know,  
 18 some of the other index cells like index cell 11  
 19 and index cell 7, do those have significant  
 20 degrees of pumping in those index cells?  
 21 **A. I'm just going off memory for those --**  
 22 Q. I'd ask that you go ahead and flip back roughly  
 23 one, two, three pages in that same attachment,  
 24 there's a map?  
 25 **A. Right.**

1 Q. And I believe that it shows -- the triangles  
2 show wells?

3 **A. Yeah, those are the City wells.**

4 Q. Okay.

5 **A. And there is no City infrastructure in those  
6 cells. I'm not familiar with it -- enough with  
7 it to know what industrial or agricultural wells  
8 exist in those wells.**

9 Q. So my question was for index cell 7 and index  
10 cell 11, we'll note that in the model simulation  
11 from the initial condition to the final  
12 condition, the percentage declines in those --  
13 in 7 and 11, would you agree with me, at least  
14 with respect to those two? For 7, for example,  
15 it goes --

16 **A. Yes, there is a -- a decline in both 7 and 11.**

17 Q. So I guess what I'm trying to understand is what  
18 is the difference between 7 and 11 on one hand,  
19 which actually see declines, and we don't see  
20 significant infrastructure shown in that map, or  
21 any infrastructure shown in that map, versus  
22 index well 12 where there's no decline at all,  
23 can you explain the difference?

24 **A. As I said, there's no City infrastructure  
25 associated with the City's Equus Beds well field**

1 was no depletion at all, is that what your  
2 simulation shows?

3 **A. That's what the model shows, yes.**

4 Q. Did you -- in the past, have you had the  
5 occasion to submit the official accounting  
6 reports to the Division of Water Resources?

7 **A. Yes.**

8 Q. And when did you first start submitting the  
9 annual accounting reports to the Division of  
10 Water Resources?

11 **A. 2007.**

12 Q. And, in fact, do you also submit those  
13 accounting reports to the Equus Beds Groundwater  
14 Management District?

15 **A. As we discussed yesterday, I submit three copies  
16 to the DWR and one copy directly to Mr. Boese  
17 simultaneously.**

18 Q. And in the past, have you and Mr. Boese had  
19 discussions about the nature of those accounting  
20 reports?

21 **A. Yes.**

22 Q. And, in fact, has Mr. Boese, let me just say it  
23 this way, caught irregularities in those reports  
24 in the past?

25 **A. Mr. Boese has brought them to my attention. I**

1 **in those cells, that's all that's shown on that  
2 map. We don't know if there's industry  
3 pumping -- the figure that we're looking at does  
4 not show that there is any industry wells or  
5 irrigation wells in those cells, and off the top  
6 of my head, I can't tell you what cells are in  
7 there -- or what wells are in those cells or how  
8 much they are pumping. I would suspect that  
9 since they show declines there is our irrigation  
10 or industrial wells that pump a significant  
11 amount of water in those cells.**

12 Q. Well, let me ask you this: In the town of  
13 Halstead, are there no domestic wells that  
14 homeowners have in the town of Halstead, do they  
15 not have any domestic wells that would deplete  
16 down the aquifer?

17 **A. I suspect, I don't know that there are domestic  
18 wells in the town of Halstead. Domestic wells  
19 are pumping at 10 gallons a minute, and I would  
20 not expect a domestic well to significantly  
21 deplete the aquifer, to even show up in the --**

22 Q. Okay. So --

23 **A. -- in the modeling that was done.**

24 Q. And based on your simulation for this area, for  
25 the City of Halstead, you're saying that there

1 **believe he typically had his staff  
2 hydrogeologist review the reports, and, yes,  
3 they have found irregularities or errors,  
4 whatever you'd like to call them.**

5 Q. So, for example, in a 2012 annual accounting  
6 report, do you recall Mr. Boese calling you up  
7 and indicating that the report was submitted  
8 with no recharge activity shown in the  
9 accounting report? Do you recall that  
10 conversation?

11 **A. No.**

12 Q. In other words, the accounting report, it was  
13 either a call or email, and the accounting  
14 report indicated that there was -- there was no  
15 recharge activity shown on the accounting  
16 report, and Mr. Boese contacted you and  
17 indicated there should have been for 2012, and  
18 then the report was corrected. Do you recall  
19 that conversation?

20 **A. I do not recall that specific conversation.**

21 Q. With respect to the accounting report for 2015,  
22 do you recall receiving a letter from Mr. Boese  
23 with the Equus Beds Groundwater Management  
24 District where he indicated that there were a  
25 number of concerns with the accounting report

Page 1150

1 that he'd identified?

2 **A. Mr. Boese has submitted a letter to DWR and**

3 **copies me on it each year, and in various years,**

4 **he has pointed out things that he would like to**

5 **see included or concerns that he had with it. I**

6 **don't recall the specific 2015 letter.**

7 Q. So your recollection was that he'd sent a letter

8 to DWR, that you had been copied on this

9 particular letter, and then some of those

10 concerns were addressed, is that your

11 recollection?

12 **A. Typically, that is what happens. I can't speak**

13 **directly to the 2015 letter, I don't recall it.**

14 **MR. STUCKY:** May I approach the

15 witness?

16 **PRESIDING OFFICER:** Yes.

17 **BY MR. STUCKY:**

18 Q. Do you recognize this letter?

19 **A. It looks like a letter to me from Tim, cosigned**

20 **by Steve Flaherty, with a list of concerns and**

21 **issues that he has with the letter.**

22 Q. So in other words, this particular letter -- and

23 these were concerns identified with the 2015

24 annual accounting report; is that correct?

25 **A. Yes, that's what the letter says.**

Page 1151

1 Q. And who is this letter addressed to?

2 **A. This one is addressed to me, so Tim probably**

3 **sent it to me prior to sending his actual letter**

4 **to the DWR.**

5 Q. And in this particular letter, he outlines a

6 number of concerns --

7 **A. Uh-huh.**

8 Q. -- that he and his hydrologist identified with

9 an annual accounting report. Is that a true

10 statement?

11 **A. Looks like it, yes.**

12 Q. And could you tell me just in a nutshell for the

13 record, now that you're able to refresh your

14 memory, what some of those concerns were?

15 **A. Well, first one is water quality data for**

16 **shallow wells was not included. Ah, okay, this**

17 **is refreshing my memory. It indicates more**

18 **recharge credits were gained than the -- than**

19 **were actually recharged, which is an obvious**

20 **problem. And then it has questions about ASR**

21 **cells, specific cells, recharge credits along**

22 **the Little Ark River, concern about the labeled**

23 **amount of precipitation, number of calibration**

24 **measurements compared to the previous report.**

25 **Asked about the date of the last calibration,**

Page 1152

1 **there was a significant figures question that**

2 **they had, two table values not matching,**

3 **correction on a map to the well numbers, the DWR**

4 **well numbers, and then comment that the figure 1**

5 **is -- has small printing and it's hard to read.**

6 Q. So in other words, Mr. Boese, along with his

7 hydrologist, identified a number of concerns, at

8 least, in that letter with the 2015 annual

9 accounting report. Is that a true statement?

10 **A. I would say so.**

11 Q. And how did you respond to that particular

12 letter?

13 **A. I, again, don't remember specifically.**

14 **MR. STUCKY:** May I approach the

15 witness?

16 **A. Great.**

17 **PRESIDING OFFICER:** Yes.

18 **BY MR. STUCKY:**

19 Q. Trade ya.

20 **A. That's what I was going to say is typically what**

21 **we do is we write a letter back, we list the**

22 **concern that Mr. Boese had and then we write a**

23 **paragraph or a few paragraphs responding to his**

24 **concerns and questions.**

25 Q. So in other words, when Mr. Boese sent his

Page 1153

1 concerns to you, you identified those concerns

2 and you addressed those concerns in a letter

3 that you sent back to Mr. Boese. Is that a true

4 characterization?

5 **A. I think so.**

6 Q. And would you also agree that this letter that

7 was sent by Mr. Boese, the April 4, 2017 letter

8 that was sent by Mr. Boese, that was sent to you

9 after the 2015 annual accounting report was

10 submitted; is that right?

11 **A. Yes. I think.**

12 Q. And so would you also agree to me -- agree with

13 me that after this April 4, 2017 letter was sent

14 by Mr. Boese and after you addressed it through

15 a response, would you agree with me that a new

16 accounting report was then submitted that

17 addressed the concerns in Mr. Boese's letters?

18 And you can look at that letter to refresh your

19 memory in that regard.

20 **MR. STUCKY:** May I approach the

21 witness?

22 **PRESIDING OFFICER:** Yes.

23 **A. Does it state somewhere in the letter that --**

24 **BY MR. STUCKY:**

25 Q. Yeah.

1 **A. Okay, great, that's what I was looking for.**  
2 Q. Okay. On the very first page of your response  
3 letter -- and what was the date of your response  
4 letter by the way?  
5 **A. April 13th, 2017.**  
6 Q. On the very last line of that first page, could  
7 you read that sentence?  
8 **A. A revised table 4.2 will be included when the**  
9 **report is reissued.**  
10 Q. Okay. So in other words, does that refresh your  
11 memory on whether or not you submitted a new  
12 report?  
13 **A. I would assume that, based on that statement,**  
14 **that I did.**  
15 Q. And so if I were to tell you that you submitted  
16 a 2015 accounting report and then you addressed  
17 the errors that were identified by the District  
18 and resubmitted a new accounting report, would  
19 that sound like an accurate statement?  
20 **A. That sounds like the actions that I would take,**  
21 **but I honestly don't recall the exact**  
22 **circumstances of having done it.**  
23 Q. So without engaging in this exercise for each  
24 accounting report, would you at least agree with  
25 me that in the past there's been a collegial

1 **storage that had been depleted and seemed like a**  
2 **good target.**  
3 Q. I want to focus in on that last part. You said  
4 that the 120,000 acre-foot cap happened to  
5 coincide with the available storage in the  
6 aquifer, so this was just merely coincidental  
7 that the 120,000 coincided with the available  
8 capacity in the aquifer after depletion?  
9 **A. I think that was what we used as a check that**  
10 **made it seem like a good target.**  
11 Q. So, in fact, was the 120,000 acre-foot cap based  
12 on the fact that that number represented the  
13 available storage in the aquifer after  
14 depletion?  
15 **A. I don't believe it was based on that, no.**  
16 Q. I'd like to move to the discussion about Bentley  
17 and the W&S well field that we had yesterday  
18 with Mr. Clement.  
19 **A. Okay.**  
20 Q. Would you agree --  
21 **A. It's the E&S well field, not the W&S well field.**  
22 Q. Ah, thanks for correcting the record. With  
23 respect to the Bentley reserve well field, would  
24 you agree that there's two wells, at least, in  
25 the Bentley reserve well field that have no

1 and helpful dialogue between the District and  
2 Burns & Mac regarding these accounting reports?  
3 **A. I would agree there's been a dialogue regarding**  
4 **them; it has not always been collegial.**  
5 Q. Would you agree that the District has in the  
6 past identified concerns, at least, with the  
7 accounting reports that have been submitted by  
8 Burns & Mac and has, in fact, corrected or  
9 identified errors in those reports?  
10 **A. I would certainly agree with that.**  
11 Q. Yesterday there was a discussion regarding the  
12 120,000 acre-foot cap in the City's proposal?  
13 **A. Yes.**  
14 Q. And I just want to make sure that I understood  
15 this point and it wasn't missed, how was that  
16 120,000 acre-foot number derived?  
17 **A. My recollection is that we deter -- or that it**  
18 **was determined, Burns & Mac didn't do the**  
19 **numbers, but it was determined that 60,000 or**  
20 **slightly more acre-feet would be the 1 percent**  
21 **drought -- amount of ASR credits that the City**  
22 **would like to hold for -- would use in a 1**  
23 **percent drought, and then a contingency was**  
24 **added onto that, bumping it up to 120, which**  
25 **also happened to coincide with the volume of**

1 restrictions on minimum flow requirements, would  
2 you agree with that statement?  
3 **A. The two wells in the south central -- there's**  
4 **six wells, three lines side by side, the two**  
5 **wells farthest from the river in the southwest**  
6 **corner have a native water right. They do have**  
7 **water quality concerns, though.**  
8 Q. Now, tell me why those two don't have any kind  
9 of minimum flow requirement before one can pump  
10 out of those wells and the other four do, can  
11 you explain the difference?  
12 **A. Those two have a native Equus Beds water right**  
13 **or are associated with a native water right.**  
14 **The other four are considered bank storage wells**  
15 **that are recharged by the flow in the Arkansas**  
16 **River.**  
17 Q. And do you know what the cap is for the two  
18 wells that don't have a minimum flow requirement  
19 of the river?  
20 **A. Not off the top of my head, I do not, no.**  
21 Q. If I were to tell you it was 837 acre-foot a  
22 year combined, would you disagree with that  
23 number?  
24 **A. I have no reference to agree or disagree with**  
25 **that number without seeing the actual water**

Page 1158

1 **right.**  
 2 Q. So in other words, with respect to those two  
 3 wells, at least, and I know that there was a  
 4 quality concern mentioned, but at least with  
 5 respect to those two wells, regardless of what  
 6 the flow of the river is, those two wells could  
 7 be available for appropriation by the City at  
 8 all times. Is that a true statement?  
 9 **A. I would need to see the water right. I believe**  
 10 **there is -- there is something about blending of**  
 11 **that water due to the water quality, but I can't**  
 12 **recall off the top of my head.**  
 13 Q. So at least as you're sitting here right now,  
 14 your answer is you're unsure in that regard; is  
 15 that correct?  
 16 **A. I would have to read the water right to make an**  
 17 **accurate statement about that.**  
 18 Q. Yesterday there was a discussion about  
 19 contingencies --  
 20 **A. Uh-huh.**  
 21 Q. -- as it relates to the City's proposal, and we  
 22 talked about the fact that there was a 10-foot  
 23 contingency in the City's proposal. And I had  
 24 asked for the scientific basis behind the  
 25 10-foot contingency, and I guess as I'm still

Page 1159

1 standing here today, I'm unclear what that  
 2 answer was as far as what that scientific basis  
 3 was. Can you explain to me the rationale for  
 4 the 10-foot contingency?  
 5 **A. A contingency is to cover things that are**  
 6 **unknown or unforeseen that occur, changes in**  
 7 **pumping, changes in where we start, whatever.**  
 8 **As I recall, the way that came about, we**  
 9 **originally put a 5-foot contingency on that, and**  
 10 **when we met with the GMD and Mr. Boese in one of**  
 11 **those meetings to have a, how did you term it,**  
 12 **collegiate discussion about this, Mr. Boese**  
 13 **questioned whether 5 was enough and asked if we**  
 14 **wanted to do 10, and we said we could do 5 or**  
 15 **10. And 10 was selected based on the number of**  
 16 **unknowns and unforeseen circumstances.**  
 17 Q. So in other words, if your testimony is here  
 18 today that Burns & Mac agreed with a 5-foot  
 19 contingency and that's what they wanted to put  
 20 in their proposal -- I just want to make sure I  
 21 understand your testimony, let's strike that  
 22 question and I'll back up. Just to make sure I  
 23 understand, originally Burns & Mac believed that  
 24 a 5-foot contingency was adequate, but then  
 25 Mr. Boese from the District suggested that there

Page 1160

1 should be a 10-foot contingency. Does that sum  
 2 up your testimony accurately?  
 3 **A. I think Mr. Boese had additional concerns that**  
 4 **he pointed out and additional things that he**  
 5 **worried about being unforeseen, possibly adding**  
 6 **wells, other users maybe; I don't recall the**  
 7 **exact discussions, but he suggested that a**  
 8 **larger contingency might be a good idea, and we**  
 9 **accepted his suggestion.**  
 10 Q. So in other words, once again, Mr. Boese with  
 11 the Equus Beds Groundwater Management District  
 12 identified some items or some concerns that  
 13 Burns & Mac had not thought of as they developed  
 14 this proposal. Is that a true statement?  
 15 **A. I believe he brought up some things that he was**  
 16 **concerned about that we didn't feel we had**  
 17 **adequately addressed previously.**  
 18 Q. And so based on these new concerns or new  
 19 perceived issues with the modeling that was  
 20 performed by Burns & Mac, it was determined that  
 21 this new contingency would be added; is that  
 22 correct?  
 23 **A. I don't believe it was perceived issues with the**  
 24 **modeling. I believe it was perceived issues**  
 25 **that he was aware of that we were not.**

Page 1161

1 Q. Do you recall what those issues were?  
 2 **A. As I said, possibly adding wells, something like**  
 3 **that, I'm -- it's a long time ago, and I'm just**  
 4 **going off foggy memory on that one.**  
 5 Q. Well, let me ask you this: If Mr. Boese was the  
 6 one who, in your mind, suggested the 10 percent  
 7 contingency and Burns & Mac originally  
 8 recommended a 5 percent contingency, if a 10  
 9 percent contingency is no longer Mr. Boese's  
 10 recommendation, would Burns & Mac support a 5  
 11 percent contingency at this juncture?  
 12 **A. I believe it's 5 foot or 10 foot --**  
 13 Q. My mistake.  
 14 **A. -- instead of percent, just to make sure the**  
 15 **record's correct. I believe based on the**  
 16 **concerns that were expressed, it was determined**  
 17 **that a 10 foot was appropriate, and that is what**  
 18 **we put in the proposal.**  
 19 Q. So even if Mr. Boese doesn't recall that  
 20 discussion or he's recommending a 5-foot  
 21 contingency at this point, it's still Burns &  
 22 Mac's position that we should have a 10-foot  
 23 contingency. Is that a true statement?  
 24 **A. We have that -- that is what is in the current**  
 25 **proposal.**

1 Q. And my question, then, is I guess I want to know  
2 what the good reasons were for changing from a  
3 5-foot contingency to a 10-foot contingency, if  
4 you could outline what those particular concerns  
5 were, other than a vague memory of what  
6 occurred?

7 **A. I don't have any documentation to refresh my  
8 memory in front of me, those were the concerns  
9 that were brought up, and based on the  
10 discussions that we had in the meeting with  
11 Mr. Boese, it was -- a 10 foot was selected.**

12 **That's what's in the proposal, I would want to  
13 go back and look at those concerns in detail  
14 before I would be willing to say I was ready to  
15 change my contingency. If we made that  
16 statement and put that contingency in the  
17 proposal, there were good reasons behind it.**

18 Q. You have the proposal in front of you, is there  
19 anything in the proposal itself that would  
20 refresh your memory in that regard?

21 **A. Short of reading through the whole proposal  
22 right now, nothing springs to mind.**

23 Q. So as you're sitting here today, your testimony  
24 is I support a 10-foot contingency because we  
25 put a 10-foot contingency in the proposal, and

1 recommendation one way or another; is that  
2 correct?

3 **A. Could you restate that, please.**

4 Q. Well, let me ask you this: I think you said  
5 that you don't have information in front of you,  
6 the data in front of you to determine whether or  
7 not that contingency was reasonable, and as  
8 you're sitting here on the stand today, you  
9 don't have an opinion in that regard because it  
10 sounds like others may have done that research.  
11 Is that a true statement?

12 **A. No, I wouldn't say that others did that  
13 research. I'm saying that right here off the  
14 top of my head, I'm not willing to change that  
15 contingency without looking at the data and  
16 doing an evaluation and determining what -- we  
17 made -- we recommended that contingency with  
18 good reasons, and without reviewing the data and  
19 reviewing Mr. Boese's concerns, if you'd like to  
20 look at it specifically index cell by index  
21 cell, having that discussion, I'm not willing to  
22 make that -- any opinion or -- on what change  
23 would be.**

24 Q. You signed off ultimately on the proposal, is  
25 that a true statement?

1 there's reasons probably for why we put that in  
2 the proposal. Is that your testimony?

3 **A. My testimony is that, yes, that we identified  
4 risks and incorporated the concerns of the  
5 concerned parties and developed a 10-foot  
6 contingency which we put in the proposal.**

7 Q. Yesterday there was a discussion regarding at  
8 least some of the index cells and a discussion  
9 regarding how the drop in the index cell would  
10 be less than -- than 10 feet or less than the  
11 contingency that was added in the proposal. Do  
12 you recall that discussion?

13 **A. I do recall that discussion.**

14 Q. So at least with respect to the index cells  
15 where the drop was significantly less than the  
16 identified contingency in the proposal, do you  
17 believe that contingency should be revised for  
18 those index cells?

19 **A. As I said, those contingencies were determined  
20 in the process of developing the proposal, I do  
21 not -- I'm not -- I have no information here  
22 that indicates I would be willing to recommend a  
23 reduced contingency anywhere.**

24 Q. In other words, you don't have any information  
25 in front of you that allows you to make a

1 **A. I did.**

2 Q. Okay. You have the proposal in front of you,  
3 it's in the black notebook.

4 **A. Yes.**

5 **MR. STUCKY:** Madam Hearing Officer,  
6 I would ask to allow the witness to have a  
7 few minutes to refresh his memory in this  
8 regard on the contingency so he can answer  
9 my questions.

10 **PRESIDING OFFICER:** That's fine.

11 **A. Madam, I don't have the ability to do this  
12 analysis sitting here at the table. This is a  
13 time-consuming analysis, there's nothing in the  
14 proposal that's going to allow me to change my  
15 opinion sitting here today.**

16 **PRESIDING OFFICER:** So that's  
17 different. If this cannot refresh his  
18 memory, then there isn't reason for him to  
19 review it.

20 **A. We would love to sit down, take a look at the  
21 data again, it's been several years since we put  
22 this proposal together, we'd want to sit down  
23 with Mr. Boese and discuss his concerns on  
24 particular index cells, it would be a several  
25 week process. To make any change.**

Page 1166

1 **PRESIDING OFFICER:** And so you're  
 2 asking him to review it as though it can  
 3 refresh his memory, and you're talking  
 4 about a new analysis, so you're talking  
 5 about two different things.  
 6 **A. Yeah.**  
 7 **BY MR. STUCKY:**  
 8 Q. So as you're sitting here today and we're  
 9 testifying in the hearing, in the live hearing,  
 10 there's nothing that you can look at that can  
 11 help to refresh your memory and explain to you  
 12 why this contingency was a defensible number?  
 13 **A. I believe I've already testified that it was a**  
 14 **defensible number due to the risks that were**  
 15 **identified and concerns of the concerned parties**  
 16 **and we arrived and settled on a 10-foot**  
 17 **contingency. If we want to change that**  
 18 **contingency, we would need to sit down with all**  
 19 **of those concerned parties again and look at the**  
 20 **data a second time and review those risks and**  
 21 **reevaluate, but I don't --**  
 22 Q. I'll rephrase my question: As you're sitting  
 23 here today, you don't recall the specifics of  
 24 the rationale and what those concerns were  
 25 that -- the genesis of changing from a 5-foot

Page 1167

1 contingency to a 10-foot contingency; is that  
 2 true? And if you don't recall, that's fair.  
 3 **A. I -- no, I do not recall the specific concerns.**  
 4 Q. And if I'm to ask you how that 10-foot  
 5 contingency was calculated or determined, as  
 6 you're sitting here today, you don't recall  
 7 exactly how it was done, you would have to look  
 8 at some numbers and do some new calculations; is  
 9 that right?  
 10 **A. I -- I recall it was an extensive process that**  
 11 **took weeks at the time, and I obviously can't do**  
 12 **that sitting here.**  
 13 Q. Well, can you explain what that process was to  
 14 arrive at that 10-foot contingency calculation?  
 15 **A. I believe I did that about five minutes ago.**  
 16 Q. And maybe I was unclear, can you explain how it  
 17 was calculated?  
 18 **A. We calculated the water levels, we -- with the**  
 19 **model, through the model runs, we evaluated the**  
 20 **water level fluctuations, we looked at**  
 21 **variability in the aquifer, we looked at**  
 22 **variability of pumping. We developed numbers**  
 23 **through that process, we sat down with GMD, and**  
 24 **I believe DWR was at the conversation as well,**  
 25 **and reviewed the process that we had used and**

Page 1168

1 **the things that we had evaluated.**  
 2 **I believe -- I'm aware that Mr. Boese**  
 3 **brought up some concerns that he had; I -- I**  
 4 **honestly don't remember who else was at the**  
 5 **meeting and who else brought up concerns. At**  
 6 **that point, we arrived upon, due to these other**  
 7 **concerns, do you think we should make that a**  
 8 **larger contingency? We went back, considered**  
 9 **those concerns, and agreed with that statement**  
 10 **and went ahead and set the contingency.**  
 11 Q. A moment ago, you indicated that if Mr. Boese is  
 12 now recommending a 5-foot contingency, let's  
 13 say, for example, or a different contingency,  
 14 you said what one would have to do is Burns &  
 15 Mac would have to spend a couple weeks, have a  
 16 dialogue with the District, reevaluate that  
 17 contingency, and determine what a reasonable  
 18 number is. Was that your testimony in that  
 19 regard?  
 20 **A. Something along those lines.**  
 21 Q. So as you're sitting here today, if the GMD  
 22 testifies and gets on the stand and indicates  
 23 that a different contingency is appropriate, do  
 24 you think that would be a useful exercise to  
 25 engage in?

Page 1169

1 **A. If -- if changes are required, we would**  
 2 **certainly want to engage in that discussion.**  
 3 Q. So are you suggesting that Mr. Boese recommended  
 4 that the City lower the minimum index levels?  
 5 **A. Mr. Boese suggested that we add the contingency.**  
 6 Q. Or on the other hand --  
 7 **A. Which would have the effect of lowering the**  
 8 **index levels.**  
 9 Q. Or on the other hand, was Mr. Boese and his  
 10 staff just helping with the model prior to the  
 11 City even considering submitting a proposal?  
 12 **A. No. These were discussions where the proposal**  
 13 **was being developed and we were meeting with**  
 14 **Mr. Boese to discuss the aspects of the proposal**  
 15 **with him ahead of time so it would not be -- he**  
 16 **would be aware of the contents of the proposal**  
 17 **prior to us submitting it.**  
 18 Q. I'm going to move on. Yesterday we had a  
 19 discussion about saturated thickness and what  
 20 saturated thickness means.  
 21 **A. Uh-huh.**  
 22 Q. Do you recall that discussion?  
 23 **A. Yes.**  
 24 Q. And Mr. Clement gave a definition of saturated  
 25 thickness, do you recall that definition?

1 **A. Yes.**

2 Q. In a general sense, do you agree with his  
3 definition of saturated thickness?

4 **A. Yes.**

5 Q. In other words, just to make this quite simple,  
6 he indicated that if bedrock was 100 feet down  
7 and the water -- and the water level was at zero  
8 essentially, there would be 100 feet of  
9 saturated thickness. Do you recall, in a basic  
10 sense, that discussion?

11 **A. Yes.**

12 Q. And do you also recall what Mr. Clement said  
13 yesterday that if in that same example for  
14 50 feet of that 100 feet there was clay layers,  
15 there would only be a practical saturated  
16 thickness of only 50 feet? Do you recall that  
17 discussion as well?

18 **A. That was Mr. Clement's testimony about the  
19 definition of practical saturated thickness.**

20 Q. Would you also agree that there's a difference  
21 between saturated thickness and practical  
22 saturated thickness?

23 **A. Yes.**

24 Q. And would you also agree that determining a  
25 practical saturated thickness is best determined

1 **A. In the drought modeling is what you're referring  
2 to?**

3 Q. That's correct.

4 **A. No, we did not.**

5 Q. I'd ask that you turn to figure 16 in the City's  
6 proposal. It's on page 4-6.

7 **A. Oh, yes.**

8 Q. Yesterday when you were testifying, you talked  
9 about that graph -- graphical depiction of the  
10 difference, I believe, between what ASR would  
11 look like and what AMC accounting would look  
12 like. Is that what that graph shows?

13 **A. Yes.**

14 Q. And at least in the initial years, I believe,  
15 that are shown on this map, what you testified  
16 to was that the lines graphically are very close  
17 to each other. Is that what you testified to?

18 **A. Yes.**

19 Q. I'd ask now that you focus in on the year 2015.

20 **A. Okay.**

21 Q. At least with respect to the year 2015, can you  
22 read in that blue chart what the actual  
23 cumulative physical recharge credits earned in  
24 acre-feet was for that year?

25 **A. Yes, the actual cumulative physical recharge**

1 by looking at individual well logs?

2 **A. You have to do that, yes.**

3 Q. And would you also agree that at least in this  
4 case as it relates to the City's proposal, you  
5 did not look at any individual well logs, you  
6 personally?

7 **A. No, I looked at individual well logs many times.  
8 The saturated thickness that this discussion was  
9 centered around is the saturated thickness, the  
10 average saturated thickness of an index cell,  
11 which is a four-mile-square area. So within  
12 that, you would expect changes in the saturated  
13 thickness and the practical saturated thickness  
14 in locations.**

15 Q. Well, here's my question: Did you look at  
16 individual well logs within the given index cell  
17 to determine if the data that was created by the  
18 modeling matched up to the actual well logs  
19 within those index cells?

20 **A. Could you ask that again, please.**

21 Q. My question is did you look at individual well  
22 logs within an index cell to determine whether  
23 or not that measured data of the individual well  
24 logs matched up with the modeled results that  
25 were given?

1 **credit earned for 2015 was 4,978.2 acre-feet.**

2 Q. Now, in the green portion of that chart, it  
3 depicts what would be the amount accumulated  
4 under the aquifer maintenance credit accounting  
5 method. Is that a true statement?

6 **A. That is true.**

7 Q. What is shown in 2015 for aquifer -- for the  
8 aquifer maintenance credit accounting method?

9 **A. 5,866.92 acre-feet.**

10 Q. And just so I understand, there's a difference  
11 of approximately, let's say, 900 acre-feet  
12 between those two numbers?

13 **A. I would agree with that.**

14 Q. So at least for the year 2015, would you say  
15 that there's a significant difference between  
16 the accounting methodology for ASR, with a  
17 physical recharge credit, versus the accounting  
18 method for an AMC?

19 **A. I would agree with that, but as you just stated,  
20 it matches very well at lower water levels. In  
21 2015, we had the highest water levels that this  
22 evaluation was completed for.**

23 Q. So in other words, when there's a higher water  
24 level, the correlation isn't as good; is that  
25 correct?

Page 1174

1 **A. That's correct, at higher water levels, we have**  
 2 **more physical recharge losses due to the water**  
 3 **levels.**  
 4 Q. And, in fact, if you look at 2014, there's --  
 5 there's also a difference of approximately,  
 6 what, about 200 acre-feet difference between the  
 7 two in 2014?  
 8 **A. Approximately 200 feet, yes.**  
 9 Q. Yeah, 240 acre-feet, I guess, to clarify the  
 10 record. So at least in 2014, there was also a  
 11 difference in acre-feet between the two  
 12 accounting methods; is that right?  
 13 **A. That's correct.**  
 14 Q. So what we see in this chart is as the water  
 15 table increases, there's -- there's divergence  
 16 in the correlation between the two accounting  
 17 methods; is that correct?  
 18 **A. Yes.**  
 19 Q. I tried to take careful notes of your testimony  
 20 yesterday, and I believe that you said that, in  
 21 your testimony yesterday, that some water  
 22 migrates out, and there's a percentage of the  
 23 water retained when there's a credit, a physical  
 24 credit put into the aquifer. Was that your  
 25 testimony?

Page 1175

1 **A. I don't remember it word for word, but when**  
 2 **physical recharge credits are injected at low**  
 3 **water levels or at high water levels, yes,**  
 4 **there's migration and there is a credit loss.**  
 5 Q. And my notes said that you indicated that  
 6 there's about 80 to 85 percent of that water  
 7 that's actually retained. Does that sound like  
 8 your testimony?  
 9 **A. No, that's incorrect. The overall percentage of**  
 10 **water that has been retained for the duration of**  
 11 **the product -- project, excuse me, is between 80**  
 12 **and 85 percent.**  
 13 Q. In front of you should be some white notebooks,  
 14 and I would ask that you --  
 15 **MR. STUCKY:** May I approach the  
 16 witness?  
 17 **PRESIDING OFFICER:** Uh-huh, yes.  
 18 **BY MR. STUCKY:**  
 19 Q. Exhibit 75.  
 20 **A. We had that out yesterday. Do you know what**  
 21 **volume it is?**  
 22 Q. No. Here you go.  
 23 **A. Thanks. Exhibit 75, you said?**  
 24 Q. Yeah.  
 25 **A. Was there something in particular you wanted me**

Page 1176

1 **to look at?**  
 2 Q. Yeah, have you made it to Exhibit 75, then?  
 3 **A. I have, yes.**  
 4 Q. Now, Exhibit 75, that was introduced yesterday  
 5 into evidence, and you would agree that that's  
 6 an accounting report?  
 7 **A. No, that is an excerpt from an accounting**  
 8 **report.**  
 9 Q. Okay. And at least with this excerpt of the  
 10 accounting report -- well, if we were to look at  
 11 an actual accounting report, it would be much  
 12 thicker. Is that a true statement?  
 13 **A. Yeah, they're 500 pages long.**  
 14 Q. Okay. So this excerpt of an accounting report,  
 15 although still relatively thick, is a condensed  
 16 version of your actual accounting report,  
 17 correct?  
 18 **A. Yeah, it looks like it's the accounting report**  
 19 **without the supporting appendices. The text is**  
 20 **here.**  
 21 Q. In this accounting report, can you tell me how  
 22 many acre-feet it shows of recharge from 2006 to  
 23 2016 in this excerpt? If you could go to  
 24 page 2-4 --  
 25 **A. Yeah.**

Page 1177

1 Q. -- of that report.  
 2 **A. I was getting there. Was your question the**  
 3 **total volume recharged throughout the life of**  
 4 **the project?**  
 5 Q. That's correct, from 2006 to 2016, how much was  
 6 actually -- how many acre-feet were actually put  
 7 in the ground based on the recharge project?  
 8 **A. Table 2.3, the far right column on page 2-4, the**  
 9 **total volume recharged was 9,844.91 acre-feet.**  
 10 Q. Now, that number wouldn't correlate or directly  
 11 correspond to the total recharge credits that  
 12 were received between 2006 and 2016; is that  
 13 right?  
 14 **A. No, that is not an accounting of the recharge**  
 15 **credits that were calculated and received.**  
 16 Q. So in other words, there's a difference between  
 17 the total amount of acre-feet that was put in  
 18 the ground and the acre-feet of credits that  
 19 were received by the City; is that right?  
 20 **A. Yes.**  
 21 Q. Do you know between 2006 and 2016, based on the  
 22 accounting done by the City, what the total  
 23 number of acre-feet in recharge credits was?  
 24 **A. Should be the last page here or --**  
 25 Q. I'd ask you to flip to 4-10 in that exhibit.

1 **A. It's in here twice. Yeah, the calculated**  
2 **recharge credit for 2016 was 6,372.2.**  
3 Q. What number do you get when you divide 6,372.2  
4 divided by 9,844.91, do you know what number you  
5 get?  
6 **A. Give me a calculator and I'll tell you but I**  
7 **don't -- I can't do that math in my head sitting**  
8 **here, sorry.**  
9 Q. Do you have your cell phone on you?  
10 **A. I do.**  
11 Q. Does it have a calculator on it?  
12 **A. Yes, it does.**  
13 Q. Could you pull out the calculator on your cell  
14 phone and run that calculation for me?  
15 **A. If I did the math right, 6,372.2 divided by**  
16 **9,844.91 is 64.7 percent.**  
17 Q. So in other words, at least during the years  
18 2006 to 2016, would it be your testimony that  
19 only approximately 64 percent of the water that  
20 was actually injected into the aquifer was  
21 retained as a recharge credit?  
22 **A. Based on those numbers, yes. And I realize what**  
23 **my mistake is, and I would like to correct it if**  
24 **you'll allow.**  
25 Q. I will allow you to correct the mistake.

1 question, you have seen the 2017 annual  
2 accounting report for the ASR project, correct?  
3 **A. Yes, I have.**  
4 Q. Having reviewed the 2017 annual accounting  
5 report, would you agree, at least, with me that  
6 that percentage has dipped even further below  
7 64 percent?  
8 **A. I really can't say without doing the math again**  
9 **on 2017. I suspect it's somewhere in that range**  
10 **or even slightly lower.**  
11 Q. Without having to go through that process again  
12 where you pull out your calculator, if I were to  
13 tell you that that percentage is now 63.4  
14 percent, would you have reason to disagree with  
15 what my calculations would be if I did the same  
16 kind of calculation you just performed?  
17 **A. I -- I have no reason to disagree with that.**  
18 Q. So in other words, at least what we've  
19 historically seen is that when water -- 1 gallon  
20 of water is injected into the aquifer, somewhere  
21 in the range of 63 to 64 percent of that water  
22 is actually retained by the City in a credit.  
23 Is that a true statement?  
24 **A. That is what the history shows. And that is**  
25 **caused by the rising water levels moving more**

1 **A. The 80 to 85 percent number is water recharged**  
2 **to the aquifer or diverted to town from 2006 to**  
3 **2017.**  
4 **PRESIDING OFFICER:** I'm sorry, can  
5 you say that again?  
6 **A. The amount of water recharged to the aquifer or**  
7 **diverted to town was -- is 80 to 85 percent. I**  
8 **forgot that my total included that, that was my**  
9 **mistake.**  
10 **BY MR. STUCKY:**  
11 Q. And what's that a percent of when you're  
12 including the water diverted to town?  
13 **A. Water diverted, the percentage of water**  
14 **diverted. Total diverted. It's the amount of**  
15 **water recharged or sent to town divided by the**  
16 **amount of water diverted from the Little Ark**  
17 **River.**  
18 Q. Okay. But you would at least agree that when  
19 we're talking about water that is physically  
20 injected into the aquifer versus the amount of  
21 credits that are retained, that percentage is  
22 closer to 64 percent, you would agree with that?  
23 **A. I would agree with that as of the 2016 report**  
24 **results.**  
25 Q. Have you seen -- well, I know the answer to this

1 **water out of the basin storage area. And the**  
2 **reliance on RB36, which loses 60 percent of the**  
3 **water straight out of the basin storage area**  
4 **when we inject it.**  
5 Q. And with respect to 36, basin storage area 36,  
6 that was left out of the proposal; is that  
7 right?  
8 **A. It is not considered an injection point in the**  
9 **proposal.**  
10 Q. And, in fact --  
11 **A. Or injection with wells in the proposal.**  
12 Q. And, in fact, if Burns & Mac had not  
13 strategically excluded 36 from the report, it  
14 would show a much lower percentage, is that  
15 right, in your report?  
16 **A. Which percentage are you referring to?**  
17 Q. The percentage as far as the leakage on the  
18 water injected?  
19 **A. No. I -- it would be difficult to answer that**  
20 **question because the proposal is based on**  
21 **operations in -- at lowered water levels because**  
22 **the higher water levels are what we're trying to**  
23 **avoid with the proposal, the fact that we can't**  
24 **inject at high water levels. The lower water**  
25 **levels, more is retained in RB36, but I can't**

Page 1182

1 **speak to exact percentages without lots more**  
 2 **numbers and lots more time on my cell phone.**  
 3 Q. So in other words, you'd have to look through  
 4 some numbers again to refresh your memory, do  
 5 some additional calculations before you could  
 6 answer my question; is that true?  
 7 **A. That would be true.**  
 8 Q. Could you flip to page 4-2 of the City's  
 9 proposal?  
 10 **A. The City's proposal. Okay, I'm on page 4-2.**  
 11 Q. Are you on that page 4-2?  
 12 **A. Yes.**  
 13 Q. I'd ask that you look at the second full  
 14 paragraph, could you read for me the very first  
 15 sentence of that second full paragraph?  
 16 **A. During the 2006 to 2015 period, 85 percent of**  
 17 **water recharged to the aquifer has been retained**  
 18 **as a recharge credit, despite rising water**  
 19 **levels.**  
 20 Q. So I'm going to break down this sentence, it  
 21 says, between the years 2006 and 2015, which  
 22 were the same years we just considered. Would  
 23 you agree, first of all, that those are the same  
 24 years we just discussed?  
 25 **A. No, you had me do the calculation for the year**

Page 1183

1 **2016.**  
 2 Q. Okay. The same -- well, so we're talking a  
 3 difference between 2015 and 2016, so if we were  
 4 to insert in the sentence during the 2006 to  
 5 2016 period, would you agree that instead of 85  
 6 percent, we should put something more like  
 7 64 percent in this sentence?  
 8 **A. That -- if we were talking about the 2006 to**  
 9 **2016 period, yes, it would be the 65 percent**  
 10 **number that we just calculated. This sentence**  
 11 **is not referring to that time period.**  
 12 Q. But if it were referring to 2006 to 2016, the  
 13 sentence could read that 64 percent of water  
 14 recharged to the aquifer has been retained as a  
 15 recharge credit, despite rising water levels, we  
 16 could revise that percentage, is that your  
 17 testimony?  
 18 **A. I think we just calculated that, yes.**  
 19 Q. Can you point to me or do you have in front of  
 20 you the 2015 annual accounting that would allow  
 21 you to determine how this 85 percent was  
 22 calculated?  
 23 **A. I have no idea what's in your exhibits to tell**  
 24 **you.**  
 25 Q. I'll move on for now. Would you agree that in

Page 1184

1 your expert report, as it was written, you  
 2 didn't deal with the issue of impairment  
 3 specifically as that terminology is used?  
 4 **A. In the proposal?**  
 5 Q. In your expert report that you submitted?  
 6 **A. Do I still have that in one of these binders?**  
 7 **MR. STUCKY:** May I approach the  
 8 witness?  
 9 **PRESIDING OFFICER:** Yes. Can you  
 10 tell me where to find that? Oh, aren't  
 11 these in the City's binder?  
 12 **MR. STUCKY:** Not the amended one.  
 13 **PRESIDING OFFICER:** Not the amended  
 14 one, okay. If you need this for  
 15 questioning.  
 16 **MR. STUCKY:** It's okay, you can look  
 17 at it.  
 18 **BY MR. STUCKY:**  
 19 Q. Would you agree that, at least in your expert  
 20 report, you don't address the issue of  
 21 impairment specifically?  
 22 **A. It does not look like I do.**  
 23 Q. Would you also agree that, at least in your  
 24 expert report, you don't address the issue of  
 25 water quality?

Page 1185

1 **A. It does not appear to be in here either.**  
 2 Q. Would you also agree that, at least in your  
 3 expert report, you don't identify or address the  
 4 issue of minimum desirable streamflow?  
 5 **A. I would -- no.**  
 6 Q. In other words, you don't --  
 7 **A. I -- I agree with that.**  
 8 Q. Would you also agree that in your expert report,  
 9 you don't address the issue of safe yield?  
 10 **A. I don't believe there was a question talking**  
 11 **about safe yield in my expert report, no.**  
 12 Q. Would you also agree that you don't identify or  
 13 address how the City's proposal would impact the  
 14 public interest in your expert report?  
 15 **A. No, I believe my questions were more technically**  
 16 **oriented.**  
 17 Q. In the expert or -- I'm sorry, strike that  
 18 question. In the proposal, there's a 5 percent  
 19 annual -- I'm sorry, a 5 percent initial  
 20 gradational loss in the proposal. Is that a  
 21 true statement?  
 22 **A. No, your first statement was more correct,**  
 23 **there's an initial 5 percent annual loss, and**  
 24 **then the gradational losses are taken on top of**  
 25 **that.**

1 Q. The gradational loss is 1, 3, and 5 percent  
2 depending on the area within the basin storage  
3 area the index cell is located, is that -- is  
4 that how that was calculated?

5 **A. Correct.**

6 Q. With respect to the 5 percent initial loss --

7 **A. Uh-huh.**

8 Q. -- if we were to look at 20 -- 2006 to 2016 data  
9 where we talked about that 64 percent, would you  
10 agree that the initial loss of 5 percent should  
11 actually be a higher number based on the data  
12 you just looked at?

13 **A. No.**

14 Q. And why is that?

15 **A. The initial loss was computed -- the idea is to**  
16 **keep the aquifer full, that's the objective of**  
17 **the proposal. The -- what we looked at when**  
18 **determining that were when water levels were**  
19 **lower and we could inject 30 million gallons a**  
20 **day. If the water levels were naturally lowered**  
21 **or the City pumped a lot to make space for**  
22 **natural -- or physical recharge, when the water**  
23 **levels are lower, the modeling shows that the**  
24 **amount retained is slightly over 95 percent of**  
25 **what is injected. So the intent with the 5**

1 100 percent full, then we would reach those  
2 minimum index levels at a later time as far as  
3 the impact would go?

4 **A. Yes, if you start with it fuller and pump out of**  
5 **it at the same rate, it will finish at a higher**  
6 **level.**

7 **MR. STUCKY:** May I approach the  
8 witness?

9 **PRESIDING OFFICER:** Yes.

10 **BY MR. STUCKY:**

11 Q. For the record, I am handing the witness  
12 Mr. Boese's phone, which has the 2015 annual  
13 accounting pulled up on the phone. Would you  
14 agree, as you scroll through that exhibit on  
15 Mr. Boese's phone, that that appears to depict  
16 the 2015, or at least the summary or excerpt of  
17 the 2015 annual accounting?

18 **A. It looks like it. Is it okay to enter evidence**  
19 **this way?**

20 Q. I'm not going to introduce it into evidence,  
21 Mr. McCormick, I'm giving it to you only to  
22 refresh your memory. By scrolling through this  
23 2015 annual accounting, can you tell me from the  
24 years 2006 to 2015 what the total amount of  
25 acre-feet of recharge was during that year --

1 **percent was to mimic the actual physical**  
2 **recharge retention rate at a level where we**  
3 **could inject 30 million gallons a day, at water**  
4 **levels in the aquifer where we could inject 30**  
5 **million gallons a day.**

6 Q. So as you're sitting here today, based on the  
7 numbers you reviewed, you don't believe that  
8 that percentage should go down at all?

9 **A. No. That would be penalizing ourselves and**  
10 **taking additional losses for keeping the aquifer**  
11 **full.**

12 Q. And how did you arrive at the 1998 level where  
13 the aquifer is approximately 91 percent full?

14 **A. We have operational and testing data of the**  
15 **recharge wells, and we used that data to see**  
16 **what rates we could inject water into the ground**  
17 **and what the water levels needed to be to allow**  
18 **that rate of injection. When -- we then took**  
19 **those water levels and compared them to water**  
20 **levels from various years and found the water**  
21 **levels that corresponded most closely to those**  
22 **water levels, and 1998 was identified as the**  
23 **best match to what those water levels were.**

24 Q. And would you agree with Mr. Clement's testimony  
25 that if we were to start with the aquifer

1 those years?

2 **A. The total volume recharged was 6,817.97 feet.**

3 Q. Now can you tell me during 2006 and 2015, what  
4 was the total number of acre-feet that was  
5 retained as credits during that same time  
6 period, for the 2015 annual accounting?

7 **A. Looks like 4,978.2.**

8 **PRESIDING OFFICER:** I'm sorry, could  
9 you please repeat the recharge number.

10 **A. First number?**

11 **PRESIDING OFFICER:** Yes.

12 **MR. STUCKY:** 6,817.97 acre-feet were  
13 physically recharged into the aquifer.

14 **PRESIDING OFFICER:** Thank you.

15 **BY MR. STUCKY:**

16 Q. And the number that was retained as credits was  
17 4,978.2 acre-feet. Does that sound right,  
18 Mr. McCormick?

19 **A. Yes.**

20 Q. And if you were to divide 4,978.2 acre-feet  
21 divided by 6,817.97 acre-feet, if I were to tell  
22 you that percentage is 73.02 percent, would you  
23 have reason to disagree with me?

24 **A. I'm assuming you did it on a phone calculator,**  
25 **so I'll assume that the math is correct.**

Page 1190

1 Q. And just as an engineer and as a mathematician,  
 2 I think that you could probably look at those  
 3 numbers and see that that percentage would be  
 4 roughly correct; is that -- is that right?  
 5 **A. Roughly, yes.**  
 6 Q. Now, if we go back to page 4-2 of the  
 7 proposal --  
 8 **A. It says 85 percent.**  
 9 Q. Should that number be 73 percent?  
 10 **A. It looks like it should, yes.**  
 11 Q. Yesterday there was also a discussion about some  
 12 errors that were in the proposal. Do you recall  
 13 that discussion?  
 14 **A. Yes.**  
 15 Q. And just to refresh on what some of those errors  
 16 were, we found an error in the minimum index  
 17 levels, is that one of the errors that was  
 18 identified in the table?  
 19 **A. Which table are you referring to?**  
 20 **MR. STUCKY:** Can I have just a  
 21 moment?  
 22 **PRESIDING OFFICER:** Yes.  
 23 **BY MR. STUCKY:**  
 24 Q. Yeah, we noticed that there were some  
 25 contingency errors in table 2-10, is that a true

Page 1191

1 recitation of the testimony from yesterday?  
 2 **A. There is an error in the number. Now I've**  
 3 **managed to confuse myself. There was not an**  
 4 **error with the proposed minimum index level;**  
 5 **there was an error in the table identifying how**  
 6 **that was calculated.**  
 7 Q. And there was also an error in table 2-5; is  
 8 that -- is that right?  
 9 **A. Yes, that error has been identified and talked**  
 10 **about repeatedly over the last five days of**  
 11 **this.**  
 12 Q. And there was another error that was identified  
 13 with respect to Cheney Reservoir starting at  
 14 110 percent versus 100 percent; is that also  
 15 right?  
 16 **A. Yes. Those errors were identified as typos or**  
 17 **reporting errors. And I would classify the 85**  
 18 **percent that we just discussed and Mr. Boese**  
 19 **calculated at 73 percent as also being a**  
 20 **reporting error.**  
 21 Q. And just now we identified another error that  
 22 was found on page 4-2 of the proposal; is that  
 23 correct?  
 24 **A. That's what I just stated.**  
 25 Q. So my question to you is this: We're

Page 1192

1 discovering errors as this hearing process is  
 2 unfolding. As you're sitting here today and  
 3 having carefully reviewed this entire proposal,  
 4 are you aware of any other errors in the  
 5 proposal?  
 6 **A. I am not, no. That's why they're being**  
 7 **identified now.**  
 8 **MR. STUCKY:** No further questions at  
 9 this moment.  
 10 **PRESIDING OFFICER:** Ms. Wendling.  
 11 **A. I'm keeping your phone, Tim.**  
 12  
 13 **CROSS-EXAMINATION**  
 14 **BY MS. WENDLING:**  
 15 Q. I believe your CV says you served as a project  
 16 manager for the proposal; is that correct?  
 17 **A. That's correct.**  
 18 Q. What are your responsibilities as the project  
 19 manager?  
 20 **A. Invoicing, tracking, coordinating, scheduling,**  
 21 **that's what --**  
 22 Q. Do you have roles other than serving as a  
 23 project manager?  
 24 **A. I also did significant technical work in the**  
 25 **proposal.**

Page 1193

1 Q. Can you elaborate on that technical work?  
 2 **A. I did all of the groundwater modeling with**  
 3 **MODFLOW.**  
 4 Q. Okay.  
 5 **A. With the assistance of Mr. Clement in some**  
 6 **inputs development.**  
 7 Q. Can you clarify what roles you performed and  
 8 what roles Mr. Clement performed?  
 9 **A. Mr. Clement excels at GIS work, operating the**  
 10 **geographic information system, which is when the**  
 11 **data comes in clipping it to the area of the**  
 12 **model and processing the input files, the**  
 13 **pumping input files to take the large data sets**  
 14 **from DWR and incorporate them into the model.**  
 15 Q. And you did the rest of the work?  
 16 **A. For the most part, yes.**  
 17 Q. In translating the modeling work to the actual  
 18 proposal being the tables and the narrative,  
 19 what role did you play in the proposal as a  
 20 document?  
 21 **A. I mostly took the input data and provided the**  
 22 **output file. I'm trying to remember. I don't**  
 23 **believe I did much of the technical writing at**  
 24 **all in the development of -- of figures or**  
 25 **anything like that.**

1 Q. The figures in the proposal would be based on  
2 the output data you just mentioned?  
3 **A. That is correct.**  
4 Q. But --  
5 **A. Daniel would typically take those, the output**  
6 **files from the model and import those into GIS**  
7 **to overlay to get these nice figures.**  
8 Q. Okay. So Mr. Clement would be responsible for  
9 these tables, the beautiful tables contained  
10 within the proposal?  
11 **A. I believe so. I believe he made the majority of**  
12 **those tables.**  
13 Q. Okay. And do you recall the specific scope of  
14 work Burns & McDonnell was tasked with for this  
15 project?  
16 **A. I do not remember the scope word for word.**  
17 **Basically, it was to evaluate the water levels**  
18 **that would be -- we'd like to lower the '93**  
19 **water levels to, the new proposed minimum index**  
20 **levels, and then to develop the aquifer**  
21 **maintenance concept and an accounting method,**  
22 **simplified accounting method to account for**  
23 **using that AMC concept.**  
24 Q. So prior to being engaged, the City already knew  
25 they wanted to lower the minimum index level?

1 **A. Yeah, there'd been discussions for sometime, I**  
2 **believe, that the '93 index levels were not**  
3 **adequate or appropriate.**  
4 Q. And based on Mr. Clement's testimony, he was  
5 involved in doing a drought reconstruction; is  
6 that correct?  
7 **A. Constructing a 1 percent drought?**  
8 Q. Uh-huh.  
9 **A. Yes, he was involved in that.**  
10 Q. So --  
11 **A. I was involved in discussions as part of that; I**  
12 **didn't do the technical evaluation of that.**  
13 Q. So prior to the 1 percent drought  
14 reconstruction, the conclusion of lowering the  
15 minimum index levels had already been made?  
16 **A. We knew that the '93 water levels needed to**  
17 **be -- were not low enough, were not sufficient**  
18 **for recovering recharge credits.**  
19 Q. And how did you know that?  
20 **A. Just based on the operations of the wells over**  
21 **the previous years, physical data measurements**  
22 **that we've taken, and looking at the estimated**  
23 **water levels for -- under pumping conditions.**  
24 Q. Had those same criteria been looked at during  
25 the Phase II design and planning?

1 **A. I believe they were considered during that time,**  
2 **yes.**  
3 Q. And the minimum index levels were part of the  
4 Phase II -- I and II process and communicated to  
5 the City prior to construction; is that correct?  
6 **A. I believe that the minimum levels were assigned**  
7 **to the Phase I wells initially. My**  
8 **understanding was that they were not intended to**  
9 **be applied to the Phase II initially, but they**  
10 **were left in as a permit condition when the**  
11 **permits were issued.**  
12 Q. So you believe it was an accident that there are  
13 minimum index levels?  
14 **A. I believe that Phase II was not originally**  
15 **intended that there would be limits on it based**  
16 **on the operational data from operating Phase I**  
17 **for a couple years.**  
18 Q. But you were aware of the minimum index levels  
19 prior to Phase II being implemented?  
20 **A. Yes.**  
21 Q. Okay. And at that point in time, did you raise  
22 any concerns that those minimum index levels  
23 were unreasonable?  
24 **A. We did not do the permitting for the Phase II --**  
25 Q. At the time you were planning and getting ready

1 to implement Phase II, did you raise an issue  
2 with the minimum index levels?  
3 **A. We did not say any -- or I did not say anything**  
4 **to -- about it at that time.**  
5 Q. I believe yesterday you said you were involved  
6 with Phase II?  
7 **A. I was.**  
8 Q. Were you involved with the planning of Phase II?  
9 **A. Yes.**  
10 Q. Were you involved with the implementation of  
11 Phase II?  
12 **A. Yes.**  
13 Q. Were you involved with the budgeting for Phase  
14 II?  
15 **A. Yes.**  
16 Q. Do you -- have you served as a project manager  
17 for other projects for the City of Wichita?  
18 **A. Yes.**  
19 Q. Do you -- approximately how much of your time is  
20 spent on projects for clients other than the  
21 City of Wichita?  
22 **A. That varies by year, but I would say, and this**  
23 **is just a guess, but I would say less than --**  
24 **less than 50 percent of my time is spent on**  
25 **Wichita currently. In the past, it has been**

Page 1198

1 more than 50 percent. Overall average would  
 2 probably be less than 50 percent.  
 3 Q. Okay. Going back to the models that you took  
 4 the inputs and put those into the model to find  
 5 the output; is that correct?  
 6 **A. That's correct.**  
 7 Q. And those inputs, that would include the Wichita  
 8 demand projections worked on by Mr. Macey?  
 9 **A. That's correct.**  
 10 Q. The 2011 and 2012 data worked on by Mr. Clement?  
 11 **A. I -- I would have come up with the hydrologic**  
 12 **data. Daniel would have pulled the pumping data**  
 13 **and cropped the selection down to just wells**  
 14 **that are actually in the model. And --**  
 15 Q. When you were coming up with the hydrologic  
 16 data, you are creating that data, or you're  
 17 pulling it from another source?  
 18 **A. I would be getting that from the USGS, NOAA,**  
 19 **National Oceanic Atmospheric Administration, and**  
 20 **GMD2's weather stations and Kansas Geologic**  
 21 **Survey.**  
 22 Q. Were there any other data inputs that needed to  
 23 be added to the model?  
 24 **A. The stream data.**  
 25 Q. And where did you get that?

Page 1199

1 **A. Daniel pulled that from the USGS river gages.**  
 2 Q. Okay. So once the model has these inputs and  
 3 you get the output, was there any analysis of  
 4 those outputs, or was that all Mr. Clement?  
 5 **A. I would have analyzed it from the perspective of**  
 6 **does it look right, do I -- did I double type a**  
 7 **number and we've got too much water coming out**  
 8 **from this location, not enough here, something**  
 9 **happened, making sure the calculations looked**  
 10 **correct, evaluating the running of the model,**  
 11 **but then basically I would give the resultant**  
 12 **water levels over to Daniel and he would do the**  
 13 **analysis.**  
 14 Q. How do you go from, you and Mr. Clement, we'll  
 15 say Burns & Mac, go from the output data and  
 16 that information to the recommendations actually  
 17 contained in the text of the proposal?  
 18 **A. Well, we look at our water level results, and in**  
 19 **this case we were determining how far down the**  
 20 **water was drawn on each index cell based on the**  
 21 **pumping criteria that we put in, so we would**  
 22 **evaluate what those water levels were and --**  
 23 Q. When you say we, can you clarify when it's Burns  
 24 & McDonnell and when it's the City of Wichita?  
 25 **A. Oh, I'm sorry, Daniel and I would sit down**

Page 1200

1 together and look at the maps that he had put  
 2 together, looked at what the resultant water  
 3 levels were, and evaluated the geology and the  
 4 result of each thing for -- to come up with a  
 5 recommendation for the water levels in each  
 6 index cell.  
 7 Q. And those recommendations you then made to the  
 8 City of Wichita?  
 9 **A. We would -- once we were comfortable with our**  
 10 **results, we would review what we had found with**  
 11 **the City of Wichita, let them know what we had**  
 12 **found.**  
 13 Q. So those recommendations initially would not  
 14 have included the contingency?  
 15 **A. We would have added a contingency on at that**  
 16 **time.**  
 17 Q. All right.  
 18 **A. Prior -- prior to our discussions, we would have**  
 19 **said we would recommend a contingency based on**  
 20 **this or this is our recommended level based on**  
 21 **our evaluation.**  
 22 Q. So based on what you're able to remember today,  
 23 when you met with the City to discuss the  
 24 recommended levels, you did have a contingency  
 25 in that initial recommendation?

Page 1201

1 **A. I -- I believe so, yes.**  
 2 Q. And do you recall whether that was 5 or 10 feet?  
 3 **A. I believe the initial contingency was 5 feet. I**  
 4 **believe.**  
 5 Q. Okay. Did you have any role in recommending  
 6 that the 1 percent drought be spread over eight  
 7 years?  
 8 **A. No, I -- I looked at the work that Daniel and**  
 9 **Scott Macey had done to determine what the --**  
 10 **what represented a 1 percent drought and**  
 11 **included Mr. Winchester's report of his**  
 12 **calculations, compared their results and looked**  
 13 **it over to make sure, you know, gut check that**  
 14 **it made sense from that perspective, and then**  
 15 **took their recommendations and used them.**  
 16 Q. In any of your past experience, have you modeled  
 17 a 1 percent drought over eight years for  
 18 planning purposes?  
 19 **A. No, I don't believe I've modeled a 1 percent**  
 20 **drought. The drought -- a 1 percent drought, as**  
 21 **has been explained, has to do with duration and**  
 22 **severity, so specifically an eight-year period**  
 23 **we've used in this case.**  
 24 Q. Can you have a 1 percent drought with a duration  
 25 of anything other than eight years? Or is that

1 outside of your area of expertise?  
2 **A. I would defer to Mr. Winchester to make that.**  
3 Q. Going to the 1998 levels, are the groundwater  
4 levels represented at the end of 1998  
5 representative of average aquifer conditions?  
6 **A. I have not made that analysis, so I couldn't**  
7 **tell you that. The -- the water levels change**  
8 **constantly in the aquifer.**  
9 Q. Okay. Is there data that would show post  
10 development an average aquifer level in that --  
11 **A. That analysis could be done, yes.**  
12 Q. But to your knowledge has not been done?  
13 **A. I am not aware of it.**  
14 Q. Is there any scientific reason to believe that  
15 when the next drought, severe drought occurs the  
16 aquifer would be 91 percent full?  
17 **A. I think that under the current conditions that**  
18 **the aquifer operates and exists that you could**  
19 **pick any number and say that that's a reasonable**  
20 **starting point for the next drought because you**  
21 **don't know when the drought is going to occur**  
22 **and you don't know what the -- what would happen**  
23 **before it, that would be pure ...**  
24 Q. In planning for a drought, to be able to meet  
25 customer demand, would it be prudent to look at

1 Q. Okay. I believe you said the purpose of the  
2 proposal is to keep the aquifer full?  
3 **A. I did say that.**  
4 Q. And so that would be looking similar to, I  
5 believe, is it 2016 levels, if we go to table  
6 4-2 of the proposal? If you look at table 4-2  
7 on page 4-6 of the proposal, we look at the  
8 recharge capacity from the proposed and current  
9 accounting process, correct?  
10 **A. That's correct.**  
11 Q. And you mentioned that 2015 was a year with high  
12 aquifer levels?  
13 **A. That is correct.**  
14 Q. So if the City is successful in keeping the  
15 aquifer high, would we anticipate similar levels  
16 to 2015?  
17 **A. I believe they'd be higher than 2015.**  
18 Q. Okay. And the discrepancies in the actual  
19 accounting or actual recharge -- actual  
20 cumulative physical recharge column compared to  
21 the proposed accounting process, you said -- you  
22 said earlier that difference between those  
23 quantities gets larger as water levels increase?  
24 **A. I did say that, and that's correct.**  
25 Q. So we're anticipating in this proposal a

1 more than one starting condition for the  
2 aquifer?  
3 **A. I think the evaluation can be made that if you**  
4 **start at level X and your water levels drop to**  
5 **level Y and if you start at a water level of X**  
6 **plus 10 feet, it's a reasonable assumption that**  
7 **your finishing water levels will be at Y plus**  
8 **10 feet. You're starting at the same place,**  
9 **taking the same volume out, you're going to get**  
10 **the same drop in aquifer levels, so I believe**  
11 **the evaluation could be made off of -- based off**  
12 **of that depending on where your starting level**  
13 **actually is.**  
14 Q. If all you're looking at is the water level at  
15 the end of a drought?  
16 **A. Uh-huh.**  
17 Q. So if I actually want to look at water quality  
18 or potential impairment, would it be worthwhile  
19 to consider more than one potential starting  
20 point?  
21 **A. Again, I think the changes in the aquifer would**  
22 **be directly related to your starting water level**  
23 **in such a way that you could make that**  
24 **evaluation based on where your water level**  
25 **starts.**

1 scenario where the water levels are higher than  
2 they were in 2015, is it reasonable, then, to  
3 assume that the discrepancy between the actual  
4 cumulative physical recharge credits earned and  
5 the recharge credits calculated with the  
6 proposed accounting system, that difference will  
7 become even larger?  
8 **A. The difference between physical recharge**  
9 **credits?**  
10 Q. The two accounting methods? The accounting  
11 methods as described on table 4-2 on page 4-6?  
12 **A. Yes, I think that is a reasonable assumption**  
13 **that if you continued on with the physical**  
14 **recharge, it would continue to have a larger**  
15 **separation.**  
16 Q. And was the goal of the proposed accounting  
17 process to mirror the results of what would have  
18 actually occurred?  
19 **A. The goal of the proposed accounting method is**  
20 **to -- sort of twofold. The physical recharge**  
21 **losses and the ability to recharge, actually**  
22 **physically put water in the ground goes down as**  
23 **you -- as water levels come up. To avoid**  
24 **pumping a hole and keeping the aquifer at a**  
25 **level that we can inject to increase the City's**

Page 1206

1 recharge credits available, we tried to mimic  
 2 the accounting at the lower levels because we  
 3 see a higher loss and higher penalty when it  
 4 gets full and we can't accumulate recharge  
 5 credits.  
 6 Q. Okay. Have you looked at the aquifer and how it  
 7 responded to the 1930s drought?  
 8 A. Yes.  
 9 Q. And do you have any data on how long it took the  
 10 aquifer to recover from the 1930s drought?  
 11 A. That data exists but I can't quote what it is  
 12 right now.  
 13 Q. Where would I find that data?  
 14 A. I believe the USGS has a number of reports that  
 15 show water level trends and graphs, would be a  
 16 good place to start.  
 17 Q. All right. You mentioned, I believe, yesterday  
 18 that your seal is on the proposal document?  
 19 A. It is.  
 20 Q. What is the significance of your seal being on  
 21 that document?  
 22 A. It means that I have reviewed the work that went  
 23 into this or directly supervised the work that  
 24 went into this and agree that it was done using  
 25 proper methods and properly reports the facts of

Page 1207

1 the analysis that we did.  
 2 Q. And do you, in the course of your work, put your  
 3 seal on a large number of documents?  
 4 A. I do not.  
 5 Q. Okay.  
 6 A. The ones that are required and -- and I would  
 7 estimate that I have sealed on the order of 30  
 8 reports in my career.  
 9 Q. Okay. And that would include the annual  
 10 accounting reports performed every year?  
 11 A. That is correct.  
 12 Q. So what steps do you personally take in  
 13 reviewing the document before attaching your  
 14 seal?  
 15 A. I review the technical work that goes into it, I  
 16 work with the people, overseeing what they're  
 17 doing and discussing their results to make sure  
 18 that they're done appropriately and the methods  
 19 used meet basic engineering methodology  
 20 requirements and criteria.  
 21 Q. Does the quality control process at Burns &  
 22 McDonnell involve reviewing the proposal  
 23 document in this case?  
 24 A. Yes, it does.  
 25 Q. And were you involved in that quality control

Page 1208

1 process?  
 2 A. Yes, I was.  
 3 Q. Are you concerned at all with the number of what  
 4 you characterized as typos in the proposal  
 5 document knowing that it went through a quality  
 6 control process and it has your seal?  
 7 A. It bothers me anytime I find an error or a typo  
 8 or anything like. Bothers me more when I find  
 9 something that was technically wrong, and that  
 10 typically doesn't happen.  
 11 Q. How can we be confident that a difference, say,  
 12 73 percent to 85 percent is not technically  
 13 wrong, that it is only a typo, what assurances  
 14 can we have that that was purely a typographical  
 15 error?  
 16 A. I can assure you sitting here that it was.  
 17 Other than that, other than just you trusting my  
 18 word, I don't know that you -- there is anything  
 19 that you can do.  
 20 Q. How can I be sure that that -- that change, if  
 21 you change the 85 percent down to 73 percent  
 22 does not impact anything else within the  
 23 document?  
 24 A. Well, in that particular case, that's a  
 25 reporting of a figure that doesn't apply to any

Page 1209

1 of the other numbers that are being used within  
 2 it, it's simply reporting of a figure. So --  
 3 Q. So --  
 4 A. -- that particular one --  
 5 Q. -- the errors in table 2-3 or 2-5, those impact  
 6 other aspects of the proposal. What can be done  
 7 to ensure that those were only typographical  
 8 errors and not impacting anything else within  
 9 the proposal?  
 10 A. We can certainly go back and look at the math in  
 11 the tables and cross-check it. And in all  
 12 honesty, the table numbers that have been  
 13 brought up repeatedly in testimony, we have done  
 14 that and gone back and double-checked to make  
 15 sure that it was just a math error, and that is  
 16 what it turned out to be. Or not a math error  
 17 but a typing in the printed document, printed  
 18 table.  
 19 Q. Were you -- I can't remember what you said  
 20 earlier, with regard to Phase II, did you  
 21 perform any modeling in the planning of ASR  
 22 Phase II?  
 23 A. I did not do any modeling for the planning of  
 24 Phase II.  
 25 Q. Okay. Did anyone else at Burns & McDonnell do

1 modeling for Phase II?  
2 **A. After I came to the company in March of 2007, I**  
3 **do not recall any modeling done. Prior to that**  
4 **I can't speak to.**  
5 Q. Before submitting a project as large as Phase  
6 II, do you believe that someone would have done  
7 some modeling?  
8 **A. I would suspect so.**  
9 Q. But you don't recall if that was Burns &  
10 McDonnell or someone else?  
11 **A. I -- I do not recall seeing modeling results**  
12 **from anyone.**  
13 Q. Okay. What involvement did you have with ASR  
14 Phase II if it was not pertaining to modeling?  
15 **A. I supervised the -- some of the test drilling of**  
16 **pilot holes for the wells, I supervised**  
17 **construction and drilling of the actual wells.**  
18 **I assisted with the design of the well houses**  
19 **and the equipment contained in the well houses,**  
20 **supervised development and testing of the wells.**  
21 Q. Are you aware that the performance expectations  
22 for ASR Phase II were revised at some point?  
23 **A. What performance expectations in particular are**  
24 **you referring to?**  
25 Q. The recharge capacity?

1 **A. There were many calculations of the potential**  
2 **recharge capacity evaluated.**  
3 Q. Okay.  
4 **A. There were -- was the initial design based on**  
5 **our -- the pilot testing holes, and then I**  
6 **believe it was revised with the actual flow**  
7 **rates calculated after we tested the wells, once**  
8 **they were installed.**  
9 Q. Okay. So if I had read a headline around April  
10 of 2014 that the performance expectations of  
11 Phase II were cut in half, would that sound  
12 familiar to you?  
13 **A. I don't believe there was any revision that was**  
14 **on that magnitude.**  
15 Q. Okay. Have you heard that the original belief  
16 would have been, of capacity, was 11,000  
17 acre-feet per year?  
18 **A. Phase II was designed to be a 30 million gallon**  
19 **a day -- have a 30 million gallon per day**  
20 **injection capacity. I'm not sure --**  
21 Q. So for Phase II, was it not considered how  
22 much -- how many recharge credits could actually  
23 be earned with Phase II?  
24 **A. You're looking at a different thing when you're**  
25 **putting in the wells and installing them, you're**

1 **looking at maximizing individual recharge**  
2 **capacity and making sure that it meets the goal**  
3 **of a total of 30 million gallons a day to be put**  
4 **in the ground. The amount of recharge credits**  
5 **that you can earn annually depends on the**  
6 **individual year and the number of days operated.**  
7 **I don't -- I don't recall ever having a goal of**  
8 **developing a recharge system that could earn X**  
9 **number of credits in years due to that**  
10 **variability of operating days.**  
11 Q. Okay. And in your opinion, has Phase II of the  
12 ASR project met its intended goal?  
13 **A. Yeah, we -- we exceeded the 30 million gallon a**  
14 **day recharge capacity.**  
15 Q. So if that were the only goal, that -- okay.  
16 Have you done or performed any modeling to  
17 estimate how long it would take the City to  
18 accumulate 120,000 acre-feet in recharge  
19 credits?  
20 **A. I have not run a MODFLOW model for that sort of**  
21 **duration to determine that. I believe we've**  
22 **done back-of-the-napkin type of calculations of,**  
23 **hey, if we got this many every year, how many**  
24 **years would it take.**  
25 Q. Okay. And can you share any more detail of

1 those back-of-the-napkin calculations?  
2 **A. Again, it depends on water levels and**  
3 **conditions, and I don't -- I don't remember any**  
4 **of the numbers off the top of my head, no.**  
5 Q. We talked about recharge basin 36 not being well  
6 suited for recharge due to its location; is that  
7 correct?  
8 **A. We've talked about it not being well suited for**  
9 **accumulating recharge credits due to its**  
10 **location.**  
11 Q. Okay. Now, when we look at recharge basin 1,  
12 does it have a similar issue?  
13 **A. Recharge basin 1 is a nice swimming pool, it**  
14 **does not take water well at all.**  
15 Q. Okay. Did you look at the impact caused by the  
16 proposed pumping identified in table 2.5 -- 2-5?  
17 **A. Yeah.**  
18 Q. And in part of that, did you identify the  
19 potential cone of depression from the pumping  
20 contemplated in 2-5?  
21 **A. Yes.**  
22 Q. And do you recall how large that cone of  
23 depression could be at any given well?  
24 **A. It varies for every well, I couldn't tell you**  
25 **specific numbers for any well.**

Page 1214

1 Q. Do you have a range?  
 2 **A. Not that I could speak to, no, not off the top**  
 3 **of my head.**  
 4 Q. Is there any data to support that it would not  
 5 exceed 660 feet?  
 6 **A. The individual calculations would support or not**  
 7 **support that based on whatever the result of the**  
 8 **numbers were.**  
 9 Q. But those calculations have not been done?  
 10 **A. We've done those calculations, I just don't know**  
 11 **the numbers.**  
 12 Q. Okay. Are those calculations included in the  
 13 proposal?  
 14 **A. There's water level maps in the proposal, I**  
 15 **believe, showing not individual cone of**  
 16 **depressions but overall --**  
 17 Q. Cone of depression is what I'm interested in  
 18 rather than average water level.  
 19 **A. No, I don't believe those are included in the**  
 20 **proposal.**  
 21 Q. Okay. With the ASR project, I understand that a  
 22 portion of the water diverted from the Little  
 23 Arkansas is used in operations to flush  
 24 pipelines, fill tanks, and drain pipelines; is  
 25 that correct?

Page 1215

1 **A. There are losses that occur with that, yes.**  
 2 Q. And do you know the figure on what percentage of  
 3 the water diverted is lost to those  
 4 operational ...  
 5 **A. It varies widely every year due to which wells**  
 6 **are being used or how the water's routed, how**  
 7 **long you can inject, how many times you have**  
 8 **to -- how many times you have to fill the pipe**  
 9 **with recharge water to the well and then shut it**  
 10 **off.**  
 11 Q. Okay. Under the AMC proposal where water is  
 12 diverted from the Little Arkansas, treated, and  
 13 used by the water utility for customers, does  
 14 that operational loss still occur?  
 15 **A. That's the -- or part of the 5 percent loss.**  
 16 Q. Okay. And would the operational loss be the  
 17 same for, we'll say, AMCs versus physical  
 18 recharge?  
 19 **A. Again, that would depend on a number of**  
 20 **operational factors, like how many times you**  
 21 **turn it on and turn it off and how long a**  
 22 **duration you can pump.**  
 23 Q. Pumping meaning it's part of your diversion from  
 24 the Little Arkansas?  
 25 **A. Yes.**

Page 1216

1 Q. So all of those operational losses are in terms  
 2 of diverting it from the Little Arkansas and not  
 3 for injection?  
 4 **A. No. There are losses -- there are losses in the**  
 5 **pipelines after the process -- after the**  
 6 **treatment process is complete, from the high**  
 7 **service pumping station at the discharge point**  
 8 **of the recharge -- or the treatment plant, from**  
 9 **there to the wells, there are additional losses**  
 10 **that are factored in there.**  
 11 Q. Okay. And that is only discharging back to the  
 12 well, you wouldn't have that loss if you  
 13 discharged directly to the City for use?  
 14 **A. I believe there would be some losses diverting**  
 15 **directly to the City, but I think that -- I'm**  
 16 **not sure how they compare to the losses to the**  
 17 **wells.**  
 18 Q. In the work done by Burns & McDonnell, was  
 19 anything done to predict the future chloride  
 20 movement from the Burrton chloride plume towards  
 21 the well field as a result of the lowered  
 22 minimum index levels?  
 23 **A. We did not do any chloride migration modeling,**  
 24 **but the Phase I wells were excluded from the**  
 25 **proposal for the reason of maintaining the**

Page 1217

1 **groundwater barrier along the western edge of**  
 2 **the well field.**  
 3 Q. Did you predict -- well, because you didn't do  
 4 any chloride modeling, so does the previous  
 5 chloride migration work predict the result of  
 6 pumping down the aquifer as proposed in table  
 7 2-5?  
 8 **A. There is a USGS report that is recent, I can't**  
 9 **quote the name or the date, it's in here**  
 10 **somewhere, that talks about lowered water**  
 11 **levels. I don't know if they are specific to**  
 12 **the proposed index levels or not, but it**  
 13 **assesses the chloride migration at varying water**  
 14 **levels in the Wichita well field.**  
 15 Q. Okay. But you don't know if those levels  
 16 contemplated by the USGS in that report are at  
 17 all similar to the levels, the minimum index  
 18 levels proposed?  
 19 **A. I don't know what the -- how the water levels**  
 20 **compare, no.**  
 21 Q. Okay. Did you do any work to understand the  
 22 chloride movement from -- from Burrton chloride  
 23 plume if 120,000 acre-feet of AMCs were  
 24 withdrawn from the aquifer?  
 25 **A. No.**

1 Q. Did you do any work to understand the future  
2 chloride movement from the Arkansas River if the  
3 minimum water was drawn down to the minimum  
4 index level?  
5 **A. We did not model chloride migration. Again,**  
6 **that USGS report, I believe, addresses that.**  
7 Q. The USGS report, you believe, addresses chloride  
8 from both the Burrton chloride plume --  
9 **A. From both the Ark and the Burrton plume.**  
10 Q. And did you incorporate that analysis into your  
11 proposal?  
12 **A. We did not include that report in our -- as an**  
13 **appendix of the proposal.**  
14 Q. Did you do any work to look at the environmental  
15 impact of drawing water -- the aquifer down to  
16 the proposed minimum index level?  
17 **A. What sort of environmental impacts are you**  
18 **specifically talking about?**  
19 Q. Well, for example, would water being drawn down  
20 to the lowered minimum index levels impact  
21 streamflow and cause more days below minimum  
22 desirable streamflow and could that have an  
23 impact on wildlife?  
24 **A. We did not specifically evaluate MDS from that**  
25 **perspective, no.**

1 Q. Have you attempted to quantify the impact of  
2 rainfall on -- I guess quantify natural  
3 recharge?  
4 **A. Yes.**  
5 Q. And where is that data?  
6 **A. That's incorporated into the model, and it**  
7 **causes the changes in -- or is part of the cause**  
8 **of changes in water level within the model.**  
9 Q. Okay. And I believe yesterday we learned that  
10 the precipitation information included in the  
11 model is based on what occurred in 2011 and  
12 2012?  
13 **A. That's correct. And 2010 for the final two**  
14 **years of the model.**  
15 **MS. WENDLING:** Okay. I have no  
16 further questions.  
17 **PRESIDING OFFICER:** It's about  
18 11:00 o'clock, let's take about a  
19 ten-minute break.  
20 (Thereupon, a recess was taken;  
21 whereupon, the following was had.)  
22 **PRESIDING OFFICER:** Okay. We're  
23 back on the record, and I think,  
24 Mr. McLeod.  
25 **MR. MCLEOD:** Yes, I do have some

1 Q. Did you do any analysis of the environmental  
2 impact of drawing the aquifer down to minimum --  
3 proposed minimum index levels?  
4 **A. Not on wildlife or anything like that, no.**  
5 Q. One purpose of the ASR project has been  
6 repurposing the overall ASR to meet customer --  
7 one purpose of the project has been expressed to  
8 meet customer demand during an extreme drought.  
9 And two options have been presented to achieve  
10 that, with one being the proposal as presented  
11 and the second being to intentionally pump a  
12 hole in the aquifer to make room for artificial  
13 recharge. Based on your experience, are these  
14 the only two potential options available to the  
15 City in order to meet customer demands during an  
16 extreme drought?  
17 **A. I know the City has looked at multiple options,**  
18 **but I don't have any direct knowledge of that.**  
19 Q. And is it your belief that the City and the City  
20 alone is responsible for the fullness of the  
21 aquifer?  
22 **A. I believe the City's management efforts have had**  
23 **a significant impact on filling the aquifer. I**  
24 **believe the rainfall probably had something to**  
25 **do with it too.**

1 redirect.  
2  
3 **REDIRECT EXAMINATION**  
4 **BY MR. MCLEOD:**  
5 Q. Mr. McCormick, Mr. Stucky had asked you a  
6 question about is an AMC accumulated when water  
7 is sent to the City, and you agreed that that  
8 was the case. But what else has to be true? I  
9 mean, if the City sends water from the river for  
10 City use when it could have recharged that in  
11 the aquifer, does the City get a credit for  
12 that?  
13 **A. Well, the City has to divert it, pump it, treat**  
14 **it, and then send it down to the City where it's**  
15 **treated again.**  
16 Q. Does the City get a credit whenever it does  
17 that, even if it had space in the aquifer that  
18 it could have put that water in the aquifer?  
19 **A. I'm sorry, I guess I'm not following your**  
20 **question.**  
21 Q. So as asked and answered, the answer suggested  
22 that the City gets an AMC simply for taking  
23 water from the river for direct use, and I'm  
24 asking you is it that simple, or are there more  
25 conditions, are there other things that have to

Page 1222

1 be true before the City gets an AMC for taking  
 2 water from the river for direct use?  
 3 **A. Yes, the river has to be above base flow and**  
 4 **meet the triggering criteria before it can be**  
 5 **diverted. It has to go through the treatment**  
 6 **plant and receive treatment and then it is sent**  
 7 **to the City.**  
 8 Q. And does there also need to be a restriction on  
 9 the City's ability to put that water in the  
 10 aquifer such that --  
 11 **A. Yes.**  
 12 Q. -- the only thing the City can do is take it for  
 13 direct use?  
 14 **A. Yes, the water level has to be high enough that**  
 15 **it cannot physically meet the operational**  
 16 **criteria for physical injection.**  
 17 Q. And under the accounting method for AMCs, is the  
 18 AMC, when one is accumulated, based on the  
 19 quantity that's diverted from the river or the  
 20 quantity of water that is accordingly left in  
 21 the aquifer?  
 22 **A. It's based on what's left in the aquifer.**  
 23 Q. There were a lot of questions about index cell  
 24 12 here in the Halstead area and the water  
 25 levels in that index cell not varying through

Page 1223

1 the modeled period of the eight-year drought.  
 2 Do you know if there are municipal facilities  
 3 within that index cell such as perhaps a  
 4 low-head dam that might affect the supply to  
 5 that index cell from the river?  
 6 **A. Yeah, there's a low-head dam that -- on the**  
 7 **Little Ark and water levels don't fluctuate in**  
 8 **there, in that area. Even during 2011 and 2012,**  
 9 **the water levels in the aquifer and index well**  
 10 **12 only fluctuated about 2 feet over the entire**  
 11 **duration. It just stays full up there. Which**  
 12 **is a good thing.**  
 13 Q. So with respect to the four errors that the  
 14 District has brought to the attention of the  
 15 hearing officer and of record, is one of the  
 16 purposes of coming to a hearing with material  
 17 and affording other parties input, is one of the  
 18 purposes to identify and correct errors?  
 19 **A. Yes.**  
 20 Q. And, similarly, with respect to the comments  
 21 today on errors in some of the ASR accounting  
 22 reports, is one of the reasons that you send a  
 23 copy of that report to the Groundwater  
 24 Management District so that they can review it  
 25 and furnish comments and help identify any

Page 1224

1 issues?  
 2 **A. Yes, it is. I prefer it when nobody finds any,**  
 3 **but that doesn't always happen.**  
 4 Q. With respect to the discussion of contingency,  
 5 and I believe we began the whole thing with  
 6 reference to Mr. Clement's testimony of  
 7 yesterday, do you recall when Mr. Clement was on  
 8 the stand he identified some of the discussions,  
 9 some of the uncertainties of touching on things  
 10 like multi-year flex plans, the individual  
 11 behavior of well users other than the City that  
 12 we cannot know or control, are those the kinds  
 13 of things that are elements in setting a  
 14 contingency?  
 15 **A. Yes.**  
 16 Q. Is it common practice in engineering and  
 17 modeling to use a contingency when you have  
 18 areas of uncertainty that may affect the  
 19 validity of your results?  
 20 **A. Yes, standard practice.**  
 21 Q. And what are the ramifications of setting lower  
 22 index levels here if you don't apply enough  
 23 contingency?  
 24 **A. The potential for having to come back and change**  
 25 **them again.**

Page 1225

1 Q. And so one reason to set a contingency level  
 2 conservatively low would be to avoid having to  
 3 come back to a future hearing if it's not set  
 4 low enough, correct?  
 5 **A. Correct.**  
 6 Q. There was reference, I believe, by Ms. Wendling  
 7 to recharge basin number 1, and you indicated  
 8 that basin does not -- does not take water well.  
 9 Do you know if the City has installed an  
 10 injection well in the same area to address the  
 11 functional issues with that basin?  
 12 **A. Yes, RR05 was installed to essentially replace**  
 13 **RB1, and water is not diverted to RB1 any**  
 14 **longer, and has not been for years.**  
 15 Q. And Ms. Wendling had asked you about all of the  
 16 things that you didn't model with respect to  
 17 drawing water levels down to the proposed new  
 18 low index levels. Is part of the City's  
 19 proposal to draw water levels down to the  
 20 proposed new index levels?  
 21 **A. No.**  
 22 Q. In terms of water levels being pumped down by  
 23 the City and other users to levels below the  
 24 1993 levels, indeed to the proposed lower index  
 25 level, could that happen now under the existing

1 native rights of the City and other users that  
2 have allocations to pump water annually out of  
3 the aquifer?  
4 **A. Yes, they could pump them that low or deeper.**  
5 Q. And really the only thing that we're affecting  
6 with the change in the proposal is whether or  
7 not the City could take credits between the 1993  
8 low limit and the new proposed low limit,  
9 correct?  
10 **A. Correct.**  
11 Q. Any amount of pumping other than credits could  
12 still be taking place on the part of multiple  
13 users, correct?  
14 **A. That is correct.**  
15 **MR. MCLEOD:** I don't have further  
16 questions for the witness on redirect.  
17 **PRESIDING OFFICER:** Mr. Oleen?  
18 **MR. OLEEN:** None by DWR.  
19 **PRESIDING OFFICER:** Mr. Stucky?  
20 **MR. STUCKY:** No further questions.  
21 **PRESIDING OFFICER:** Ms. Wendling?  
22 **MS. WENDLING:** No further questions.  
23 **PRESIDING OFFICER:** This hasn't  
24 happened yet. That being the case,  
25 Mr. McCormick, you're excused. Thank you.

1 obviously need to go back, regroup, and  
2 come back addressing those issues, which  
3 they have not done. And we will renew our  
4 motion to dismiss.  
5 **PRESIDING OFFICER:** Response?  
6 **MR. MCLEOD:** We think that the City  
7 has put adequate information of record, and  
8 we still oppose the motion to dismiss and  
9 also oppose the motion that's stated as a  
10 motion for directed verdict, even though  
11 there's obviously no jury present in this  
12 proceeding.  
13 **PRESIDING OFFICER:** Mr. Oleen?  
14 **MR. OLEEN:** DWR also opposes the  
15 motion for similar reasons that we opposed  
16 the motion to dismiss earlier. I disagree  
17 with counsel for GMD's assertion that the  
18 City needed to prove some of those things  
19 that counsel claims need to be proven. But  
20 even if he is true, there's witnesses of  
21 the DWR that haven't gone yet that may  
22 address some of those items.  
23 Even if those items are not addressed, I  
24 think under the spirit of this type of  
25 administrative proceeding, again, as stated

1 **MR. MCLEOD:** And I would note as  
2 with some of the prior witnesses that we  
3 may also recall him in rebuttal after some  
4 other witnesses have testified.  
5 **PRESIDING OFFICER:** Noted. And,  
6 Mr. McLeod, do you have any other witnesses  
7 to call?  
8 **MR. MCLEOD:** As for the City's case  
9 in chief, we are done.  
10 **PRESIDING OFFICER:** So, Mr. Oleen,  
11 would you like to get started for a little  
12 while before lunch or take an early break?  
13 **MR. OLEEN:** I can get started, Madam  
14 Officer, if I can just have a couple  
15 minutes to clear my space of some of these  
16 books that I was looking through.  
17 **PRESIDING OFFICER:** Certainly.  
18 **MR. ADRIAN:** Madam Hearing Officer,  
19 at this point, the District would ask for a  
20 directed verdict on this matter, and it  
21 would be based upon their failure to  
22 address minimum streamflow, water quality,  
23 effects on other water users, all of those  
24 requirements that they need to meet in its  
25 application that they have not met. They

1 in my opposition to GMD2's previous motion  
2 for summary judgment and motion to dismiss,  
3 that it's not appropriate to end these  
4 proceedings in that procedural way.  
5 **PRESIDING OFFICER:** Ms. Wendling?  
6 **MS. WENDLING:** The Intervenors  
7 support the motion for directed verdict and  
8 motion to dismiss per the grounds stated by  
9 GMD2.  
10 **PRESIDING OFFICER:** In light of the  
11 fact that one of the reasons for this  
12 administrative hearing is for a full  
13 disclosure of facts, for all the parties to  
14 have their say, in effect, for me to have  
15 as much information as absolutely possible,  
16 and to create a complete record for those  
17 who would review this in the future, then  
18 I'm going to deny the motion for directed  
19 verdict. However, as I said at the outset  
20 of the hearing in December, the motion to  
21 dismiss remains pending.  
22 Mr. Oleen.  
23 **MR. OLEEN:** DWR is ready to call its  
24 first witness, Mr. Lane Letourneau. And  
25 I'll have him spell that for you.

Page 1230

1 LANE LETOURNEAU,  
2 having been first duly sworn, was  
3 examined and testified as follows:  
4  
5 **DIRECT EXAMINATION**  
6 **BY MR. OLEEN:**  
7 Q. Mr. Letourneau, would you please state your name  
8 and spell it for the reporter.  
9 **A. Yes, I am Lane Letourneau, L-A-N-E, and**  
10 **L-E-T-O-U-R-N-E-A-U.**  
11 Q. Mr. Letourneau, with whom are you currently  
12 employed?  
13 **A. The Kansas Department of Agriculture, Division**  
14 **of Water Resources.**  
15 Q. And how long -- and what's your current title  
16 with the DWR?  
17 **A. I am the program manager for the water**  
18 **appropriation program.**  
19 Q. And do you recall how long you've held that  
20 position?  
21 **A. Since 2006 so 13 1/2, 14 years.**  
22 Q. And prior to 2006, did you work for DWR in some  
23 capacity?  
24 **A. I've worked for the Division of Water Resources**  
25 **since 1987.**

Page 1231

1 **MR. OLEEN:** Permission to approach  
2 the witness, Your Honor?  
3 **PRESIDING OFFICER:** Yes.  
4 **BY MR. OLEEN:**  
5 Q. Mr. Letourneau, I'm handing you what I will ask  
6 the stenographer to mark for identification as  
7 DWR Exhibit 2.  
8 (DWR Exhibit Number 2 Marked for  
9 Identification.)  
10 **MR. OLEEN:** Here's your copy.  
11 **PRESIDING OFFICER:** Thank you.  
12 **BY MR. OLEEN:**  
13 Q. Mr. Letourneau, I just handed you what has been  
14 marked as DWR Exhibit 2, do you recognize that  
15 document?  
16 **A. I do, yes.**  
17 Q. And is this your CV --  
18 **A. Yes.**  
19 Q. -- curriculum vitae or resume?  
20 **A. Correct.**  
21 Q. And you gave a deposition in this matter back  
22 in, what's the date stated on -- well, let me  
23 back up, excuse me. There's a -- there's  
24 another sticker on that document, does it appear  
25 to be a deposition sticker?

Page 1232

1 **A. Yes.**  
2 Q. And what's the date stated on that deposition  
3 sticker?  
4 **A. March 8, 2019.**  
5 Q. You gave a deposition in the course of these  
6 proceedings at the request of GMD2 and the  
7 Intervenors, correct?  
8 **A. Correct.**  
9 Q. And is that a copy of the CV that you provided  
10 and that was a deposition exhibit at your  
11 deposition?  
12 **A. Yes.**  
13 Q. And this CV, is it generally accurate since it  
14 was used at your deposition, or have there been  
15 significant developments or additions to this?  
16 **A. No -- no additions.**  
17 **MR. OLEEN:** I would move for the  
18 admission of DWR Exhibit Number 2.  
19 **PRESIDING OFFICER:** Any objection?  
20 **MR. STUCKY:** No objection.  
21 **PRESIDING OFFICER:** DWR 2 will be  
22 admitted.  
23 **BY MR. OLEEN:**  
24 Q. Mr. Letourneau, back to your background, do you  
25 have any professional licenses in the State of

Page 1233

1 Kansas?  
2 **A. I am a professional geologist.**  
3 Q. And you stated that you've worked for DWR in any  
4 capacity for a total of how many years?  
5 Roughly?  
6 **A. 33. 32, 33.**  
7 Q. And most recently, you said that that was in the  
8 position of water appropriation program manager;  
9 is that correct?  
10 **A. That's correct.**  
11 Q. And explain for me your key, main duties, if you  
12 will, as program manager for the water  
13 appropriation program.  
14 **A. Well, the program administers what's called the**  
15 **Kansas Water Appropriation Act. We deal with**  
16 **new applications, new applications to**  
17 **appropriate water, changes to existing water**  
18 **rights, certifying permits -- taking permits,**  
19 **certifying them so they're a water right. We**  
20 **have the annual Water Use Report program, and**  
21 **then we also have compliance and enforcement of**  
22 **permits and water rights. Plus we have our four**  
23 **field offices and one regional office in Parsons**  
24 **that does our fieldwork, so that's what we do.**  
25 Q. And there are other programs within DWR,

1 correct?  
2 **A. Correct.**  
3 Q. Another one is water management services  
4 program; is that correct?  
5 **A. Water management services and then there's the**  
6 **structures program.**  
7 Q. And what does the water management services  
8 program do different from the water  
9 appropriation program of which you are program  
10 manager?  
11 **A. The water management services, I refer to them**  
12 **as our technical team basically, they're the**  
13 **modelers and engineers, they deal with**  
14 **interstate water issues, and then the chief**  
15 **engineer is part of that team.**  
16 Q. Is Chris Beightel the current program manager of  
17 the water struc -- or, excuse me, the water  
18 management services program?  
19 **A. Yes, he is.**  
20 Q. Do you recall at some point in this  
21 consideration of the City's -- City of Wichita,  
22 their proposal, the current chief engineer,  
23 David Barfield, decided to hold this formal  
24 administrative hearing, correct?  
25 **A. Correct.**

1 Q. And given the fact that at the point that the  
2 chief engineer decided to hold an administrative  
3 hearing about this matter and, therefore,  
4 withdraw himself and those on his team from  
5 further discussion with DWR officials, you are  
6 the most senior DWR official left on the, quote,  
7 DWR team about this matter; is that correct?  
8 **A. About this hearing, yes.**  
9 Q. And about the proposal at issue?  
10 **A. Yeah, right now, yeah, I would say yes.**  
11 Q. You weren't personally involved back with the  
12 issuance of the current ASR Phase I and Phase II  
13 orders, were you?  
14 **A. The initial ones, no, I was not part of that**  
15 **program. I mean, I have to say I was aware of**  
16 **them, but I wasn't part of issuing them.**  
17 Q. Do you recall, were you water appropriation  
18 program manager at the time?  
19 **A. No, I was not.**  
20 Q. But you generally have some familiar -- some  
21 familiarity, do you or do you not, with the  
22 Phase I order and the Phase II orders?  
23 **A. Yes, yes, absolutely.**  
24 Q. And what is your understanding of the general  
25 concept of Phase I?

1 Q. And at that point, in order to preserve the  
2 independence of the chief engineer as separated  
3 from other DWR officials, a Chinese wall, if you  
4 will, was erected between DWR and the chief  
5 engineer, correct?  
6 **A. The -- a wall was built between the**  
7 **appropriation program and the majority of water**  
8 **management services. We've -- Ginger Pugh on**  
9 **our -- in water management services has become**  
10 **part of our team, but she's the only technical**  
11 **person that we have on our team.**  
12 Q. Okay. And so the chief engineer was walled off,  
13 and isn't it true that he took Chris Beightel,  
14 the program manager of the water management  
15 services program, he took Chris Beightel on the  
16 chief engineer's team --  
17 **A. Yes.**  
18 Q. -- so to speak?  
19 **A. Correct.**  
20 Q. And so is it true that you are the most senior  
21 DW -- well, let me back up, strike that. As  
22 water appropriation program manager, you have  
23 had some involvement with the City of Wichita's  
24 proposal at issue, correct?  
25 **A. Correct, yes.**

1 **A. Well, what I recall about Phase I was really to**  
2 **get the project going, start testing. A big**  
3 **item in Phase I was the Burrton salt plume and**  
4 **to build -- use recharge credits, then, to build**  
5 **up a hydrologic wall to keep the salt plume from**  
6 **migrating.**  
7 Q. And then what's your general understanding of  
8 the subsequent Phase II?  
9 **A. Phase II at the time, what I remember was**  
10 **recharge credits for water supply.**  
11 Q. Now, as part of these formal administrative  
12 hearing proceedings, you submitted a signed  
13 written testimony on behalf of DWR; is that  
14 correct?  
15 **A. Well, on behalf of the water appropriation**  
16 **program, right.**  
17 **MR. OLEEN:** Permission to approach  
18 the witness?  
19 **PRESIDING OFFICER:** Yes.  
20 **BY MR. OLEEN:**  
21 Q. Mr. Letourneau, I'm going to hand you what I  
22 will ask the stenographer to mark as DWR  
23 Exhibit 3.  
24 (DWR Exhibit Number 3 Marked for  
25 Identification.)

Page 1238

1 **MR. OLEEN:** Madam Hearing Officer  
 2 and other counsel, I apologize, I don't  
 3 have copies of this document for everyone,  
 4 but this is -- this is DWR's prehearing  
 5 brief and written testimony as it's titled.  
 6 It has already been judicially noticed, so  
 7 to speak, or accepted into the record by  
 8 previous order of Ms. Owen, and so it's  
 9 perhaps not necessary that it be marked and  
 10 admitted as an exhibit to these  
 11 proceedings, but for potential reference, I  
 12 would ask that it be so admitted.  
 13 **PRESIDING OFFICER:** Any objection?  
 14 **MR. STUCKY:** I don't have any  
 15 objection to the exhibit, but there's been  
 16 a concern identified that our exhibits may  
 17 get voluminous. I will note that that  
 18 particular document is already an exhibit  
 19 that the District --  
 20 **MR. OLEEN:** 77, I believe.  
 21 **MR. STUCKY:** Yeah, 77 is an exhibit  
 22 of the District that we intend to reference  
 23 and intend to use. So my suggestion is  
 24 that we just make it the District's  
 25 Exhibit 77.

Page 1239

1 **MR. OLEEN:** There's -- I understand  
 2 some validity to Mr. Stucky's request, but  
 3 I would prefer DWR's written testimony to  
 4 have a sticker that says DWR on it. That's  
 5 all.  
 6 **PRESIDING OFFICER:** Any other  
 7 comments? I think we'll be able to keep  
 8 clear that it's in two places, if not three  
 9 at once, so I think that's fine, we can  
 10 keep it marked DWR Exhibit 3, then it will  
 11 also be a GMD exhibit.  
 12 **MR. OLEEN:** Thank you.  
 13 **BY MR. OLEEN:**  
 14 Q. So, Mr. Letourneau, looking at what has just  
 15 been admitted as DWR Exhibit 3 --  
 16 **PRESIDING OFFICER:** Pardon me --  
 17 **MR. OLEEN:** Oh, I'm sorry.  
 18 **PRESIDING OFFICER:** -- I have not  
 19 officially admitted it, we just discussed  
 20 about what to call it.  
 21 **MR. OLEEN:** Well, now that we know  
 22 what to call it, I would ask --  
 23 **PRESIDING OFFICER:** Any objections  
 24 to its admission? Hearing none, it's  
 25 admitted.

Page 1240

1 **MR. OLEEN:** Thank you.  
 2 **BY MR. OLEEN:**  
 3 Q. Mr. Letourneau, what I've handed you as DWR  
 4 Exhibit 3, what's been admitted as that, would  
 5 you please briefly look at that and tell me if  
 6 that is indeed your signature at the end and if  
 7 this appears to be the written testimony that  
 8 you previously submitted.  
 9 **A. It is, yes.**  
 10 Q. So, Mr. Letourneau, we talked about your  
 11 understanding of Phase I of the ASR project, we  
 12 talked about your understanding of Phase II.  
 13 We're obviously here today to talk about the  
 14 City's proposal which would have some  
 15 modifications from the Phase II permit  
 16 conditions as the City states. What's your  
 17 understanding was the catalyst for the proposal  
 18 that we're here today to discuss?  
 19 **A. It's my understanding it's when the City started  
 20 looking at this project and repurposing this  
 21 project from water supply to drought mitigation.  
 22 And that -- that's the genesis of the proposal.**  
 23 Q. And as part of this proposal, is it DWR's  
 24 opinion or characterization that there are two  
 25 kind of key elements of this proposal?

Page 1241

1 **A. There are two.**  
 2 Q. And how would you characterize those two key  
 3 requests of the proposal?  
 4 **A. The first one is lowering the minimum index cell  
 5 level in Phase II, and the second one is to  
 6 allow aquifer maintenance credits.**  
 7 Q. And you mention element one, lower the current  
 8 minimum index cell levels, have those also  
 9 occasionally been referred to as the, quote,  
 10 1993 bottoms?  
 11 **A. Currently, yes, it's the '93 bottoms.**  
 12 Q. Is it your under -- what is your understanding  
 13 as to whether or not these two aspects of the  
 14 proposal are mutually exclusive or not?  
 15 **A. They are, they are exclusive.**  
 16 Q. And by that, do you mean to say that only one  
 17 could be approved -- only one could be  
 18 recommended by the hearing officer and perhaps  
 19 approved by the chief engineer, or it would have  
 20 to be both or none?  
 21 **A. I'd have to say either could be -- the permits  
 22 could be modified to allow either one, both or  
 23 either one.**  
 24 Q. Okay. So they're not actually mutually  
 25 exclusive in your understanding?

1 **A. Correct.**

2 Q. Regarding the lowering -- the request to lower  
3 the minimum index cell level, do you -- what's  
4 your -- what's DWR's understanding of why the  
5 City's requesting this?  
6 **A. Well, the City is requesting it so they can**  
7 **leave recharge credits in the aquifer longer.**  
8 **When I was approached in the Capitol -- we were**  
9 **making a modification to the multi-year flex**  
10 **account to make it more amenable to our water**  
11 **users to get signed up to become a drought**  
12 **mitigation tool. An unintended consequence of**  
13 **that was we were operating with a lower water**  
14 **table at the time.**

15 **And Dale Goter was a lobbyist for Wichita,**  
16 **Dale was a friend of mine, and Dale approached**  
17 **me and said, look, the City's pretty concerned**  
18 **about the water levels and the impact that's**  
19 **going to happen, so that's when the wheels**  
20 **started turning about the potential for a lower**  
21 **index. So what could potentially happen is the**  
22 **City could build up recharge credits but then**  
23 **the water level would be so low in the aquifer**  
24 **that they would strand those recharge credits**  
25 **and they couldn't access them when they needed**

1 **them.**

2 Q. And so as a result of that concern, is it your  
3 understanding that Wichita eventually did some  
4 drought modeling?

5 **A. I don't -- I think the drought modeling might**  
6 **have been independent of that. I think -- I**  
7 **remember being on a Kansas geological**  
8 **legislative tour and we went to Cheney and Joe**  
9 **Pajor at the time gave a presentation to that**  
10 **group about the operation of Cheney because that**  
11 **group is interested in Cheney, that's when Joe**  
12 **talked about the modeling, the work that they**  
13 **had done. Cheney evaporates faster than they**  
14 **were using it, and so that's why they shifted,**  
15 **then, to the use of Cheney because they didn't**  
16 **want to lose it to evaporation, if I recall that**  
17 **correctly.**

18 Q. And you're aware of the proposal that we're here  
19 to discuss, correct?

20 **A. Absolutely.**

21 Q. And is it your understanding that the City did  
22 some drought modeling that they believe supports  
23 the proposal that they're requesting be adopted;  
24 is that correct?

25 **A. Yes.**

1 Q. Would you please turn in the black notebook, I  
2 believe the very first tab of that black  
3 notebook of the City's -- is the proposal  
4 itself.

5 **A. I'm there.**

6 Q. Does that appear to be --

7 **A. Yes, it's the third tab.**

8 Q. Okay. Well, I would ask you to turn to, in the  
9 proposal, table 2-3 on page 2-5 of the proposal.

10 **A. I'm there.**

11 Q. Okay. And so this table 2-3, you've reviewed  
12 this table 2-3 before; is that correct?

13 **A. Many, many times and this table was one of my**  
14 **talking points --**

15 Q. Okay.

16 **A. -- when I talked to folks.**

17 Q. And what would you talk to folks when you would  
18 explain this table 2-3?

19 **A. The biggest --**

20 Q. As far as what it shows?

21 **A. Okay. The biggest concern that I always heard**  
22 **about was impairment, the City pumping 120,000**  
23 **acre-feet, and so I would refer to the demand on**  
24 **the Equus Beds well field and aquifer storage**  
25 **and recovery, that particular line. And I would**

1 **explain to people that that's the projections of**  
2 **the City, that's what -- that's what they need**  
3 **in the 1 percent drought based on these modeling**  
4 **projections.**

5 Q. And when you say what they need, what are you  
6 referring to?

7 **A. What they need from the well field.**

8 Q. In terms of recharge credits or what?

9 **A. Both, it's native water rights and recharge**  
10 **credits. That's the total need from the well**  
11 **field.**

12 Q. Okay. And you've been sitting here throughout  
13 these proceedings, we're on day four total of  
14 these proceedings; is that right?

15 **A. (Witness nods head affirmatively.)**

16 Q. And so that line item that you referred to, City  
17 demand assigned to EBWF and ASR, were you here  
18 when there was some discussion that that line is  
19 the number of recharge credits and potentially  
20 also native water rights, acre-feet of native  
21 rights to the extent any number in that line is  
22 over 40,000 feet -- 40,000 acre-feet, excuse me?

23 **A. Well, the native rights are 40,000 acre-feet, so**  
24 **anything above 40,000 acre-feet would have to**  
25 **come from recharge credits.**

Page 1246

1 Q. Okay. And so do you recall, I believe there's  
2 been some discussion, if one does the math, to  
3 determine how many recharge credits would be  
4 used, according to this table, at the end of  
5 drought year five, do you recall roughly what  
6 that number of recharge credits was?  
7 **A. Yeah, it's a little less than 51,000 acre-feet.**  
8 **50,800 or something like that.**  
9 Q. Okay. And so you just -- you just testified  
10 that you had heard concerns about the number  
11 120,000 acre-feet of recharge credits; is that  
12 correct?  
13 **A. Absolutely.**  
14 Q. So are you saying -- what would you tell people,  
15 then, if -- well, let me back up. You said you  
16 would refer to this table in the course of  
17 explaining the City's proposal, right?  
18 **A. Yes.**  
19 Q. And so you just said that according to this  
20 table, something less than 51,000 acre-feet of  
21 recharge credits are anticipated to be used at  
22 the end of drought year eight; is that correct?  
23 **A. Correct.**  
24 Q. So would you explain that to people in relation  
25 to their concerns over 120,000 acre-feet or not?

Page 1247

1 **A. Yes.**  
2 Q. And how would you explain that?  
3 **A. Because the concern was that I would hear, the**  
4 **City's going to pump their 40, they're going to**  
5 **pump 120, and then even another individual, they**  
6 **said they're going to pump their 19 -- the City**  
7 **today is approved to pump 19,000 of recharge**  
8 **credits if they have that in their account. And**  
9 **they don't have -- they don't have that in their**  
10 **account yet. I think I heard Paul McCormick**  
11 **earlier say they've got about 6,000. So -- but**  
12 **there was a lot of concern about the City**  
13 **pumping their native water rights and 120 and**  
14 **then their recharge.**  
15 **So I would refer to this table to try to**  
16 **actually show what the City's projected demands**  
17 **are. And then at the end, I would say at the**  
18 **end of the 8 percent (sic) drought, it's**  
19 **approximately 51,000 recharge credits if the**  
20 **City accumulated them.**  
21 Q. In the course of coming up with this table 2-3,  
22 the City engaged in -- or hired some people to  
23 perform some modeling work, right?  
24 **A. Correct.**  
25 Q. And you're not a modeler, right?

Page 1248

1 **A. No.**  
2 Q. I would ask you to turn in -- there's a white  
3 volume underneath the white binder that's open,  
4 I believe.  
5 **A. This one?**  
6 **MR. OLEEN:** Permission to approach  
7 the witness?  
8 **PRESIDING OFFICER:** Uh-huh, yes.  
9 **A. Voila.**  
10 **BY MR. OLEEN:**  
11 Q. Mr. Letourneau, I'll ask that you turn to what  
12 has already previously been marked and admitted  
13 into the record as City's Exhibit 24. And --  
14 **MR. STUCKY:** What was the City's  
15 Exhibit 24?  
16 **MR. OLEEN:** City's Exhibit 24 is a  
17 letter from Chief Engineer Barfield to the  
18 City dated September 18, 2017. And I  
19 actually have other copies I will provide.  
20 **PRESIDING OFFICER:** Thank you.  
21 **MR. OLEEN:** I would ask the  
22 stenographer to please mark this, I believe  
23 we're on DWR Exhibit 4.  
24 (DWR Exhibit Number 4 Marked for  
25 Identification.)

Page 1249

1 **PRESIDING OFFICER:** Do you have one  
2 for Ms. Wendling?  
3 **MR. OLEEN:** Oh, sorry.  
4 **MS. WENDLING:** Thank you.  
5 **BY MR. OLEEN:**  
6 Q. Mr. Letourneau, if you would please compare DWR  
7 Exhibit 4 with City Exhibit 24, do those appear  
8 to be the same letter?  
9 **A. They're the same letter with the exception of**  
10 **yours being on letterhead.**  
11 Q. Right. And that's why I wanted this one in the  
12 record. I don't know why the other version  
13 doesn't have that, but does this appear to be a  
14 letter -- well, written by whom, who does this  
15 DWR Exhibit 4 appear to be written by?  
16 **A. Well, it was signed by the chief engineer, but**  
17 **it was written by a team of us.**  
18 Q. Okay. And was this letter dated September 18,  
19 2017?  
20 **A. September 18th, 2017, correct.**  
21 Q. And if you just eyeball for a few seconds DWR  
22 Exhibit 4 with City Exhibit 24, do they appear  
23 to be the same document, just one is missing a  
24 letterhead for some reason?  
25 **A. Yes. Yeah.**

1 Q. At the bottom of what has been marked DWR  
2 Exhibit 4, you are a person who was cc'd on this  
3 letter, correct?  
4 **A. I am, correct.**  
5 Q. And you -- do you recall this letter?  
6 **A. Yes.**  
7 **MR. OLEEN:** I would ask for the  
8 admission of DWR Exhibit 4 into the record.  
9 **PRESIDING OFFICER:** Any objection?  
10 DWR 4 will be admitted.  
11 **BY MR. OLEEN:**  
12 Q. Mr. Letourneau, we were talking about modeling  
13 before we started talking about this exhibit,  
14 and you explained that you're not a modeler,  
15 correct?  
16 **A. That's correct.**  
17 Q. But other people with DWR are; is that correct?  
18 **A. That's correct.**  
19 Q. And what's your opinion of the chief engineer's  
20 knowledge of modeling, if you have one?  
21 **A. The chief engineer has a thorough knowledge on**  
22 **how models work based on his experience.**  
23 Q. I would like to direct your attention to the  
24 second page of DWR Exhibit 4, and I'd like you  
25 to read the paragraph that starts with first, as

1 just read back then summarized the chief  
2 engineer's opinion as to the model that the  
3 City's used in this proposal?  
4 **A. Yeah, but I have to add to this mix is Sam**  
5 **Perkins, who has a Ph.D., is a modeler, and also**  
6 **Chris Beightel reviews it, so it's a team of**  
7 **modelers that felt that this was sufficient.**  
8 Q. And would it be fair to say that that was DWR's  
9 official position at that time with respect to  
10 the model that the City's used in their  
11 proposal?  
12 **A. Yes.**  
13 Q. And you're not a modeler, but is this still  
14 DWR's position at this time with respect to the  
15 City's model?  
16 **A. Yes. And then I have to add, we also know that**  
17 **we're -- in talking to the City of Wichita and**  
18 **they asked us the question if it was sufficient;**  
19 **and if this group did not feel it was**  
20 **sufficient, Wichita could afford to do another**  
21 **model, so that's why we felt that it was**  
22 **sufficient.**  
23 Q. So I want to talk more now about this first  
24 aspect of the proposal, which is lowering the  
25 minimum index cell levels. What's your

1 an introductory matter. Do you see where that  
2 is?  
3 **A. I do.**  
4 Q. Would you please read that entire paragraph into  
5 the record.  
6 **A. Entire paragraph. First, as an introductory**  
7 **matter, let me thank the City for its detailed**  
8 **work responsive to my request that the City**  
9 **demonstrate and establish reasonable bottoms to**  
10 **the basin storage area which meet both the needs**  
11 **of the City for the ASR project and assure the**  
12 **public that the ASR can be operated without**  
13 **raising significant water supply concerns from**  
14 **others accessing the aquifer. From our review**  
15 **of the draft report, it appears the City's**  
16 **methods are sufficient for this purpose. While**  
17 **there are no perfect models, we believe the**  
18 **existing model is sufficient for this purpose.**  
19 **It also appears the City's assumptions and data**  
20 **are sufficient as used in this analysis.**  
21 Q. So this letter was sent by the chief engineer  
22 back in 2017 before the initiation of these  
23 formal proceedings; is that correct?  
24 **A. That's correct.**  
25 Q. Is it your understanding that the paragraph you

1 understanding of what the modeling that has been  
2 done by the City and as reported in their  
3 proposal, what's your understanding of what the  
4 City's modeling has showed with respect to the  
5 new proposed minimum index cell levels?  
6 **A. Well, another talking point, two more talking**  
7 **points that I would use, figures 10 and 11, I**  
8 **believe, let me get there. Figures 10 and**  
9 **figures 11, the --**  
10 Q. Of what?  
11 **A. Of the proposal, of the City's proposal.**  
12 Q. Okay. And so what's your understanding of what  
13 figures 10 and 11 show with respect to the  
14 proposal?  
15 **A. It's my understanding that figure 10 shows the**  
16 **conditions of the aquifer after stress period**  
17 **eight, after the eighth year of the drought,**  
18 **I'll say, the period that they ran in that first**  
19 **table.**  
20 Q. The modeled drought simulation?  
21 **A. The model, correct, the model.**  
22 Q. And then what's your understanding of figure 11?  
23 **A. That, I believe, was with the contingencies that**  
24 **they were -- that folks have talked about**  
25 **earlier.**

Page 1254

1 Q. So is it your understanding that figure 10 shows  
 2 average aquifer condition percent full by index  
 3 cell after the end of the simulated eight-year  
 4 drought with the City model?  
 5 **A. Correct.**  
 6 Q. And is it your understanding that figure 11  
 7 shows something similar but different in that  
 8 it's not after the end of the eight-year-model  
 9 simulated drought but, rather, if the water  
 10 levels actually dropped to the proposed -- all  
 11 the way down to the proposed new bottoms?  
 12 **A. Yeah, this is, I believe, the eight-year drought**  
 13 **with the contingency added on, so these are the**  
 14 **proposed new bottoms.**  
 15 Q. And as part of the program manager for the water  
 16 appropriation program, you -- is it true that  
 17 you head the department in charge of change  
 18 applications, for example?  
 19 **A. Yes.**  
 20 Q. Do you head the department that's in charge of  
 21 processing new permits to appropriate water?  
 22 **A. Yes.**  
 23 Q. As part of those two functions of your program,  
 24 are you required to consider concepts of  
 25 reasonability or impairment under the law, do

Page 1255

1 you know?  
 2 **A. Yes.**  
 3 Q. And so here do we have any pending change  
 4 applications related to the City's proposal?  
 5 **A. No, these are not -- this is not a change**  
 6 **application.**  
 7 Q. Do we have any pending permits to appropriate  
 8 water --  
 9 **A. No.**  
 10 Q. -- related to the City's proposal at issue?  
 11 **A. No.**  
 12 Q. So is it your opinion that we're not operating  
 13 under your normal procedures to consider and  
 14 approve or deny change applications or new  
 15 permit applications?  
 16 **A. That is correct, but even an existing permit or**  
 17 **water right cannot impair.**  
 18 Q. And so impairment is a concern or an issue that  
 19 DWR has or is considering with respect to this  
 20 proposal; is that true?  
 21 **A. Yes.**  
 22 Q. And has DWR come to an opinion of any kind with  
 23 respect to the potential for impairment and the  
 24 City's proposal that we're here to discuss?  
 25 **A. Yes. By looking at figure 10 at the end of the**

Page 1256

1 **modeled drought and even with the 10 percent --**  
 2 **or 10-foot, I'm sorry, contingency, IW16 looks**  
 3 **like it's the lowest one and it still has**  
 4 **131 feet of saturated thickness.**  
 5 Q. And so which -- just so we're clear, which  
 6 figure are you referring to, 10 or 11?  
 7 **A. Well, it's figure 11, and IW16 still has**  
 8 **131 feet of saturated thickness based on the**  
 9 **model.**  
 10 Q. So you're referring to a particular index  
 11 cell --  
 12 **A. Right.**  
 13 Q. -- depicted within figure 11?  
 14 **A. Correct.**  
 15 Q. And so -- okay. You said that there's still,  
 16 according to this figure, how much percent of  
 17 aquifer saturated thickness?  
 18 **A. Based on that -- that cell, it's 72 percent**  
 19 **but 131 feet.**  
 20 Q. Okay. And so given the percentage saturated  
 21 thickness of all these index cells, according to  
 22 the modeling as shown on figure 11, did that --  
 23 did that cause or result in some opinion of DWR  
 24 about the prospect of impairment regarding the  
 25 City's request to lower the currently authorized

Page 1257

1 bottoms of the minimum index cell levels?  
 2 **A. Even lowered, if we get there, there's still**  
 3 **80 percent of the aquifer remaining. I mean,**  
 4 **approximately 80 percent of the aquifer**  
 5 **remaining.**  
 6 Q. So you're saying that you think on average, if  
 7 one were to average all these percentages, are  
 8 you saying you think it's 80 some percent full  
 9 still?  
 10 **A. Just -- just by looking at the numbers. I**  
 11 **haven't done them, but just by roughly looking**  
 12 **at this map, it's roughly 80 percent full.**  
 13 Q. Okay. And if that's correct as you say, then  
 14 did that result in DWR having an opinion on  
 15 whether or not the City's element number one of  
 16 their proposal, i.e., lowering the bottoms,  
 17 what, if anything, does that give DWR to believe  
 18 about the prospect of impairment?  
 19 **A. There's still a lot of aquifer left.**  
 20 Q. Okay. And so --  
 21 **A. So we didn't think it would impair because of**  
 22 **the amount of aquifer that was left.**  
 23 Q. The current bottoms to the minimum index cell  
 24 levels, they're based on water levels from what  
 25 year?

1 **A. 1993.**  
2 Q. And do you recall whether there were -- you were  
3 working for DWR in '93, correct?  
4 **A. Correct, yes.**  
5 Q. Do you recall whether there were impairment  
6 complaints in the area of this well field shown  
7 on figure 11, do you recall whether there were  
8 impairment complaints in 1993 when the water  
9 levels were at the levels that were used to  
10 establish the current minimum index cell level  
11 bottom?  
12 **A. I don't remember any impairment complaints at**  
13 **that time.**  
14 Q. And so I'll ask you to turn to table 2-11, which  
15 is on the preceding page from figure 11 in the  
16 City's proposal.  
17 **PRESIDING OFFICER:** I'm sorry,  
18 Mr. Oleen, I'm going to interrupt you  
19 before we move on. As I -- maybe I heard  
20 this wrong, but I just want to clarify,  
21 when you were first talking with  
22 Mr. Letourneau about figures 10 and 11, I  
23 think I heard you say one thing and him say  
24 another in terms of what figure 11  
25 represents at the end of eight-year

1 Q. Okay. And so you were referring to figure 11  
2 when you were saying that you think that on  
3 average all these index cells total up to  
4 something like 80 some percent; is that right?  
5 **A. Roughly.**  
6 Q. And so it was on that basis that you said what  
7 again about DWR's belief with respect to the  
8 prospect of impairment as a result of lowering  
9 the bottoms?  
10 **A. We don't think impairment will occur based on**  
11 **lowering the bottoms.**  
12 Q. And so then I was -- I would ask you to turn to  
13 table 2-11, which is on the page right before  
14 figure 11, and you can see that middle column in  
15 table 2-11, it says, existing versus proposed.  
16 Do you see that column?  
17 **A. I do.**  
18 Q. Is that column purporting to show a difference  
19 in minimum index cell level elevations from the  
20 current bottoms to the proposed bottoms, is that  
21 your understanding of what that middle column  
22 shows?  
23 **A. Yes.**  
24 Q. And so that middle column is showing a lowering  
25 in terms of feet by each of the index cell

1 drought. Does figure 11 represent at the  
2 end of eight-year drought?  
3 **MR. OLEEN:** Well, I'll try to  
4 clarify that with the witness.  
5 **BY MR. OLEEN:**  
6 Q. So, Mr. Letourneau, if you'll turn to figure 10,  
7 the bottom right-hand corner, does it say end of  
8 simulated drought stress period eight?  
9 **A. Yes.**  
10 Q. So is figure 10, does that show the saturated  
11 thickness at the end of the eight-year simulated  
12 drought that was referred to back on table 2-3?  
13 **A. Yes.**  
14 Q. So figure 11, it's not your understanding that  
15 it shows things at the end of the eight-year  
16 simulated drought, but rather it's showing  
17 saturated thickness all the way down to the  
18 proposed new minimum index cell levels, the  
19 proposed new bottoms; is that correct?  
20 **A. Correct.**  
21 Q. And so is it your understanding that if one  
22 would want to call it a worst-case scenario that  
23 figure 11 is worst-case scenario compared to  
24 figure 10?  
25 **A. Yes, based on this proposal.**

1 levels from the current authorized bottoms to  
2 the proposed, correct?  
3 **A. Correct.**  
4 Q. And so what -- what's the high and low numbers  
5 on that middle column there? Roughly?  
6 **A. Roughly, I see a high of 23.42 feet and a low of**  
7 **9.24 feet.**  
8 Q. Okay. And let's just consider those numbers in  
9 a general sense, does DWR believe that lowering  
10 the current bottoms by this level of feet, if  
11 this proposal is approved or if the request to  
12 lower the bottoms is approved and these -- each  
13 of these minimum index cells are lowered by that  
14 amount, does DWR think that that lowering is  
15 likely to cause impairment?  
16 **A. No, it won't -- we don't think it'll cause**  
17 **impairment.**  
18 Q. Does DWR think that that is a reasonable or an  
19 unreasonable lowering compared to -- well, let  
20 me strike that, let me rephrase. Based on what  
21 Wichita has claimed -- how Wichita's claimed  
22 they will benefit by lowering these bottoms and  
23 be able to access cumulative recharge credits  
24 longer, do you believe that this is an  
25 unreasonable lowering?

Page 1262

1 **A. It is not unreasonable, but it's also -- retains**  
 2 **the credits longer and not have to use them**  
 3 **because they were stranded based on a higher**  
 4 **water table.**  
 5 Q. If someone -- let me start over. If the  
 6 proposal with its requested new bottoms were to  
 7 be approved and someone were to claim  
 8 impairment, assuming that Wichita did pump water  
 9 that contributed to the water level dropping  
 10 down to at or somewhere close to the new  
 11 proposed bottoms, if someone claimed impairment  
 12 in that regard, is there a mechanism whereby  
 13 that impairment could be investigated and  
 14 addressed within DWR?  
 15 **A. Yes, we -- we've got impairment rules and we do**  
 16 **water rights administration. But in this case,**  
 17 **the City has agreed to anybody impacted, they've**  
 18 **got -- it's written in an MOU right now about**  
 19 **somebody being impacted. They wanted to move**  
 20 **that from what I'll say a nonenforceable MOU to**  
 21 **an enforceable permit condition that even before**  
 22 **someone is impaired, if they're only impacted,**  
 23 **that the City would remedy their water problem.**  
 24 **And so not only do we have the high water table,**  
 25 **we've got the permit condition on the impact, so**

Page 1263

1 **we -- we felt that it was appropriate to move**  
 2 **forward with this proposal.**  
 3 Q. On that topic, if you would turn to the black  
 4 binder to your extreme right and look at what  
 5 has previously --  
 6 **A. Oh, thank you.**  
 7 Q. -- been marked DWR Exhibit 1.  
 8 **A. Okay.**  
 9 **MR. OLEEN:** And I have some  
 10 additional copies if Madam Hearing Officer  
 11 or other counsel would like copies.  
 12 **PRESIDING OFFICER:** I would, that  
 13 would be great, thank you. Thank you.  
 14 **BY MR. OLEEN:**  
 15 Q. Okay. Mr. Letourneau, do you find that letter  
 16 dated June 1st, 2018 to have previously been  
 17 admitted in this hearing as DWR Exhibit 1?  
 18 **A. Yes.**  
 19 Q. And you were just talking about the City's  
 20 agreement as part of this proposal to allow for  
 21 certain conditions to be imposed that would  
 22 safeguard other water right owners in the area;  
 23 is that correct?  
 24 **A. Correct.**  
 25 Q. And I'll ask you to turn to -- well, first let

Page 1264

1 me talk a little bit about this letter. This  
 2 letter was also signed by David Barfield,  
 3 correct?  
 4 **A. That's correct.**  
 5 Q. And this letter is sent to whom?  
 6 **A. This letter went to both the Groundwater**  
 7 **Management District No. 2 and to the City of**  
 8 **Wichita.**  
 9 Q. And take some time if you need to peruse this  
 10 letter, but is it true that this letter encloses  
 11 a document that says responses to GMD2  
 12 legal/policy questions and comments? And then  
 13 after that, it has some draft -- it has some  
 14 draft findings and orders regarding the proposal  
 15 before us; is that correct?  
 16 **A. That's correct.**  
 17 Q. Okay. And on one of these findings and orders,  
 18 if you would turn -- go to the first one and  
 19 turn to paragraphs 12 and 13 and review that and  
 20 then let me know when you're done.  
 21 **A. Okay, I'm prepared.**  
 22 Q. Okay. And so is -- what are these paragraphs 12  
 23 and 13 in relation to what you had just  
 24 testified about Wichita's agreement to have  
 25 certain safeguard conditions be imposed if this

Page 1265

1 proposal were approved?  
 2 **A. They're findings that in order to protect**  
 3 **existing well owners located within 660 feet,**  
 4 **the City has agreed that if the water quality in**  
 5 **an existing domestic well meets current drinking**  
 6 **standards and the quality is changed by the ASR,**  
 7 **then the City will install a home water**  
 8 **treatment system to bring the water back to**  
 9 **drinking water standards.**  
 10 Q. Okay. And, generally, what does -- you don't  
 11 have to recite number 13 below, but if number 12  
 12 addresses water quality, what does proposed  
 13 paragraph 13 address?  
 14 **A. Impact of drawdown.**  
 15 Q. And so what is this proposed set of conditions  
 16 in relation to what you said the City was  
 17 willing to do?  
 18 **A. Well, these would become permit conditions that**  
 19 **would then require the City to protect quality**  
 20 **and quantity.**  
 21 Q. So it's your understanding that as part of the  
 22 proposal -- now, granted, this is a document  
 23 that was drafted by the chief engineer, correct?  
 24 **A. Drafted by us for the chief.**  
 25 Q. Okay. But it's a document that's issued by DWR

1 ultimately, right?  
 2 **A. Correct.**  
 3 Q. But it's your understanding that those -- those  
 4 two draft conditions, proposed draft conditions  
 5 that we talked about, at least in some  
 6 conceptual form the City had agreed to those --  
 7 **A. Yeah.**  
 8 Q. -- as part of the proposal?  
 9 **A. Yeah, absolutely.**  
 10 Q. And turning to your written testimony that has  
 11 been marked as DWR Exhibit 3, at the end of that  
 12 document there is a series of DWR opinions and  
 13 recommendations; is that right?  
 14 **A. That's correct.**  
 15 Q. And I won't make you read all five of them right  
 16 now, but is one of those opinions and  
 17 recommendations that if this proposal is  
 18 approved that there be water quantity and  
 19 quality conditions similar to what was written  
 20 in the draft findings and orders that we looked  
 21 at that's enclosed in DWR Exhibit 1?  
 22 **A. Yes.**  
 23 **MR. OLEEN:** Madam Presiding Officer,  
 24 I am about to go down a new line of  
 25 questioning, I see it's after noon, if you

1 whether it's reasonable or not for the City to  
 2 base this proposal on a 1 percent exceedance  
 3 probability drought?  
 4 **A. No, we don't. We're just thankful that a city  
 5 is planning for a drought.**  
 6 Q. So as far as DWR is concerned, is DWR okay with  
 7 the fact that the City is basing their proposal  
 8 on a 1 percent drought?  
 9 **A. Yes.**  
 10 Q. I want to move on now and talk about -- well,  
 11 first we talked about one of the main two  
 12 aspects of the City's proposal, which is  
 13 lowering the bottoms. The second aspect  
 14 involves this concept of AMCs, correct?  
 15 **A. Correct.**  
 16 Q. In front of you, if you would refer to what has  
 17 been previously admitted DWR Exhibit 1, I  
 18 believe it's the June 1st, 2018 letter, perhaps  
 19 in one of the black binders up there.  
 20 **A. I have it.**  
 21 Q. And, again, this is a letter written June 1,  
 22 2018, signed by David Barfield; is that correct?  
 23 **A. That's correct.**  
 24 Q. Would you please read the first sentence of the  
 25 second paragraph.

1 would think this would be a good time to  
 2 take a break, I'm fine to do that now or I  
 3 can continue.  
 4 **PRESIDING OFFICER:** I think that  
 5 makes a lot of sense. It's 12:20, let's  
 6 meet back at 1:30.  
 7 (Thereupon, a lunch recess was  
 8 taken; whereupon the following was  
 9 had.)  
 10 **PRESIDING OFFICER:** Okay. It's just  
 11 before 1:30, and we are back on the record.  
 12 And, Mr. Oleen, back to you.  
 13 **BY MR. OLEEN:**  
 14 Q. Mr. Letourneau, we're back on the record, and  
 15 you understand that you're still under oath,  
 16 correct?  
 17 **A. Absolutely, yes.**  
 18 Q. Is it correct that DWR views part of its role  
 19 here with respect to this proposal to assess the  
 20 reasonability of it in various aspects?  
 21 **A. Yes.**  
 22 Q. What percentage exceedance probability drought  
 23 is this proposal based on?  
 24 **A. This is a 1 -- a 1 percent drought.**  
 25 Q. And does DWR have a position on whether -- on

1 **A. A more detailed response to your specific  
 2 questions is enclosed with this letter. In  
 3 general, regarding aquifer maintenance credits,  
 4 AMCs, it is the position of myself and the  
 5 Division of Water Resources that AMCs, as  
 6 proposed in this project, constitute a potential  
 7 additional method to accumulate and account for  
 8 recharge credits under the existing authorities.  
 9 Based --**  
 10 Q. Okay, thank you.  
 11 **A. Is that good enough?**  
 12 Q. Thank you, yeah, that's good enough for now.  
 13 You know what, why don't you please go ahead and  
 14 finish that paragraph.  
 15 **A. Based on our ASR regulations and the ability to  
 16 modify Wichita's existing project and accounting  
 17 system, it is our opinion that, with the  
 18 inclusion of proper terms and conditions and  
 19 limitations, an accounting method which creates  
 20 the functional equivalence of aquifer recharge  
 21 could be implemented.**  
 22 Q. And thank you. Now, if you would please read  
 23 the last sentence of the third paragraph, it  
 24 starts with therefore.  
 25 **A. Therefore, as proposed, AMCs appear to be the**

Page 1270

1 functional equivalent of existing recharge  
 2 credits and serve the public interest by  
 3 maintaining a full -- a fuller aquifer instead  
 4 of requiring Wichita to create additional  
 5 capacity in the aquifer.  
 6 Q. And, finally, please read the sentence on the  
 7 next paragraph, the first sentence that starts  
 8 with ultimately.  
 9 **A. Ultimately, if approved, the proposed changes**  
 10 **would result in a change to the accounting**  
 11 **system of the existing ASR project and not a new**  
 12 **ASR project.**  
 13 Q. And one more sentence.  
 14 **A. AMCs are simply an additional form of recharge**  
 15 **credit.**  
 16 Q. Feel free to take the time to reread to yourself  
 17 those sentences that I've just now asked you to  
 18 recite, but what I want to know is if -- is it  
 19 your understanding that that was DWR's position  
 20 regarding the concept of AMCs at the time this  
 21 June 1st, 2018 letter was issued?  
 22 **A. Yes, that was our position.**  
 23 Q. And now that you've -- well, strike that. Based  
 24 on what you've heard in these proceedings to  
 25 date, is it still DWR's opinion each of those

Page 1271

1 sentences that you've read regarding AMCs?  
 2 **A. We are still taking in information in this**  
 3 **hearing, but as of what we've heard to this**  
 4 **point, that is still our position.**  
 5 Q. So is it DWR's position that this concept of AMC  
 6 is an accounting concept?  
 7 **A. Correct.**  
 8 Q. Is it DWR's position that an AMC is the  
 9 functional equivalent of a -- of the current  
 10 type of recharge credit that's currently  
 11 authorized?  
 12 **A. That's correct.**  
 13 Q. And that current type involves -- or is created  
 14 by the physical injection of water, correct?  
 15 **A. That is correct.**  
 16 Q. So do you sometimes, have you heard those  
 17 referred to as physical recharge credits to  
 18 distinguish them from this new proposed concept  
 19 of AMC?  
 20 **A. That's correct.**  
 21 Q. Does DWR have an opinion on whether this AMC  
 22 part of Wichita's proposal is a good idea or  
 23 not?  
 24 **A. Well, we feel it is because it is not requiring**  
 25 **the City to create what I'll call the hole to**

Page 1272

1 make it -- to where physical recharge credits  
 2 can be put into the aquifer.  
 3 Q. And why do you think -- why did DWR think that  
 4 it's good not to create that hole?  
 5 **A. Well, we're operating with a fuller aquifer,**  
 6 **we're -- we're operating with fuller aquifer**  
 7 **conditions.**  
 8 Q. And that's good because why?  
 9 **A. Well, it just seems to be good management.**  
 10 Q. Do you think it's a more efficient way of  
 11 managing the aquifer and the ASR project?  
 12 **A. It's a more efficient way to manage the aquifer**  
 13 **for everybody in the aquifer actually.**  
 14 Q. Do you believe it rises to the level of being in  
 15 the public's interest?  
 16 **A. Put it in -- going into a 1 percent drought with**  
 17 **the aquifer full is in the public interest.**  
 18 Q. You've heard some testimony or mention about  
 19 this concept of passive recharge credits,  
 20 correct?  
 21 **A. Correct.**  
 22 Q. And what's your understanding of where that term  
 23 came about? Let me back up, sorry. First, as  
 24 part of the Phase II approval, is that where  
 25 that concept originated from, do you know?

Page 1273

1 **A. Well, the concept originated a long time ago,**  
 2 **you know, I don't know exactly when, but I'm --**  
 3 **I remember terms like of in lieu of credits from**  
 4 **Dave Stous that worked at Burns & McDonnell, I**  
 5 **remember passive recharge credits. Operational**  
 6 **credits were another term that was used. But**  
 7 **what I remember was that was for getting credit**  
 8 **for using Cheney in lieu of the well field.**  
 9 Q. And using Cheney in lieu of the well field, was  
 10 that something that has been proposed by Wichita  
 11 before?  
 12 **A. Yes.**  
 13 Q. And do you remember when that was and under what  
 14 context?  
 15 **A. I don't remember exactly when. I mean, it was**  
 16 **under the context of talking about ASR.**  
 17 Q. Currently, quote, passive recharge credits, are  
 18 they or are they not prohibited under existing  
 19 ASR orders --  
 20 **A. They are --**  
 21 Q. -- of DWR?  
 22 **A. They are prohibited and we agree with that.**  
 23 Q. Does DWR agree that the concept of AMCs as  
 24 proposed by the City amounts to passive recharge  
 25 credits?

1 **A. They do not, in our opinion.**  
2 Q. Would you please turn to the letter that this  
3 morning we marked as DWR Exhibit 4.  
4 **A. I have it.**  
5 Q. Okay. And we talked about the back story of  
6 when this letter was issued and who issued it,  
7 so would you please read the entire paragraph  
8 number 2.  
9 **A. Aquifer maintenance credits, AMCs, are not**  
10 **passive recharge credits. In his order dated**  
11 **August 8th of 2005 related to the ASR project,**  
12 **David Pope specifically concluded it was**  
13 **inappropriate to allow for passive recharge**  
14 **credits. DWR does not believe AMCs as**  
15 **envisioned are passive recharge credits, the**  
16 **distinction being that the City's proposed AMC**  
17 **recharge credits will pass through the ASR**  
18 **diversion and treatment infrastructure and are**  
19 **subject to the rate and quantity limitations of**  
20 **the permits.**  
21 Q. Thank you. At the time that this letter was  
22 issued, was that DWR's opinion regarding whether  
23 proposed AMCs amount to the prohibited passive  
24 recharge credits?  
25 **A. Yes, that's our position.**

1 **aquifer, then it will be physically recharged;**  
2 **if no room in the aquifer, then it's taken to**  
3 **town, but the AMC then is accumulated.**  
4 Q. And so just to be clear, DWR is not advocating  
5 that passive recharge credits no longer be  
6 prohibited, DWR just doesn't think that AMCs  
7 amount to passive recharge credits; is that  
8 accurate?  
9 **A. That's accurate.**  
10 Q. On the issue of AMCs, if you could refer to what  
11 has previously been marked as DWR Exhibit 1, the  
12 June 1st, 2018 letter, do you have that up  
13 there?  
14 **A. I do.**  
15 Q. We mentioned before that one of the enclosures  
16 to this letter is titled Responses to GMD2  
17 Legal/Policy Questions and Comments, do you see  
18 that there?  
19 **A. Yes.**  
20 Q. Now, you're not an attorney, are you,  
21 Mr. Letourneau?  
22 **A. No.**  
23 Q. Do you know what the process was as far as how  
24 this document was created that's titled  
25 Responses to GMD2 Legal/Policy Questions and

1 Q. And now that you and -- now that we've gone  
2 through these hearing proceedings, has DWR's  
3 opinion changed, or is this still DWR's opinion  
4 on this issue?  
5 **A. Well, while we're still taking in information to**  
6 **this point, that is still our position.**  
7 Q. And can you explain to me why DWR believes that  
8 the type of recharge credit that was proposed in  
9 the past and that was ultimately prohibited and  
10 called a passive recharge credit, can you  
11 explain to me how that concept in DWR's opinion  
12 differs from the concept that Wichita is  
13 proposing here as to AMCs?  
14 **A. The source, it -- in my mind, it starts with the**  
15 **source of water. Cheney is a different source,**  
16 **not taken -- not diverted at the Little Ark**  
17 **intake, not treated at the ASR treatment**  
18 **facility. And so when we looked at AMCs as a**  
19 **functional equivalent, it is diverted -- it**  
20 **starts out just like a recharge credit today, it**  
21 **has -- the water has to be available in the**  
22 **Little Ark, diverted at that point, taken to the**  
23 **treatment facility, treated, and then it goes to**  
24 **a point of is there room in the aquifer or not**  
25 **room in the aquifer? Is there room in the**

1 Comments?  
2 **A. Yeah, our team reviewed it and put these**  
3 **responses together.**  
4 Q. But was this something that you drafted, or was  
5 this something that was drafted by DWR counsel  
6 at the time?  
7 **A. DWR counsel, I believe, Robert Large.**  
8 Q. As far as you know, are the arguments in here on  
9 this -- or the responses on this document still  
10 DWR's position with respect to the issues  
11 discussed in here?  
12 **A. Yes.**  
13 Q. Does DWR view the concept of AMCs as resulting  
14 in a new appropriation of water?  
15 **A. They are not a new appropriation.**  
16 Q. And why do you think that? Or how would you  
17 explain why DWR doesn't think that they're a new  
18 appropriation of water?  
19 **A. They're a recharge credit.**  
20 Q. So it's DWR's position that -- well, let me back  
21 up. The current ASR permits, are they perfected  
22 yet?  
23 **A. No.**  
24 Q. And is it those permits that -- is it those  
25 existing permits that are authorized to generate

Page 1278

1 AMCs? Or recharge credits of any kind, rather?  
 2 **A. They can generate recharge credits but not AMCs**  
 3 **until this proposal goes through.**  
 4 Q. And, currently, is there a cap on the number of  
 5 recharge credits of any kind that Wichita can  
 6 accumulate under existing ASR conditions?  
 7 **A. No.**  
 8 Q. And is there a current limit, though, on how  
 9 many recharge credits Wichita can withdraw in  
 10 any given year?  
 11 **A. I believe it's -- well, it's twofold. It's**  
 12 **19 -- they're authorized to divert 19,000**  
 13 **acre-feet, but that's once they have credit for**  
 14 **them.**  
 15 Q. So assuming the City ever got to the point of  
 16 accumulating 19,000 acre-feet of recharge  
 17 credits, under existing permit conditions, they  
 18 could withdraw that if they have them available?  
 19 **A. Yes.**  
 20 **PRESIDING OFFICER:** I'm sorry, I  
 21 need to make sure I understand your answer.  
 22 So you're saying there's a limit of 19,000  
 23 acre-feet per year of recharge credits the  
 24 City could recover?  
 25 **A. If they had them.**

Page 1279

1 **PRESIDING OFFICER:** If they have  
 2 them.  
 3 **A. Correct.**  
 4 **PRESIDING OFFICER:** Okay. But there  
 5 is that --  
 6 **A. Yeah.**  
 7 **PRESIDING OFFICER:** -- that maximum?  
 8 Thank you.  
 9 **BY MR. OLEEN:**  
 10 Q. So to be clear, Mr. Letourneau, there's  
 11 currently -- well, you tell me if this is  
 12 correct. There's no limit currently on the  
 13 number of recharge credits that can be  
 14 accumulated, but there is a limit on the number  
 15 of recharge credits that currently can be  
 16 withdrawn?  
 17 **A. Yes.**  
 18 Q. Mr. Letourneau, if you'd turn to your written  
 19 testimony that's been marked and admitted as DWR  
 20 Exhibit 3.  
 21 **A. Okay, I have it.**  
 22 Q. I believe so. Oh, you do have it?  
 23 **A. I do have it, I'm sorry, I have it.**  
 24 Q. If you turn to page 7. So I understand that  
 25 this hearing -- these hearing proceedings are

Page 1280

1 not yet concluded, but is it DWR's opinion that  
 2 both aspects of Wichita's proposal, both  
 3 lowering the bottoms and allowing for this  
 4 accounting concept of AMCs, are reasonable and  
 5 in the public interest?  
 6 **A. Yes.**  
 7 Q. But you have stated that DWR has certain permit  
 8 conditions that DWR thinks should be imposed in  
 9 the event that the proposal is approved; is that  
 10 correct?  
 11 **A. Yes.**  
 12 Q. And can you briefly explain for me what those  
 13 current recommendations are that you have in the  
 14 numbers list on page 7?  
 15 **A. Well, because it's in the proposal, we thought**  
 16 **we could condition the -- the proposal for a**  
 17 **maximum accumulation of all recharge credits to**  
 18 **120,000 acre-feet.**  
 19 Q. So DWR is -- essentially agrees with the City,  
 20 the City's willing to impose that limitation,  
 21 and DWR thinks that that limitation should be  
 22 imposed on the accumulation of any type of  
 23 recharge credit?  
 24 **A. That would be fine, yep, that's good.**  
 25 Q. Okay. And number 2, what was the second

Page 1281

1 recommendation of DWR?  
 2 **A. Conditions that adequately ensure that native**  
 3 **rights in the area are protected from any**  
 4 **impairment that may result, such as conditions**  
 5 **that require Wichita to use pumping rotation and**  
 6 **timing if conflicts occur, and that adequately**  
 7 **protect the current domestic use in the well**  
 8 **field.**  
 9 Q. That last clause, that adequately protect the  
 10 current domestic use in the well field, does  
 11 that refer to the draft permit conditions, I  
 12 believe it's numbers 12 and 13, that we talked  
 13 about this morning, that address water quality  
 14 and quantity -- or, yes, I believe water quality  
 15 and quantity that would be imposed on Wichita if  
 16 their proposal were to be approved?  
 17 **A. Yes.**  
 18 Q. Okay. And how about numbers 3 and 4 that are in  
 19 the list here?  
 20 **A. Number 3, we had a lot of questions about the**  
 21 **priority of pumping, and if the bottoms get**  
 22 **lowered, then we felt it would be appropriate**  
 23 **for the City to use their native water rights**  
 24 **first because those renew every year, and with**  
 25 **the lowering, then, it wouldn't strand any of**

1 **the recharge credits. And so we would, working**  
 2 **it out with the City, would pump the native**  
 3 **first and then the recharge second.**  
 4 Q. And those native water rights, I think we  
 5 referred to those before, is that the 40,000  
 6 acre-feet of water that the City has --  
 7 **A. Yes.**  
 8 Q. -- in the well field?  
 9 **A. Yes. To clear that up, the native water rights**  
 10 **authorize 40,000 acre-feet.**  
 11 Q. And is that 40,000 acre-feet, is that, quote,  
 12 ASR water?  
 13 **A. No, no, the 40,000 is the City's water rights**  
 14 **for municipal use in the -- in the Equus Beds**  
 15 **well field.**  
 16 Q. Is it your understanding that the City's  
 17 proposal provides that they would, in the event  
 18 of a drought, that they would pump their native  
 19 water rights before withdrawing any accumulated  
 20 recharge credits?  
 21 **A. If -- if -- it's my understanding if this**  
 22 **proposal is approved in lowering the bottom,**  
 23 **then it wouldn't strand, I'll say, the recharge**  
 24 **credits in the aquifer. So it -- it benefits**  
 25 **the City to use their native water rights**

1 **overall umbrella, the 19,000 would be limited to**  
 2 **the overall umbrella, so it's no additional**  
 3 **water to their suite of water rights.**  
 4 **PRESIDING OFFICER:** From all of the  
 5 sources?  
 6 **A. From all of the sources. And with this -- when**  
 7 **I'm going through these conditions, these have**  
 8 **not been vetted with the City at all yet so ...**  
 9 **BY MR. OLEEN:**  
 10 Q. Is that partly because -- is that partly because  
 11 the chief engineer decided to hold these  
 12 administrative proceedings, and that kind of  
 13 interrupted the discussion that was going on at  
 14 that time?  
 15 **A. Yes, absolutely.**  
 16 Q. But is DWR still, you and DWR still listening to  
 17 these proceedings, taking in information, and  
 18 are you willing to submit revised  
 19 recommendations if you determine it's necessary  
 20 after the end of these proceedings?  
 21 **A. Yeah, absolutely.**  
 22 **MR. OLEEN:** No further questions.  
 23 **PRESIDING OFFICER:** Mr. McLeod, do  
 24 you have any cross?  
 25 //

1 **because they renew every year. Plus in the**  
 2 **modeling, I believe the 40,000 is pumped every**  
 3 **year to accommodate -- and that's what showed**  
 4 **those water levels in that figure 11. So I**  
 5 **think we're counting on the 40,000, or some of**  
 6 **the 40,000 to be pumped, if not all of it.**  
 7 Q. And how about number 4 on your list?  
 8 **A. Yeah, conditions that limit the usage of**  
 9 **accumulated recharge credits to Wichita's**  
 10 **overall authorized quantity. Because we'd heard**  
 11 **from folks that Wichita wants to use this to**  
 12 **bring on more customers, but the City was --**  
 13 **told us, no, it was just to get them through a**  
 14 **drought. So the use of the 19,000 acre-feet of**  
 15 **recharge credits would be limited to the City's**  
 16 **overall quantity, so there wouldn't be a net**  
 17 **growth of 19,000 acre-feet, if that makes sense.**  
 18 **There would be -- it would be included in**  
 19 **their suite of -- limited to their current suite**  
 20 **of water rights.**  
 21 **PRESIDING OFFICER:** So if I  
 22 understand that correctly, they're still  
 23 limited to 40,000 acre-feet?  
 24 **A. Well, they're limited to 40,000, plus Cheney,**  
 25 **plus the other well field and Bentley. So their**

1 **CROSS-EXAMINATION**  
 2 **BY MR. MCLEOD:**  
 3 Q. Mr. Letourneau, you had indicated that a purpose  
 4 of the lower bottoms that we proposed, lower  
 5 index levels, was to permit the City to wait  
 6 longer to draw its recharge credits, leaving  
 7 that water in the aquifer farther into a  
 8 drought, for example. Who does it help if the  
 9 City is forced to draw those credits out  
 10 earlier?  
 11 **A. It doesn't help anyone.**  
 12 Q. And how is it in any way bad if the City is  
 13 enabled to leave the recharge credits in the  
 14 aquifer longer?  
 15 **A. I don't -- I don't see a bad at all.**  
 16 Q. Do you think that that's one of the aspects of  
 17 the City's proposed modifications that would be  
 18 in the public interest, lowering the bottoms to  
 19 enable the City to leave those credits in the  
 20 aquifer longer?  
 21 **A. Yes.**  
 22 Q. You had mentioned in your testimony recollection  
 23 of past conversations with Dale Goter and Joe  
 24 Pajor that the City during the 2011 and 2012  
 25 drought was having evaporative problems with

Page 1286

1 Cheney. And I think you also indicated further  
2 that the rate of evaporation in Cheney was  
3 providing the City an incentive to take water  
4 from Cheney, as much as it could, in order to  
5 not lose that water to evaporation. Do you  
6 think that that same problem would surface in  
7 any drought?  
8 **A. Yes, absolutely.**  
9 Q. And to that extent, in any drought conditions,  
10 whether or not the City had some massive credits  
11 in the aquifer, the City would have that same  
12 incentive to draw from Cheney as heavily as it  
13 could to erase evaporation, correct?  
14 **A. Absolutely.**  
15 Q. I know you've been here through much, if not  
16 all, of the hearings, have you been here through  
17 all of the hearings?  
18 **A. Yes.**  
19 Q. And you probably noticed the recurrent theme of  
20 both the District and the Intervenor that they  
21 suggest that the City's demand to 2060 has been  
22 over-projected. If that were true,  
23 Mr. Letourneau, and the City's demand of 2060 is  
24 over-projected, would the result of that not  
25 then be simply that the City would not need the

Page 1287

1 demand that we have currently projected in table  
2 2-3 and might be able to get through the drought  
3 taking lesser credits than we've projected?  
4 **A. Yes, that's correct.**  
5 Q. And how would that in any way be bad?  
6 **A. I -- I don't see it being bad.**  
7 Q. If the City is -- has over-projected its demand  
8 and we end up with -- we end up then with more  
9 water in the aquifer than we had thought,  
10 correct?  
11 **A. Correct.**  
12 Q. Just as a clarification, because you used the  
13 title in one of your answers, you had said that  
14 the chief engineer has a thorough experiential  
15 knowledge of how models work. And by that, did  
16 you mean the current chief engineer, David  
17 Barfield?  
18 **A. Yes.**  
19 Q. Mr. Letourneau, in some of your testimony,  
20 you've used the term functional equivalent in  
21 referring to the AMCs, and I'd like to have you  
22 explain what you mean by saying that the AMCs  
23 would be functional equivalents of the physical  
24 recharge credits.  
25 **A. Everything's the same except for the space in**

Page 1288

1 **the aquifer. The water has to be available from**  
2 **the Little Ark, it has to be diverted at the**  
3 **diversion point in the Little Ark, it has to go**  
4 **to the ASR treatment facility and be treated,**  
5 **and it's after that point is -- the decision is**  
6 **made whether to put it in the aquifer or take it**  
7 **into town. And that decision is just based on**  
8 **whether there's space in the aquifer or not. So**  
9 **it is the -- to us, it's the equivalent from the**  
10 **start until it gets to the point of the decision**  
11 **if there's space in the aquifer or not.**  
12 Q. If the City under current permit conditions made  
13 the hole in the aquifer by pumping the aquifer  
14 down and then injected recharge to bring the  
15 aquifer back up, how does that -- how does that  
16 end result compare to the end result of allowing  
17 the AMCs and not requiring the City to lower the  
18 aquifer?  
19 **A. Well, it -- it -- simple way to look at it, it's**  
20 **not requiring the City to pump a gallon to**  
21 **replace it with a gallon. Did that answer your**  
22 **question?**  
23 Q. So at the end of both scenarios, then, the state  
24 of the aquifer is the same, but in the AMC  
25 instance, you haven't required the City to make

Page 1289

1 the hole in order to refill the hole?  
2 **A. That's correct.**  
3 Q. And, Mr. Letourneau, how can that be bad for  
4 anyone?  
5 **A. It -- it's not bad.**  
6 Q. Both in Mr. Oleen's questioning and in your  
7 answers, I know you're reserving a caveat that  
8 you have not yet heard all of the information  
9 produced and to be produced as yet in this  
10 hearing. I want to ask you about a specific  
11 item, you know that Mr. Pope, the former chief  
12 engineer, has generated and submitted an expert  
13 report in this proceeding, correct?  
14 **A. Correct.**  
15 Q. And I believe it is already among the materials  
16 posted on the DWR website.  
17 **A. That's correct.**  
18 Q. Have you reviewed that report by Mr. Pope?  
19 **A. Yes.**  
20 Q. And so it is part of the information that you  
21 have looked at, that you have already gathered  
22 up to this point in the hearing?  
23 **A. Correct.**  
24 Q. With respect to the annual limit on withdrawal  
25 of credits that you've referred to, the 19,000

1 acre-feet that the City can't exceed in a year,  
2 even if it has the credits, does the proposal,  
3 does it suggest any change to that 19,000  
4 acre-foot annual limit?  
5 **A. No.**  
6 Q. And if the City subsequently wanted to make a  
7 change to that 19,000 acre-foot limit, what  
8 procedure would the City need to follow to do  
9 that?  
10 **A. It would take authority, additional authority --**  
11 **well, it's authority to pump recharge credits**  
12 **over and above the 19,000, so it would require a**  
13 **new application and an approval of a permit to**  
14 **proceed.**  
15 Q. And so at that point, in order to make that  
16 change, the City would have to come back to the  
17 DWR, go through the new application process, and  
18 consider all of the factors, public interest,  
19 non-impairment of other users, that you would  
20 consider in any new application process?  
21 **A. Absolutely.**  
22 **MR. MCLEOD:** I don't have further  
23 questions for the witness.  
24 **PRESIDING OFFICER:** Mr. Stucky.  
25 **A. The sun is right behind you, so forgive me if I**

1 **take them so ...**  
2 Q. Did you have the occasion when you were, I think  
3 it was at Fort Hays; is that correct?  
4 **A. That's correct.**  
5 Q. Did you study any kind of water regulations  
6 while you were at Fort Hays?  
7 **A. No.**  
8 Q. So your knowledge of studying water regulations  
9 and statutes, that would be based on your last  
10 13 1/2 years of experience, correct?  
11 **A. Well, 33 roughly. I mean, I worked in new**  
12 **applications starting out, which we used, you**  
13 **know, the statutes and rules and regs, so my**  
14 **whole career with the Division of Water**  
15 **Resources we'd be working with rules and regs.**  
16 Q. So for 33 years, you've analyzed the rules and  
17 regulations germane to water law and germane to  
18 water rights; is that correct?  
19 **A. I don't know about analyzed, I mean, I -- I**  
20 **would have referred to them as I was processing.**  
21 Q. In other words, you would have applied --  
22 **A. Correct.**  
23 Q. Okay. So for 33 years, you have looked at the  
24 statutes and regulations and tried to apply them  
25 to applications and water rights that would fall

1 **can't see you. Thank you, Tim.**  
2  
3 **CROSS-EXAMINATION**  
4 **BY MR. STUCKY:**  
5 Q. All right. Mr. Letourneau, just a moment ago,  
6 you testified that I think you've been in your  
7 current role for 13 1/2 years. Is that what you  
8 testified to?  
9 **A. Yes. Yes.**  
10 Q. So what year was it, then, that you started your  
11 current role?  
12 **A. I believe 2006.**  
13 Q. And I didn't catch earlier in your testimony,  
14 what education do you have in -- to help you in  
15 your current role?  
16 **A. I've got a bachelor of science in geology.**  
17 Q. And based on your bachelor of science in  
18 geology, did that prepare you to do any kind of  
19 modeling work or things of that nature?  
20 **A. No.**  
21 Q. Based on your bachelor degree in geology, were  
22 there courses in hydrology?  
23 **A. Yes.**  
24 Q. Were there courses in hydrogeology?  
25 **A. No. If they were available, David, I didn't**

1 before you; is that correct?  
2 **A. That's correct.**  
3 Q. And in doing so, I assume that over the course  
4 of your career, you've also been involved in  
5 changes to these regulations and changes to the  
6 statutes governing water rights?  
7 **A. Yes.**  
8 Q. And, in fact, I assume that at least at some  
9 point in your career, you've testified before  
10 the legislature regarding a perceived regulation  
11 change or a proposed statute change?  
12 **A. Yes.**  
13 Q. And, in fact, because of your knowledge of the  
14 statutes and regulations germane to water  
15 rights, you were perceived as a viable witness,  
16 if you will, in the legislature to testify in  
17 that regard; is that true?  
18 **A. Yes.**  
19 Q. You indicated in your testimony a moment ago  
20 that over the course of your career, you've  
21 analyzed changes to water rights, you've looked  
22 at new applications, you've an -- you've  
23 analyzed annual reports, as well as considering  
24 enforcement. Is that a true statement?  
25 **A. Yes.**

Page 1294

1 Q. In what other ways would you have applied the  
 2 statutes and regulations to water rights or  
 3 water applications?  
 4 **A. I don't know of what else I would have done.**  
 5 **That's our -- that's our core mission work, so**  
 6 **I'm not -- I'm not aware of any more.**  
 7 Q. From an enforcement standpoint, if a application  
 8 comes before you or a water right comes before  
 9 you that you perceive as being out of  
 10 compliance, what do you generally do from an  
 11 enforcement standpoint?  
 12 **A. Depending on the violation, we -- we may issue a**  
 13 **warning, or depending on the level of violation,**  
 14 **we will issue an order under the Water**  
 15 **Appropriation Act and issue a civil penalty.**  
 16 Q. And as you do so, how do you determine whether a  
 17 water right holder is in violation of the  
 18 statutes and regulations?  
 19 **A. There's terms, conditions, and limitations on**  
 20 **every permit of water right, and so if someone**  
 21 **is outside of those terms, conditions, and**  
 22 **limitations, then they're considered out of**  
 23 **compliance.**  
 24 Q. So you would analyze the water right and the  
 25 conditions on the face of that water right, and

Page 1295

1 then would you compare it to the existing  
 2 statutes and regulations that govern it?  
 3 **A. Yes.**  
 4 Q. And if you decided that either, A, the water  
 5 right holder is in violation of their own  
 6 internal terms and conditions in their water  
 7 right or, B, on the other hand, on the face is  
 8 in violation of a statute or regulation, you  
 9 would determine that the water right was out of  
 10 compliance; is that true?  
 11 **A. Yes.**  
 12 Q. And if you determined that the water right was  
 13 out of compliance, then you would take an  
 14 enforcement action; is that right?  
 15 **A. Warning -- yeah, in this case, a warning is**  
 16 **enforcement action, so, yes, there would be**  
 17 **enforcement action.**  
 18 Q. Is one potential, and I know that the Division  
 19 of Water Resources generally has a stairstep  
 20 approach, if you will, with regard to  
 21 enforcement. Is that a true statement  
 22 generally?  
 23 **A. Yes, generally.**  
 24 Q. At some point in that stairstep approach, is it  
 25 true that the Division of Water Resources can

Page 1296

1 suspend or stop the use of the water right?  
 2 **A. We -- yes, we have suspension authority.**  
 3 Q. With respect to your enforcement powers, what is  
 4 the most draconian nature of your powers?  
 5 **A. I don't think we have draconian power.**  
 6 Q. Well, let me ask it this way: What's the  
 7 harshest penalty that you can impose on a water  
 8 right owner?  
 9 **A. Suspension of water use.**  
 10 Q. Do you have the ability to cause a water right  
 11 to cease to exist?  
 12 **A. No, we -- we do not have revocation authority,**  
 13 **but we do have suspension authority.**  
 14 Q. Do you know if in your time, have you ever  
 15 recommended or asked a water right holder to  
 16 voluntarily relinquish their water right, or  
 17 have you ever asked for that?  
 18 **A. We -- we have not initiated someone to**  
 19 **relinquish their water right, but water right**  
 20 **holders will sign a form and relinquish their**  
 21 **water right.**  
 22 Q. But what your testimony is is that you've never  
 23 forced anyone to relinquish a water right?  
 24 **A. No, not that I'm aware of.**  
 25 Q. In addition to the training that you've received

Page 1297

1 on the job by looking at water right  
 2 applications and looking at existing water  
 3 rights, what additional training have you done  
 4 to help qualify you to analyze water rights? In  
 5 other words, in the legal profession, if  
 6 Mr. Adrian wants further training he'll go to  
 7 what are called CLEs to get additional training.  
 8 My question is is there outside training that  
 9 you generally do in your job to --  
 10 **A. Well, to maintain a geology license, we've got**  
 11 **something equivalent of a CLE, I can't remember**  
 12 **exactly what they're called. You know, we go**  
 13 **to -- it's mostly, oh, conferences and things,**  
 14 **to get our hours, we call them, but I haven't**  
 15 **done any other -- I've not taken any additional**  
 16 **school or done training.**  
 17 Q. Have you maintained your geology license?  
 18 **A. I have.**  
 19 Q. So you have continued with those ongoing  
 20 trainings --  
 21 **A. Yes.**  
 22 Q. -- to maintain your license?  
 23 **A. Yes.**  
 24 Q. And, Mr. Letourneau, just one thing I'm going to  
 25 respectfully ask, as we start this, if you could

1 wait till my question is finished before you  
2 answer so we can create a clear record, I'd ask  
3 that you do that.  
4 **A. I'm very sorry, I will.**  
5 **MR. OLEEN:** Sorry, Mr. Stucky, would  
6 it help, and it might help for me too if  
7 that mic could be raised?  
8 **A. It -- it won't stay. I'll figure it out. Thank**  
9 **you.**  
10 **MR. OLEEN:** May I approach and  
11 readjust that, Madam Officer?  
12 **A. Well, we tried, Aaron.**  
13 **MR. STUCKY:** It won't?  
14 **A. Right.**  
15 **PRESIDING OFFICER:** Yeah, I don't  
16 think -- just put it farther back under the  
17 boom.  
18 **A. And I apologize for interrupting. Okay, I'll do**  
19 **better.**  
20 **BY MR. STUCKY:**  
21 Q. No, it's no worries. And I certainly was not  
22 trying to scold you by any means. When you're a  
23 friend or an acquaintance with someone,  
24 generally you can finish sentences for the  
25 person, but because this is a hearing, we have

1 **PRESIDING OFFICER:** Yes. Which  
2 volume?  
3 **MR. STUCKY:** Oh, I'm sorry, Volume  
4 1, Exhibit 20.  
5 **BY MR. STUCKY:**  
6 Q. Mr. Letourneau, I'd asked that you flip to  
7 Exhibit 20 in Volume I of the District's  
8 exhibits, and you're on that exhibit now; is  
9 that correct?  
10 **A. That's correct.**  
11 Q. Do you recognize that particular exhibit as  
12 your -- a transcript of your deposition  
13 testimony?  
14 **A. Yes.**  
15 Q. And would you agree that you had an opportunity  
16 to review and sign that deposition transcript?  
17 **A. Yes.**  
18 Q. And so at least as you're sitting here today, do  
19 you agree that that deposition transcript  
20 represents what you would have said during that  
21 deposition?  
22 **A. Yes.**  
23 Q. And as you're sitting here today, are you aware  
24 in any regard how your testimony today would be  
25 different than what's in your deposition

1 to create a clear record.  
2 So other than your outside training to  
3 maintain your geology license, would the bulk of  
4 your training and experience be based on your  
5 33 years while working for the Division of Water  
6 Resources?  
7 **A. Yes.**  
8 Q. You indicated that prior to your current role  
9 you had the occasion to look at water right  
10 applications prior to your current role, tell me  
11 what that role was and why you would have looked  
12 at applications.  
13 **A. When I was first hired with the Division of**  
14 **Water Resources, I was a hydrologist I and hired**  
15 **on to review new applications. And then soon**  
16 **after that, though, in a couple months, I was**  
17 **reviewing new applications and changes.**  
18 Q. So trying to determine permit conditions for  
19 water rights or trying to decide whether a water  
20 right should be approved, for example, that's  
21 within your bailiwick; is that true?  
22 **A. Yes.**  
23 Q. There's a -- should be an exhibit notebook --  
24 **MR. STUCKY:** May I approach the  
25 witness?

1 transcript?  
2 **A. It wouldn't -- it wouldn't be different.**  
3 **MR. STUCKY:** I would ask that the  
4 District's Exhibit 20 be admitted into  
5 evidence.  
6 **PRESIDING OFFICER:** Any objection?  
7 GMD 20 will be admitted.  
8 **BY MR. STUCKY:**  
9 Q. A moment ago, I believe you said that you  
10 weren't actually involved in ASR Phase I and ASR  
11 Phase II. Is that what your testimony was?  
12 **A. I knew about it, but I didn't do any of the**  
13 **processing.**  
14 Q. So, for example, if you were to flip to page 17  
15 of Exhibit 20 and refer to line 9 of -- line 9  
16 on page 17, in fact, in your deposition, you  
17 also indicated that you weren't involved in  
18 Phase I or Phase II of the ASR project; is that  
19 true?  
20 **A. That's true.**  
21 Q. However, you indicated that your current role  
22 began in 2006; is that right?  
23 **A. That's correct.**  
24 Q. Do you know what the date of the ASR Phase II  
25 order is?

Page 1302

1 **A. No, I don't.**  
 2 Q. I would ask --  
 3 **MR. STUCKY:** Approach the witness?  
 4 **PRESIDING OFFICER:** Yes.  
 5 **BY MR. STUCKY:**  
 6 Q. Do you recognize Exhibit 28, Mr. Letourneau?  
 7 **A. Yes, it is the, I believe, the master order for**  
 8 **Phase II.**  
 9 Q. And does that look like to be a true and correct  
 10 copy of that master order for Phase II?  
 11 **A. Yes.**  
 12 **MR. STUCKY:** I'm not sure if we've  
 13 moved to admit this already, but if we  
 14 haven't, I would like to move to admit  
 15 Exhibit 28, District Exhibit 28.  
 16 **PRESIDING OFFICER:** Any objection?  
 17 **MR. OLEEN:** No, Madam Hearing  
 18 Officer, I believe you've already taken  
 19 judicial notice of all Phase I and II  
 20 orders anyways.  
 21 **PRESIDING OFFICER:** That is true.  
 22 **BY MR. STUCKY:**  
 23 Q. Now, with respect to this particular exhibit, if  
 24 I were to tell you that this ASR Phase II order  
 25 is dated September 18, 2009, would you disagree

Page 1303

1 with that date?  
 2 **A. No, that's the correct date.**  
 3 Q. So I guess my question is this: If you were in  
 4 your current role back in 2006 and ASR Phase II,  
 5 the date of that official order is 2009,  
 6 wouldn't you at least have had some involvement  
 7 in the ASR Phase II process?  
 8 **A. You know, I knew about it, but it was really Ken**  
 9 **Cope and Paul Graves at that time, I believe.**  
 10 **Yeah, I was there, but the other folks were**  
 11 **working on it. So I knew about it, of course.**  
 12 Q. So although you weren't one of the main horses,  
 13 if you will, working on ASR Phase II, you at  
 14 least had some knowledge of it and some, at  
 15 least, remote involvement in the process?  
 16 **A. Yes. Yes, I knew about it.**  
 17 Q. And as you have studied today's proposal that's  
 18 before the hearing officer today, you have also  
 19 had the occasion to look at the Phase I and  
 20 Phase II orders to prepare for this hearing?  
 21 **A. Yes.**  
 22 Q. And, in fact, would you also be familiar with  
 23 the memorandum of understandings that were  
 24 entered -- entered into for Phase I and Phase  
 25 II?

Page 1304

1 **A. Yes.**  
 2 Q. Is it your understanding that with respect to  
 3 the memorandum of understanding with Phase I  
 4 that safe yield was a requirement?  
 5 **A. I'd have to review it again. I don't -- I don't**  
 6 **recall it right now, but I'd have to review it.**  
 7 Q. And off the top of your head, with respect to  
 8 Phase II, do you recall if safe yield was a  
 9 requirement?  
 10 **A. I didn't get that far -- that far into it.**  
 11 Q. Do you know just collectively with respect to  
 12 Phase I and Phase II if at some point a safe  
 13 yield requirement was put into place?  
 14 **A. I can't say without looking at documents.**  
 15 Q. I would ask that -- let's see. I would ask that  
 16 you flip to Exhibit 57 in Volume IV of the  
 17 District's notebooks. Do you know what -- do  
 18 you recognize Exhibit 57? If I were to tell you  
 19 that it's a letter that the City of Wichita sent  
 20 on June 24th, 2010 to a well owner asking for a  
 21 spacing waiver with respect to ASR Phase II,  
 22 would that look like an accurate depiction of  
 23 what this letter is?  
 24 **A. Yes.**  
 25 **MR. MCLEOD:** I'm going to object to

Page 1305

1 that, I don't think that counsel has  
 2 foundation for establishing what that is.  
 3 **PRESIDING OFFICER:** Would you like  
 4 to rephrase?  
 5 **BY MR. STUCKY:**  
 6 Q. What is Exhibit 57?  
 7 **A. The first page of that, it's -- 57 is a number**  
 8 **of documents. That is a letter -- first one is**  
 9 **a letter to U.S. National Bank Association.**  
 10 Q. There's several letters?  
 11 **A. Correct.**  
 12 Q. And they're to individual well owners, would you  
 13 agree with that?  
 14 **A. Yes.**  
 15 Q. However, the basic content of each of the  
 16 letters is the same. Is that a true statement?  
 17 **A. Yes.**  
 18 Q. A moment ago, I characterized what these letters  
 19 were requesting. Can you state for the record  
 20 what it is these letters are requesting?  
 21 **A. It -- the last paragraph of the letter, the City**  
 22 **is respectfully requesting that the -- who the**  
 23 **letter went to sign a consent form.**  
 24 Q. Okay. And a consent form for what?  
 25 **A. For, it looks like, well spacing to a domestic**

1 well.  
2 Q. And so these are letters seeking to get consent  
3 from well owners to violate spacing requirements  
4 essentially. Is that a true statement?  
5 **A. I don't know about violate spacing requirements**  
6 **but to install a well less than spacing, you**  
7 **know, less than the spacing requirements that we**  
8 **have.**  
9 Q. Let me ask you this: Are these letters asking  
10 for exceptions to spacing requirements?  
11 **A. Yes.**  
12 Q. I'd ask that you look at the third sentence of  
13 this particular level -- I'm sorry, of this  
14 particular letter, could you read the third  
15 sentence of this letter, the very first letter  
16 in Exhibit 57?  
17 **A. Up to, is it the up to 65 --**  
18 Q. Yeah.  
19 **A. Okay. Up to 65 billion gallons of water can be**  
20 **stored in the portion of the aquifer that has**  
21 **been dewatered from predevelopment, 1940, until**  
22 **the water levels observed in 1993.**  
23 Q. So in that sentence of these letters, it  
24 mentions the 1993 level; is that correct?  
25 **A. It does.**

1 Q. And in clarifying for these well holders as far  
2 as assurances that they would have with regard  
3 to signing these spacing exceptions, one of  
4 those assurances was that water levels would not  
5 drop below the 1993 levels; is that correct?  
6 **A. That's correct.**  
7 Q. I'd ask that you now turn in your exhibit  
8 notebook to Exhibit 53.  
9 **A. In the same notebook?**  
10 Q. In the same notebook. Have you arrived at that  
11 spot in the notebook?  
12 **A. Yes, I'm there.**  
13 Q. Do you recognize Exhibit 53?  
14 **A. Yes.**  
15 Q. What is Exhibit 53?  
16 **A. It's a letter from David Warren, who was then**  
17 **the director of utilities, to the board of**  
18 **directors of GMD2.**  
19 Q. And what does this letter seek to accomplish?  
20 **A. It -- it's explaining well spacing for the ASR**  
21 **wells in one, two, three, four, five, six,**  
22 **seven, eight, nine, in nine applications, I**  
23 **believe.**  
24 Q. And so is it asking something of the GMD staff?  
25 I would ask that you read the second sentence of

1 **MR. STUCKY:** And I think that we've  
2 already moved to admit Exhibit 57 into  
3 evidence, but at this point I'll pause, and  
4 to the extent it wasn't already admitted, I  
5 would ask that it be admitted into  
6 evidence?  
7 **PRESIDING OFFICER:** Any objection?  
8 **MR. MCLEOD:** I would just ask a  
9 foundational question, are these letters  
10 that the City produced in response to  
11 discovery requests?  
12 **MR. STUCKY:** I believe they were.  
13 **MR. MCLEOD:** No objection.  
14 **PRESIDING OFFICER:** GMD 57 will be  
15 admitted.  
16 **BY MR. STUCKY:**  
17 Q. With regard to that first paragraph, could you  
18 read the last sentence of that paragraph?  
19 **A. Withdrawals will not be permitted if water**  
20 **levels are below the 1993 baseline established**  
21 **by the ASR permit.**  
22 Q. So in other words, these holders of water  
23 rights, if you will, were asked for spacing  
24 exceptions; is that correct?  
25 **A. That's correct.**

1 the letter. Aloud for the record.  
2 **A. Okay. The purpose of this letter is to seek a**  
3 **review of GMD staff recommendations and request**  
4 **a waiver and/or exemption of the GMD2 of the**  
5 **well spacing requirements in K.A.R. 5-22-2(a).**  
6 Q. So in other words, not only were some of the  
7 individual well -- or individual water right  
8 holders asked for spacing waivers, the City of  
9 Wichita also asked the GMD2 to grant some  
10 spacing waivers and exceptions to those  
11 regulations. Is that a true statement?  
12 **A. That's true.**  
13 **MR. STUCKY:** I would ask that the  
14 District's Exhibit 53 be admitted.  
15 **PRESIDING OFFICER:** Any objections?  
16 GMD 53 will be admitted.  
17 **BY MR. STUCKY:**  
18 Q. With regard to this letter in -- that's shown in  
19 Exhibit 53, there is some assurances that are  
20 made by the City of Wichita, specifically by  
21 Mr. Warren. Would that be an accurate  
22 statement?  
23 **A. Yes.**  
24 Q. And in particular, if we turn to the last page  
25 of this particular letter, could you read the

Page 1310

1 very first sentence of the last paragraph of  
 2 that letter?  
 3 **A. Whereas there is an extensive public enhancement**  
 4 **to the -- to the public good associated with**  
 5 **restoring and preserving water levels in the**  
 6 **Equus Beds associated with the ASR project, and**  
 7 **whereas ASR water rights may be utilized only**  
 8 **when water levels exceed the level observed in**  
 9 **1993, and whereas without the exemption on well**  
 10 **spacing, the extensive number of existing**  
 11 **domestic and non-domestic wells will make it**  
 12 **impossible for the City to install an adequate**  
 13 **number of recharge wells in the project area,**  
 14 **the City requests that ASR wells be determined**  
 15 **to be exempt from well spacing requirements.**  
 16 Q. So once again, in this letter from the City to  
 17 GMD2, which would be the same as the District in  
 18 this case, the City, let's break this down,  
 19 first of all, asks for well spacing waivers,  
 20 correct?  
 21 **A. Correct.**  
 22 Q. And in asking for those well spacing waivers,  
 23 they made a few assurances under which those  
 24 well spacing waivers should be granted; is that  
 25 right?

Page 1311

1 **A. That's right.**  
 2 Q. Was one of the assurances that was made by the  
 3 City of Wichita with respect to asking for the  
 4 well spacing waivers, was one of those  
 5 assurances that there would be no drop below the  
 6 1993 levels?  
 7 **A. In this letter, yes.**  
 8 Q. So in other words, what we see from Exhibit 57  
 9 and Exhibit 53 is that when well spacing waivers  
 10 were granted back at that time, they were  
 11 granted conditioned upon the understanding that  
 12 we wouldn't drop below the 1993 levels; is that  
 13 correct?  
 14 **A. That's correct.**  
 15 Q. So is it your view that if that is true, if  
 16 we're now dropping, seeking to drop below the  
 17 1993 levels, would it be your opinion that the  
 18 City should have to go to water right owners or  
 19 holders and seek new spacing waivers?  
 20 **A. Well, that's what this hearing process was about**  
 21 **was to try to get all of the locals notified and**  
 22 **things of that. I've not thought yet right now**  
 23 **about seeking new spacing waivers.**  
 24 Q. But certainly at least as we look at the fact  
 25 that there -- the spacing waivers were granted

Page 1312

1 with that condition in mind, it at least creates  
 2 a question in your mind whether or not we should  
 3 seek new spacing waivers. Is that an accurate  
 4 characterization of what you're thinking?  
 5 **A. Well, it -- yes, it does -- it does raise a**  
 6 **question, but the proposal that we have in front**  
 7 **of us, whether it's the '93 level or the new**  
 8 **level, we're not seeing a significant difference**  
 9 **in the aquifer to where impairment would occur.**  
 10 **But this is the first -- first time that -- that**  
 11 **I've thought about it.**  
 12 Q. In his testimony, Mr. McCormick stated that it  
 13 was his opinion that minimum index levels were  
 14 not intended to be a requirement of Phase II.  
 15 Do you recall any of that testimony?  
 16 **A. Oh, I recall the testimony, yes.**  
 17 Q. So although Mr. McCormick said that for the  
 18 record, from what you've just reviewed and  
 19 having also looked at the ASR Phase II order, do  
 20 you believe a correction should be made to the  
 21 record with respect to whether or not spacing  
 22 waivers were a condition -- or not lowering the  
 23 minimum index level below the 1993 level was a  
 24 condition of ASR Phase II?  
 25 **A. Can you say that again, I'm sorry?**

Page 1313

1 Q. Let me back up.  
 2 **A. Yeah.**  
 3 Q. Mr. McCormick testified that he didn't believe  
 4 that it was a condition of ASR Phase II to  
 5 assure that we wouldn't drop below the 1993  
 6 levels. Having reviewed Exhibit 53 and  
 7 Exhibit 57, do you believe that, in fact, it is  
 8 a requirement that with respect to ASR Phase II  
 9 we not drop below the 1993 levels?  
 10 **A. Well, the 1993 levels were carried over into**  
 11 **Phase II, if that -- I mean, based on this,**  
 12 **that's what happened.**  
 13 Q. So in other words, not dropping below the 1993  
 14 levels was a requirement of ASR Phase II?  
 15 **A. Yes.**  
 16 Q. And so to the extent that Mr. McCormick's  
 17 testimony stated otherwise, you would disagree  
 18 with that testimony; is that correct?  
 19 **A. Well, yeah, I mean, in a way that Phase II -- I**  
 20 **mean, the '93 levels were carried over --**  
 21 **carried forward into Phase II.**  
 22 Q. And, in fact, in ASR Phase II, and I can let you  
 23 look at the order again, for ASR Phase II, the  
 24 City agreed to not drop below the 1993 minimum  
 25 index level; is that correct?

1 **A. That's correct.**  
2 Q. Also based on your understanding of ASR Phase  
3 II, was physical water injected into the aquifer  
4 to receive a recharge credit?  
5 **A. Yes.**  
6 Q. First of all, can you explain for the record  
7 what's meant by physical water?  
8 **A. Wet water, I mean, an actual molecule of --**  
9 **actual water was put into the aquifer.**  
10 Q. And where would that water come from?  
11 **A. It would come initially from the Little Ark and**  
12 **then through the treatment facility and then**  
13 **injected or put into the recharge basin.**  
14 Q. Would it then be stored in the basin storage  
15 area?  
16 **A. Yes.**  
17 Q. Then at a later time, could that water be  
18 withdrawn and appropriated for municipal use?  
19 **A. A portion of it.**  
20 Q. And explain what you mean by a portion of it.  
21 **A. Well, when it goes into the basin storage area,**  
22 **it leaks a little bit, and so some of the**  
23 **recharge credit actually goes away.**  
24 Q. So to the extent the portion that remained,  
25 would that be then sent to the City and used for

1 **A. That's correct.**  
2 Q. At what point in that entire process was the  
3 water first appropriated to a beneficial use?  
4 **A. When it was taken from the Little Ark River**  
5 **for -- and treated at the treatment facility and**  
6 **then it's -- because in our system, we have that**  
7 **portion of it as artificial recharge, that's the**  
8 **beneficial use. So I believe -- I believe it**  
9 **would be metered from the river.**  
10 Q. So there's actually two beneficial uses that  
11 come into play with artificial recharge. Is  
12 that a true statement?  
13 **A. In this particular project, there's two, there's**  
14 **artificial recharge and municipal use.**  
15 Q. And, in fact, both of those are identified in  
16 the City's existing permits; is that right?  
17 **A. Yes.**  
18 Q. And so let's walk through the two beneficial  
19 uses. And, of course, Mr. Letourneau, for  
20 33 years, you've studied statutes and  
21 regulations, and I'm sure you're quite familiar  
22 with the Kansas Water Appropriation Act; is that  
23 correct?  
24 **A. I hope so.**  
25 Q. Is that a yes?

1 municipal use?  
2 **A. Yes, it could.**  
3 Q. So I want to make sure I understand ASR Phase  
4 II. So the steps are, number one, the Little  
5 Arkansas River would flood, and water could be  
6 taken from the Little Arkansas River; is that  
7 correct?  
8 **A. That's correct.**  
9 Q. Step number two is that this water could then be  
10 treated in the ASR treatment facility; is that  
11 right?  
12 **A. That's correct.**  
13 Q. Step number three is that after it's treated,  
14 that water could be injected into the aquifer;  
15 is that right?  
16 **A. That's correct.**  
17 Q. Step number four is that that water is then  
18 stored in the basin storage area of the aquifer?  
19 **A. Correct.**  
20 Q. Step number five is to determine what extent of  
21 that water was lost; is that -- is that correct?  
22 **A. That's correct.**  
23 Q. And to the extent the water wasn't lost, the  
24 next step was that this water could be sent to  
25 the City for municipal use; is that right?

1 **A. Yes.**  
2 Q. And I think that you understand that one of the  
3 touch -- touchstones of the Kansas Water  
4 Appropriation Act and the whole concept of prior  
5 appropriation is the ability to appropriate  
6 water for a beneficial use. You understand  
7 that?  
8 **A. Yes, that's the start of the project.**  
9 Q. And so in this case, understanding what those  
10 two beneficial uses are would be quite  
11 important; is that correct?  
12 **A. Yes.**  
13 Q. And so the first beneficial use occurs when this  
14 water is taken out of the Little Arkansas River  
15 and then injected into the actual aquifer, is  
16 that the first beneficial use?  
17 **A. Yes.**  
18 Q. And, in fact, when this water is taken out of  
19 the Little Arkansas River and injected into the  
20 aquifer, the beneficial use is artificial  
21 recharge; is that right?  
22 **A. That's correct.**  
23 Q. But then there's a second beneficial use that's  
24 been identified in the City's existing permits;  
25 is that right?

Page 1318

1 **A. Yes.**  
 2 Q. At what point would the second beneficial use be  
 3 obtained by the City, would the City have first  
 4 obtained the second beneficial use or  
 5 appropriated it to the second beneficial use?  
 6 **A. When the City diverts a recharge credit for**  
 7 **municipal use.**  
 8 Q. So, one, artificial charge when it's injected  
 9 physically into the aquifer, number two is when  
 10 this credit, this physical recharge credit is  
 11 taken back out of the aquifer and taken to the  
 12 City where it can be used in the municipal water  
 13 supply; is that correct?  
 14 **A. That's correct.**  
 15 Q. And that would be the municipal beneficial use  
 16 in this case?  
 17 **A. That's correct.**  
 18 Q. Can you tell me what K.A.R. 5-22-7(b) is?  
 19 **A. If I could look at it. I can tell by the first**  
 20 **number it's a Groundwater Management District**  
 21 **No. 2 regulation.**  
 22 Q. I'm going to ask that you --  
 23 **MR. STUCKY:** May I approach the  
 24 witness?  
 25 **PRESIDING OFFICER:** Yes.

Page 1319

1 **A. Do you have it up here?**  
 2 **BY MR. STUCKY:**  
 3 Q. Exhibit 22. I actually will ask that you turn  
 4 to Exhibit 24 of the District's notebook. I  
 5 apologize, I said Exhibit 22, I'm asking that  
 6 you turn to Exhibit 24.  
 7 **A. I'm there.**  
 8 Q. Do you recognize this to be the rules and  
 9 regulations that have been promulgated with  
 10 respect to water rights in Kansas?  
 11 **A. This is the rules and regulations of Equus Beds**  
 12 **Groundwater Management District No. 2, so yes.**  
 13 Q. Can you turn to K.A.R. 5-22-7(b)?  
 14 **A. I'm there.**  
 15 Q. If you could go to subsection (b) of K.A.R.  
 16 5-22-7.  
 17 **A. Okay.**  
 18 Q. There's certain exceptions to safe yield; is  
 19 that right? And, I'm sorry, just for a clear  
 20 record, let me back up. You're familiar with  
 21 this statute -- or, I'm sorry, this regulation  
 22 now?  
 23 **A. Yes, I am.**  
 24 Q. Tell me generally what this regulation is.  
 25 **A. This regulation refers to the safe yield and how**

Page 1320

1 **it is applied within the boundaries of**  
 2 **Groundwater Management District No. 2.**  
 3 Q. Now turn to subsection (b) of that regulation.  
 4 **A. Okay.**  
 5 Q. In subsection (b), it says, the following shall  
 6 not be subject to this regulation, and then  
 7 there's a list of aspects that are not subject  
 8 to that regulation, correct?  
 9 **A. Yeah, just a second here, I got to get -- I got**  
 10 **to get with you.**  
 11 Q. If you turn to the second page of that  
 12 regulation, about halfway down, maybe two-thirds  
 13 of the way down, there is a subsection (b).  
 14 **A. Oh, okay, I'm there, thank you.**  
 15 Q. And right there, it says, the following shall  
 16 not be subject to this regulation?  
 17 **A. I'm there.**  
 18 Q. Those would essentially be aspects that would be  
 19 exempted from the safe yield regulation; is that  
 20 correct?  
 21 **A. That's correct.**  
 22 Q. Is one of those identified in subsection 7, is  
 23 one of those an application for an aquifer  
 24 storage and recovery well? At the very end of  
 25 that regulation?

Page 1321

1 **A. That's correct.**  
 2 Q. So in other words, ASR Phase II was exempt from  
 3 the safe yield regulations; is that right?  
 4 **A. That's -- that's right.**  
 5 Q. When this regulation was enacted, did it only  
 6 contemplate actual physical injection of water  
 7 into the aquifer?  
 8 **MR. OLEEN:** Objection, I don't think  
 9 the witness can testify to what this  
 10 regulation contemplated or not.  
 11 **BY MR. STUCKY:**  
 12 Q. Mr. Letourneau, I'd ask that you turn to  
 13 Exhibit 20. If you could turn to page 69.  
 14 **A. Okay, I'm getting there. I'm there.**  
 15 Q. Actually, if you could turn -- look at page 70  
 16 of your deposition transcript.  
 17 **A. Okay, I'm there.**  
 18 Q. At the bottom -- and you would agree that Lee  
 19 Rolfs was the one who was asking you these  
 20 questions at the time of your deposition?  
 21 **A. Yes.**  
 22 Q. At the bottom of page 6 -- or page 70 of your  
 23 deposition, there's a discussion of regulation  
 24 5-22-7(b); is that right?  
 25 **A. Yes.**

1 Q. And, in fact, could you read the question and  
2 answer with respect to -- on -- starting on  
3 line 20 on page 70 and ends on line 24?  
4 **A. The question on line 20, and when the regulation**  
5 **was put into place, wasn't that based on the**  
6 **scenario where actual real water was being put**  
7 **into the aquifer for recharge, not AMC credits?**  
8 Q. And what was your answer?  
9 **A. My answer said, yes, that -- that's correct.**  
10 Q. So, in fact, in your deposition, you rendered an  
11 opinion with regard to whether or not, when this  
12 regulation was enacted, whether or not it  
13 contemplated the actual physical injection of  
14 water into the aquifer, did you not?  
15 **A. Yes.**  
16 Q. And what was your opinion at that time?  
17 **A. Well, the -- at the time when the regulation**  
18 **went into place, the only -- the only thing the**  
19 **City of Wichita could do was a physical recharge**  
20 **credit.**  
21 Q. And so this regulation when it was enacted was  
22 based on the concept that actual physical water  
23 would be injected into the aquifer, correct?  
24 **A. Correct.**  
25 **MR. STUCKY:** Madam Hearing Officer,

1 injecting water into the aquifer to be stored  
2 there; is that correct?  
3 **A. For a physical recharge credit, though, water**  
4 **had to be taken from the aquifer in the**  
5 **beginning to create a hole, and so aquifer was**  
6 **taken -- I mean, water was taken from the**  
7 **aquifer, but then it is from an outside source**  
8 **that it's replacing that water.**  
9 Q. Let me pause you there just for a minute. An  
10 aquifer level can go down from just natural  
11 occurring conditions, correct? In other words,  
12 a drought occurs, a water level in an aquifer  
13 can go down, correct?  
14 **A. Absolutely.**  
15 Q. I just want to make sure we have a clear record  
16 here because I thought you said that for an  
17 aquifer to have any kind of recharge capacity,  
18 somebody has to take water out of the aquifer,  
19 but, in fact, there could be natural reoccurring  
20 conditions that cause an aquifer to drop,  
21 correct?  
22 **A. Well, I think it would require pumping of some**  
23 **sort to make the aquifer go down.**  
24 Q. So your testimony is that if we have an aquifer  
25 and let's just say hypothetically that we have

1 I'm not sure we've ever resolved the  
2 objection, but I think that hopefully  
3 should satisfy Mr. Oleen.  
4 **MR. OLEEN:** I'll withdraw my  
5 objection, he testified as he testified at  
6 his deposition.  
7 **PRESIDING OFFICER:** Thank you.  
8 **BY MR. STUCKY:**  
9 Q. Why generally are recharge and recovery wells  
10 exempt from safe yield regulation K.A.R. 5-22-7?  
11 **A. It's not new water.**  
12 Q. And what do you mean by that?  
13 **A. It is not new water from the aquifer, it is not**  
14 **the natural recharge from the aquifer. It's**  
15 **not -- it's not nat -- you get natural recharge,**  
16 **that is part of the aquifer. This is artificial**  
17 **recharge, so it's water from the Little Ark**  
18 **River that's being induced to the aquifer.**  
19 Q. Let me see if I understand. Is the reason that  
20 it's exempt because water from an outside source  
21 is being added to the water supply in the  
22 aquifer?  
23 **A. Yes.**  
24 Q. And in other words, we're not taking water that  
25 already exists in the aquifer, we're first

1 ten years of no rain, your testimony is that the  
2 aquifer level wouldn't drop at all just based on  
3 an extreme drought condition alone?  
4 **A. Without -- and there's no pumping, is that --**  
5 Q. And there's no pumping, would the aquifer level  
6 drop?  
7 **A. It could, it could leak out, definitely.**  
8 Q. That's my question. So to modify your answer,  
9 would you agree that there could be a recharge  
10 capacity created in an aquifer, either both from  
11 pumping and from natural conditions that cause  
12 water to leak out of the aquifer?  
13 **A. Yes.**  
14 Q. So going back to K.A.R. 5-22-7, the reason why  
15 it's exempt is because water is taken from an  
16 outside source and then physically injected into  
17 the aquifer for a later appropriation; is that  
18 correct?  
19 **A. That's correct.**  
20 **MR. OLEEN:** Objection, I don't --  
21 the reason why what is exempt, could you  
22 perhaps restate your question?  
23 **BY MR. STUCKY:**  
24 Q. The reason that artificial storage and recovery  
25 is one of the exempt -- exemptions from the safe

Page 1326

1 yield statute is because water from an outside  
 2 source is being added and physically injected  
 3 into the aquifer so it can be later  
 4 appropriated; is that correct?  
 5 **MR. OLEEN:** Objection. At this  
 6 time, I don't think Mr. Letourneau can  
 7 opine why a regulation is where it -- the  
 8 way it is. I -- unless he's testified that  
 9 he was part of the enactment of this  
 10 regulation or proposed it, or whatever, as  
 11 far as how it was created.  
 12 **MR. STUCKY:** Madam Hearing Officer,  
 13 he had an understanding of why this  
 14 regulation was enacted and what the purpose  
 15 was at the time it was enacted, he's  
 16 already testified to that, I think I've  
 17 asked a fair question. If he doesn't know  
 18 the answer to my question, then he can say  
 19 he doesn't know.  
 20 **MR. OLEEN:** He didn't -- he didn't  
 21 say he knew why a regulation was enacted,  
 22 as I recall. He said at the time it was  
 23 put in place there was not a specific  
 24 scenario that was contemplated. But as --  
 25 if you're asking him why a regulation was

Page 1327

1 enacted, then don't we need to look at  
 2 the -- anytime regulations are proposed,  
 3 people issue regulatory pronouncements  
 4 about the policy reasons for them. I don't  
 5 think he can testify to the policy reasons  
 6 behind this, he didn't actually cause the  
 7 regulation to be enacted.  
 8 **PRESIDING OFFICER:** I think  
 9 Mr. Letourneau's experience and expertise  
 10 allows him to opine on what he may view as  
 11 a relationship between there being an  
 12 exemption with an ASR well. He doesn't  
 13 have to testify as to the intention behind  
 14 it, but he could testify in his experience  
 15 if he sees a relationship.  
 16 **MR. STUCKY:** That's fair.  
 17 **BY MR. STUCKY:**  
 18 Q. Mr. Letourneau, based on your 33 years of  
 19 experience at the Division of Water Resources,  
 20 is it your professional opinion and belief that  
 21 the reason that number 7 is exempt from K.A.R.  
 22 5-22-7 with respect to the aquifer storage and  
 23 recovery well, do you believe that the reason it  
 24 is exempt is because water is taken from an  
 25 outside source and then physically injected into

Page 1328

1 the aquifer and that particular water can then  
 2 later be appropriated for a beneficial use?  
 3 **A. I think it is because -- my -- yes, I mean,**  
 4 **that's part of it, but it's my opinion that it's**  
 5 **not any new water, it's not naturally occurring**  
 6 **in the aquifer to be appropriated for any other**  
 7 **use. That's why I believe that regulation was**  
 8 **put into place. The only thing at the time,**  
 9 **though, was physical recharge credits when that**  
 10 **regulation was put into place.**  
 11 Q. So by it not being new water, you believe it's  
 12 exempt in the sense that new water is being put  
 13 into the aquifer from an outside source and  
 14 already existing water isn't being taken from  
 15 the aquifer, is that why you believe it's  
 16 exempt?  
 17 **A. Yes.**  
 18 Q. Does the Division of Water Resources ever  
 19 re-appropriate water that is not pumped from a  
 20 certified water right?  
 21 **A. No. We -- we may do it under the authority of**  
 22 **an offset where -- or we may do it under the**  
 23 **authority of a change application, but it's no**  
 24 **more additional water.**  
 25 Q. When I say the City's proposal, do you

Page 1329

1 understand what the City's proposal means?  
 2 **A. Yes, absolutely.**  
 3 Q. Okay. For the record, how long have you been  
 4 involved in discussions or the development of  
 5 the City's proposal?  
 6 **A. A number of years now. I can't tell you the**  
 7 **start date, but we've discussed it for a number**  
 8 **of years.**  
 9 Q. A number of years ago, in the infancy of the  
 10 development of the proposal, did you have a  
 11 conversation with a Joe Pajor regarding the  
 12 proposal?  
 13 **A. A number of them.**  
 14 Q. And was one of the reasons why you first  
 15 discussed lowering the minimum index levels due  
 16 to a discussion about multi-year flex accounts?  
 17 **A. Yes.**  
 18 Q. Tell me the nature of that discussion with  
 19 Mr. Pajor.  
 20 **A. Oh, I don't -- I don't -- I mean, it would have**  
 21 **been just the City's concern about stranding**  
 22 **recharge credits. That's what I would -- that**  
 23 **would have been the nature of our discussions.**  
 24 Q. But also the fact that multi-year flex accounts  
 25 were being used at that time, did that also

1 influence the reason why you started to have  
2 those discussions?  
3 **A. It was. It was the first drought term permit**  
4 **and then taking those drought term permits into**  
5 **multi-year flex accounts.**  
6 Q. You heard discussion about multi-year flex  
7 accounts, were you involved in coming up with  
8 the concept of a multi-year flex account?  
9 **A. Well, the -- not the original one but the**  
10 **changes to the multi-year flex account 2012,**  
11 **absolutely.**  
12 Q. So you have an understanding of multi-year flex  
13 accounts?  
14 **A. Yes.**  
15 Q. Multi-year flex accounts are a way to plan over  
16 the course of five years; is that -- is that  
17 correct?  
18 **A. That's correct.**  
19 Q. Currently, with respect to multi-year flex  
20 accounts, is there a difference in the number of  
21 years of planning with respect to, say, an  
22 irrigation user versus a municipal user?  
23 **A. You know, I think it's different for -- any type**  
24 **of use, the planning would be different.**  
25 Q. Well, my question is the five-year period, is

1 **A. No.**  
2 Q. So right now, if the City of Wichita were to  
3 apply for a multi-year flex account, they would  
4 also have a five-year period that they would be  
5 subject to?  
6 **A. That's correct.**  
7 Q. Now, you helped to develop multi-year flex  
8 accounts, do you believe that they're a useful  
9 tool to help with drought planning if you're a  
10 water right holder?  
11 **A. Yes.**  
12 Q. Purely from a conceptual standpoint, would a  
13 multi-year flex account be a potential  
14 alternative to the City's proposal?  
15 **A. It -- it's a pretty short term for a city to try**  
16 **to plan within five years. Chris Beightel and I**  
17 **actually looked at that. There was a city -- we**  
18 **had a meeting at the Groundwater Management**  
19 **District No. 2 when GMD staff had brought it up.**  
20 **And we take all considerations very seriously,**  
21 **and Chris Beightel and I actually ran through**  
22 **some scenarios and thought that it was a pretty**  
23 **short window of opportunity for the City.**  
24 Q. So I guess my question is was the main concern  
25 with multi-year flex accounts as used as a tool

1 that different for, let's say, a municipal user  
2 versus an irrigation user, they both have five  
3 years, correct?  
4 **A. That's correct.**  
5 Q. And as the regulations currently exist, it's a  
6 five-year time period, whether it's an  
7 industrial, a municipal, or an irrigation user;  
8 is that right?  
9 **A. That's right.**  
10 Q. And, in fact, is it also true that municipal  
11 irrigation, industrial users could all use or  
12 benefit from a multi-year flex account?  
13 **A. They're all eligible for a multi-year flex**  
14 **account.**  
15 Q. There was a discussion earlier about how the  
16 perfection period for a municipality is  
17 different than the perfection period for a  
18 individual user of a water right. Is that a  
19 true statement?  
20 **A. The time frame is different.**  
21 Q. So my question is with respect to at least a  
22 multi-year flex account, was it ever  
23 contemplated to have a different time period for  
24 a municipality versus an individual water right  
25 owner?

1 for the City, was the main concern with that  
2 based on the short time period, the five years?  
3 **A. Yes.**  
4 Q. Was there another concern identified, or was  
5 that the primary concern?  
6 **A. That was the primary concern with Chris and I.**  
7 Q. If the time period in a multi-year flex account,  
8 let's say, was changed from five years to, let's  
9 say, eight years or ten years for a  
10 municipality, would you perceive it as a more  
11 viable alternative for the City for drought  
12 planning?  
13 **A. I -- I can't answer that. I'd have to take some**  
14 **time to review it.**  
15 Q. As you're sitting here today, you're not  
16 prepared to render an opinion on that?  
17 **A. No, I'm not prepared.**  
18 Q. Was the Division of Water Resources, to your  
19 knowledge, asked by the City of Wichita to  
20 calculate what the City's existing water rights  
21 in their multi-year flex account quantities  
22 would be?  
23 **A. I don't remember the City asking us. I remember**  
24 **Chris and I did it, but I don't remember the**  
25 **City asking us.**

Page 1334

1 Q. So the Division of Water Resources did some of  
 2 these calculations as it relates to the City of  
 3 Wichita?  
 4 **A. Chris -- Chris Beightel and I looked at it.**  
 5 Q. Based on those calculations that were made, do  
 6 you have an opinion why five years would be too  
 7 short of a period to satisfy the City of  
 8 Wichita's needs?  
 9 **A. I think it had to do with the authorized**  
 10 **quantity, but I'm not prepared -- I'd have to go**  
 11 **back and review all of that, I'm not prepared.**  
 12 Q. Are there any notes or documents that you have  
 13 in the room here today that would help to  
 14 refresh your memory in that regard?  
 15 **A. I don't have it. I wasn't prepared to talk**  
 16 **about the multi-year flex accounts for the City.**  
 17 Q. During your deposition testimony, you mentioned  
 18 that recharge basins were a way that the City  
 19 could basically put water into the aquifer even  
 20 when the aquifer was full. Do you recall that  
 21 testimony?  
 22 **A. Yes.**  
 23 Q. So in other words, even if the aquifer is all  
 24 the way at the top of its capacity, completely  
 25 100 percent full, conceptually the City could

Page 1335

1 take overflow water from the Little Arkansas  
 2 River and put it into one of those recharge  
 3 basins; is that correct?  
 4 **A. That's correct.**  
 5 Q. So in other words, if the City -- did you not  
 6 also say in your deposition that if the City  
 7 wanted to capture more water currently from the  
 8 Little Arkansas River when it floods it could  
 9 build additional recharge basins?  
 10 **A. It -- yeah, they could.**  
 11 Q. So in other words, based on the City's current  
 12 rights and current infrastructure, one way they  
 13 could improve their infrastructure to get  
 14 overflows from the Little Arkansas River, even  
 15 when the aquifer is full, is to simply build  
 16 more recharge basins. Is that a true statement?  
 17 **A. They -- I believe that's true.**  
 18 Q. Is it true that you were involved in changing  
 19 the minimum index levels and when they were  
 20 measured to a different date?  
 21 **A. Yes.**  
 22 Q. What was the old date the minimum -- the old  
 23 date that those minimum index levels were  
 24 measured?  
 25 **A. I -- you know, I believe it was in the**

Page 1336

1 **summertime, but that's as close as I can get.**  
 2 Q. When did you change the date to when the new --  
 3 to when the new date, if you will, as far as  
 4 when the minimum index levels would be measured?  
 5 **A. I'd have to look at -- I do recall signing those**  
 6 **findings and orders, but I don't remember the**  
 7 **date.**  
 8 Q. Could you go to page 27 of your deposition,  
 9 which is Exhibit 20?  
 10 **A. Okay, I'm there. Two seven?**  
 11 Q. Page 27.  
 12 **A. Okay.**  
 13 Q. In looking at page 27 of your deposition  
 14 transcript, does that help to refresh your  
 15 memory as far as what those dates are?  
 16 **A. Yes, now it does.**  
 17 Q. What is the new date when those minimum index  
 18 levels are measured?  
 19 **A. In -- it's in January now.**  
 20 Q. And, in fact, you were involved in helping to  
 21 effectuate that regulation change; is that  
 22 correct?  
 23 **A. Correct.**  
 24 Q. What was the genesis behind the reason that you  
 25 wanted to change that measurement from being in

Page 1337

1 the summer to in January?  
 2 **A. In January, there's not a lot of irrigation**  
 3 **pumping; therefore, the aquifer is at more of a**  
 4 **static water level. So that's why we want the**  
 5 **measurement in January.**  
 6 Q. What is the impact as it relates to the City --  
 7 from the City's standpoint, how does it benefit  
 8 or disadvantage the City to have the measurement  
 9 in January versus in the summer?  
 10 **A. Well, I think it benefits everybody by having it**  
 11 **in the -- in the wintertime because of the**  
 12 **static water level. But if you -- if we take it**  
 13 **in the summertime and there's irrigation**  
 14 **pumping, or all pumping, it's going to be lower**  
 15 **and then the City may not be able to recover a**  
 16 **recharge credit if it's below the minimum index**  
 17 **cell level.**  
 18 Q. So in other words, by measuring in January, it  
 19 would make it easier, if you will, for the City  
 20 to recover its recharge credits?  
 21 **A. Yes.**  
 22 Q. So from that standpoint alone, measuring -- this  
 23 regulation change and measuring in January  
 24 benefited the City in the sense that it would be  
 25 easier for the City to then recover recharge

1 credits; is that true?  
2 **A. That's true.**  
3 Q. Yesterday we heard a discussion about the  
4 concept of aquifer maintenance credits. Do you  
5 recall that discussion?  
6 **A. Yes.**  
7 Q. And, in fact, we also heard a discussion about  
8 how this idea came into play. Do you recall  
9 that discussion?  
10 **A. Yes.**  
11 Q. And both Mr. McCormick and Mr. Clement were  
12 asked if they came up with the idea for an  
13 aquifer maintenance credit, and both of them  
14 said that that idea was floating around at Burns  
15 & Mac since as early as 2007 but they're not  
16 exactly sure how that concept was derived. Do  
17 you recall that discussion?  
18 **A. Yes.**  
19 Q. You have been with the Division of Water  
20 Resources now for 33 years, were you involved in  
21 formulating the concept of an aquifer  
22 maintenance credit?  
23 **A. I was part of the meetings. I mean, I -- I did**  
24 **not have the original idea or anything, but it**  
25 **was a group of us that discussed the aquifer**

1 **proposal came in, of course, but I don't know, a**  
2 **year before the proposal, two years before the**  
3 **proposal.**  
4 Q. Who first approached you with the idea for an  
5 aquifer maintenance credit?  
6 **A. Probably Brian Meier with Burns & McDonnell.**  
7 Q. Is Mr. Meier currently in the room? Was he in  
8 the room earlier today?  
9 **A. I saw him earlier today, yeah.**  
10 Q. So would that be the same Brian Meier that was  
11 in the room earlier today?  
12 **A. Yes.**  
13 Q. In your testimony just a moment ago when  
14 Mr. Oleen was asking you questions, you  
15 identified table 2-3, figure 10, and figure 11  
16 in the City proposal as portions of the proposal  
17 that you would talk about to people that would  
18 ask you what the City's proposal meant; is that  
19 true?  
20 **A. That's absolutely true.**  
21 Q. And you said that figure -- figure 11 had the  
22 contingency added and table 2-3 helped to  
23 conceptualize some of the numbers of the City's  
24 proposal. You would use those portions as you  
25 were trying to explain to the general public or

1 **maintenance credits.**  
2 Q. And when you say a group of us, who was in that  
3 initial group?  
4 **A. Division of Water Resources, Burns & Mac --**  
5 **Burns & McDonnell, and City of Wichita.**  
6 Q. When would those first discussions have  
7 occurred, to the best of your memory and  
8 recollection?  
9 **A. Well, they go clear back, you know, to -- and I**  
10 **don't know about Phase I, but I know they were**  
11 **talked about in Phase II because they talked**  
12 **about the passive recharge credits in Phase II.**  
13 **The aquifer maintenance credits got very serious**  
14 **when the infrastructure of Phase II was built,**  
15 **and we could then look at that as a functioning**  
16 **equivalent of a physical recharge credit.**  
17 **That's when -- that's when the Division, at**  
18 **least, felt it was appropriate to accept an AMC**  
19 **as a functional equivalent of physical recharge.**  
20 Q. So as you thought through that time line as far  
21 as when -- how those discussions played out,  
22 when do you believe that you first discussed the  
23 concept of an aquifer maintenance credit? If  
24 you had a guesstimate as far as a year?  
25 **A. If I had to guesstimate, it was before the**

1 others how the proposal would work; is that  
2 correct?  
3 **A. That's correct.**  
4 Q. Tell me, when you were explaining these aspects  
5 of the proposal, would you tell people that it  
6 was your belief that this proposal should be  
7 approved eventually by -- by a hearing officer?  
8 **A. I don't know if I ever took it that far. I**  
9 **would address their concerns of how many**  
10 **recharge credits -- how much was going to be**  
11 **pumped out of the aquifer and how the aquifer**  
12 **was going to be -- ended up, but I don't know if**  
13 **I ever went so far as to say this needs to be**  
14 **approved.**  
15 Q. Did you express that you were in favor of the  
16 City's proposal to the general public?  
17 **A. I -- no, I wouldn't have said it like that. I**  
18 **would say that how proposed, we don't feel that**  
19 **it's going to cause any impairment and it is**  
20 **better to go into a 1 percent drought with a**  
21 **full aquifer, that's how I would have said it.**  
22 Q. I would ask that you turn to DWR's Exhibit 4, if  
23 that's still in front of you?  
24 **A. Yeah, it's here.**  
25 Q. It's a September 18, 2017 letter from David

Page 1342

1 Barfield. On the last page of that letter,  
 2 right above the signature of Mr. Barfield, at  
 3 the top of that page in that first paragraph,  
 4 what does -- what did Mr. Barfield write with  
 5 respect to 110 percent, could you read that  
 6 aloud?  
 7 **A. Yes. We assume that the 110 percent assumption**  
 8 **for Cheney is based on the reservoir achieving**  
 9 **this level in non-drought years. If so, you**  
 10 **might state this basis.**  
 11 Q. So --  
 12 **A. This -- I don't want to interrupt you.**  
 13 Q. You're not interrupting me, go ahead.  
 14 **A. This was a letter back to the City asking them**  
 15 **to firm up the proposal, I believe.**  
 16 Q. So in other words, Mr. Barfield identified this  
 17 110 percent concern, if you will, for Cheney  
 18 Reservoir in this letter; is that right?  
 19 **A. That's correct.**  
 20 Q. Do you -- can you tell me what the City's  
 21 response was to Mr. Barfield addressing that 110  
 22 percent concern?  
 23 **A. Not without looking at it in a document.**  
 24 Q. Well, let me ask you this: Does the -- to the  
 25 best of your knowledge, does the Division of

Page 1343

1 Water Resources have any kind of document that  
 2 indicates whether or not the City responded to  
 3 that concern?  
 4 **A. Somewhere in our discussions, we determined that**  
 5 **that was actually 100 percent, if I -- and that**  
 6 **was a typographical error in that table.**  
 7 Q. Certainly during this hearing, we've discovered  
 8 that it should have been 100 percent, but I  
 9 guess my question is did you learn that it  
 10 should have been 100 percent prior to this  
 11 hearing, and if so, was that demonstrated in any  
 12 type of written document or correspondence from  
 13 the City?  
 14 **A. And I've got to be honest, I don't know if we**  
 15 **found out about the typographical error before**  
 16 **or after the wall was built, you know, because**  
 17 **we've got so many things going on. So -- and I**  
 18 **don't know if we have anything in writing, but**  
 19 **our -- this team understands that that was a**  
 20 **typographical error.**  
 21 Q. Would it also be -- we had this hearing start  
 22 back in December, would it also be a true  
 23 statement that you don't recall if that first  
 24 came to your attention back in the December  
 25 hearing or at some point prior? In fact, do you

Page 1344

1 not recall when this came to your attention?  
 2 **A. I -- I just know it's a typo, I don't recall**  
 3 **when it came to my attention.**  
 4 Q. So you don't know if the City, by way of letter  
 5 or other correspondence, responded to  
 6 Mr. Barfield back in 2017 with regard to that  
 7 error?  
 8 **A. I don't, no.**  
 9 Q. There were some other errors that were also  
 10 identified in the City's proposal, and you've  
 11 heard testimony in that regard; is that correct?  
 12 **A. That's correct.**  
 13 Q. Were any of those errors brought to your  
 14 attention prior to this hearing process  
 15 starting?  
 16 **A. I don't believe so.**  
 17 Q. Now, I'm interested in what work you personally  
 18 have done with regard to the City's modeling,  
 19 and I know that you testified a moment ago that  
 20 you're not really a modeler and so your work  
 21 would have been limited. And you can testify in  
 22 that regard. So my question is did you  
 23 personally analyze the City's -- any of the  
 24 City's MODSIM modeling?  
 25 **A. No.**

Page 1345

1 Q. Did you personally analyze any of the City's  
 2 MODFLOW modeling?  
 3 **A. No.**  
 4 Q. Did you personally do any kind of independent  
 5 testing of any of the City's modeling?  
 6 **A. No.**  
 7 Q. Did you perform any additional simulations to  
 8 try and understand if the City's modeling was  
 9 correct?  
 10 **A. No.**  
 11 Q. Did you spend an hour or even a minute analyzing  
 12 any of the City's modeling?  
 13 **A. Not the modeling, no.**  
 14 Q. So if -- so if I were to ask you questions about  
 15 aspects of the City's model with regard to  
 16 parameters of the model, you wouldn't have an  
 17 opinion on that, correct?  
 18 **A. No. No.**  
 19 Q. You wouldn't be aware of any modifications to  
 20 the model?  
 21 **A. No.**  
 22 Q. You wouldn't have awareness of any errors with  
 23 the modeling itself?  
 24 **A. No.**  
 25 Q. You wouldn't have any opinion as far as the

1 model's ability to account for minimum desirable  
2 streamflow?  
3 **A. No, I wouldn't.**  
4 Q. You wouldn't have any opinion with respect to  
5 how the City determined gradational losses?  
6 **A. No. I was part of the meetings, but, no,**  
7 **that -- that was a discussion between the**  
8 **modelers.**  
9 Q. Would you agree with me, though, at least for  
10 the record, that gradational losses are  
11 generally higher closer to the river?  
12 **A. Yes.**  
13 Q. And, in fact, in your second -- your answers to  
14 the District's second interrogatories, you  
15 stated that; is that correct?  
16 **A. Yes.**  
17 Q. And just for housekeeping purposes, I would ask  
18 that you turn to Exhibit 13 in the City's -- or  
19 in the District's notebooks.  
20 **A. I'm there.**  
21 Q. Would you agree that -- or can you read what the  
22 title of this document is for the record?  
23 **A. DWR's Responses to GMD's -- GMD2's Second Set of**  
24 **Interrogatories.**  
25 Q. And toward the end of that document there is a

1 opinion, he signed off on this brief and  
2 that's introduced as an exhibit and we  
3 didn't object, it seems to me that where  
4 Mr. Letourneau has signed off on answers to  
5 discovery requests as being his official  
6 opinions, that could also be part of the  
7 record as far as evidence in this case. To  
8 me, they're analogous.  
9 **PRESIDING OFFICER:** I'll allow it.  
10 **MR. OLEEN:** Then I would ask, Madam  
11 Hearing Officer, if we can have all  
12 discovery that every party signed and  
13 exchanged be entered into the record so we  
14 have a comprehensive record because I --  
15 just as Mr. Letourneau signed discovery,  
16 it's my understanding that GMD signed  
17 discovery of the City, the City signed  
18 discovery of the Intervenors, et cetera.  
19 I'm okay with everybody in or no one in,  
20 but I think I have a problem with only one  
21 person in.  
22 **MR. STUCKY:** You know, and my  
23 response to that is Mr. Oleen can try his  
24 case however he chooses; if he wants to  
25 introduce discovery as part of his exhibits

1 signature; is that, in fact, your signature at  
2 the end of that document?  
3 **A. Yes.**  
4 **MR. STUCKY:** I would move to admit  
5 the District's Exhibit 13.  
6 **MR. OLEEN:** I respectfully object.  
7 Unless Mr. Stucky is going to use this for  
8 impeachment purposes, I don't think it's  
9 appropriate. If we're going to enter into  
10 evidence this set of discovery, then  
11 everybody's issues and answers to discovery  
12 in this case. So if it's for impeachment  
13 purposes, then I understand; but if not,  
14 then I didn't think it was appropriate to  
15 wholesale be admitting discovery documents  
16 into evidence.  
17 **PRESIDING OFFICER:** You wish to  
18 respond?  
19 **MR. STUCKY:** Yes, I think we're --  
20 if Mr. Letourneau signed off on these being  
21 his official opinions, whether it be by  
22 discovery -- and, you know, Mr. Oleen  
23 introduced a brief where Mr. Letourneau  
24 signed off on a brief as one of his  
25 exhibits, and that was his official

1 when he tries his case, that's perfectly  
2 fine with me, he's -- he's entitled to  
3 that.  
4 We have produced these exhibits in  
5 advance to all the parties, and you will  
6 see in our exhibits that, in fact, frankly,  
7 we have even our answers to some of the  
8 City's discovery in our exhibits, so we do  
9 have most of the discovery in our exhibits.  
10 But we have prepared these as our exhibits.  
11 However Mr. Oleen wants to handle his  
12 exhibits is just fine with me. If he wants  
13 to introduce additional discovery, that's  
14 fine, potentially, subject to whatever that  
15 discovery is. But we're asking that we be  
16 allowed to admit it in our case in chief.  
17 **PRESIDING OFFICER:** Is there any  
18 comment from the other attorneys? Since  
19 Mr. Oleen is suggesting admitting all  
20 discovery?  
21 **MS. WENDLING:** I have a question, is  
22 it all discovery or just the specific,  
23 like, interrogatory responses, because all  
24 discovery is a voluminous amount of  
25 information?

Page 1350

1 **MR. OLEEN:** I guess I'm not  
 2 proposing that we admit exchanged  
 3 documents, but if we're going to -- it's my  
 4 understanding that you don't enter into  
 5 evidence signed discovery except for  
 6 impeachment purposes because the witness is  
 7 here and he can answer your question. If  
 8 he answers it in a contrary way to your  
 9 belief, then you can attempt to impeach him  
 10 through his signed statements. But I don't  
 11 have a problem with what Mr. Letourneau  
 12 signed from a subject matter.  
 13 So to answer Ms. Wendling's question, I  
 14 wouldn't propose that all exchanged  
 15 documents be admitted into the hearing  
 16 record, but I would propose that all  
 17 answered interrogatories, requests for  
 18 admission, I guess just those two, of every  
 19 party be put into the record.  
 20 **MR. STUCKY:** And we don't --  
 21 **PRESIDING OFFICER:** Mr. McLeod, I'd  
 22 like to hear from you.  
 23 **MR. MCLEOD:** Yes, thank you. First,  
 24 let me say, I don't object to Mr. Stucky's  
 25 request to admit these, and I don't object

Page 1351

1 to Mr. Oleen's request to admit the  
 2 interrogatories and responses of the other  
 3 parties. And as far as the technical  
 4 aspects, Mr. Stucky is not trying his case  
 5 right now, he has the witness on cross, but  
 6 this is an administrative hearing.  
 7 Mr. Oleen's point is good, most courts  
 8 would say it's cumulative, but it's in --  
 9 it's in any hearing officer's or judge's  
 10 discretion to admit evidence that's  
 11 cumulative. I don't see the harm in doing  
 12 it. Technically, it may not be correct to  
 13 do it on cross except for impeachment.  
 14 We're in an administrative hearing, I don't  
 15 see the harm in allowing it.  
 16 **PRESIDING OFFICER:** So I'm assuming  
 17 behind all of this, you're not doing this  
 18 for purposes of impeachment?  
 19 **MR. STUCKY:** It's -- it's for both.  
 20 There's times when I'll introduce it as  
 21 Mr. Letourneau's official opinion, and  
 22 there's times I may use it for impeachment,  
 23 it's both. Part of the reason I think it's  
 24 beneficial to have it as exhibits is  
 25 they're numbered in our exhibit notebooks

Page 1352

1 and it makes it easy for the witness to  
 2 reference, and so it will create efficiency  
 3 in this hearing. Rather than me having to  
 4 walk up to the witness every few minutes to  
 5 point to a place in our discovery, we  
 6 thought that since this was an  
 7 administrative hearing it would be logical  
 8 to have all the discovery as exhibits so I  
 9 could quickly reference them to the witness  
 10 and it would make this hearing process more  
 11 efficient.  
 12 Now, with regard to what Mr. Oleen said,  
 13 we don't have any problem if all  
 14 interrogatories and all requests for  
 15 admissions in this case be considered by  
 16 the hearing officer as evidence in this  
 17 case, we don't have an objection to that.  
 18 That seems like a reasonable request, we  
 19 don't have any objection to that request.  
 20 **PRESIDING OFFICER:** I'm a little  
 21 concerned about just a blanket admission  
 22 without specific identifiable documents in  
 23 front of me. Admission by category is not  
 24 something I'm particularly comfortable  
 25 with. This is an administrative hearing,

Page 1353

1 the rules are a little more relaxed than  
 2 normal. Generally, I do not want  
 3 cumulative evidence, so I am hoping that  
 4 that is not something that is going to  
 5 become a problem with this. At this point,  
 6 I will allow these in. Other parties are  
 7 free to request admission of other items of  
 8 discovery should they want to, and we'll  
 9 address that as they come up, and I will  
 10 not limit that strictly to impeachment  
 11 context because, again, this is an  
 12 administrative hearing. Mr. Oleen.  
 13 **MR. OLEEN:** If I may add one more  
 14 thing, and maybe it was an intentional  
 15 choice of words, but Mr. Stucky referred to  
 16 this discovery as being Mr. Letourneau's, I  
 17 think maybe he said official opinion  
 18 testimony. And I just want to point out  
 19 that DWR's official opinion testimony is  
 20 the written testimony that was submitted.  
 21 What -- what was answered in the  
 22 discovery that the parties exchanged  
 23 happened before. I don't -- I can't recall  
 24 if there are changes in DWR's opinions from  
 25 the time they answered this written

1 discovery to the time they submitted their  
2 formal written testimony with the presiding  
3 officer.  
4 I guess that's a reason why I don't like  
5 this being admitted except for impeachment  
6 purposes because I think it would be an  
7 incorrect assumption to the extent there's  
8 differences in Mr. Letourneau's answers  
9 between the written answers and the formal  
10 testimony that he submitted, that could  
11 have occurred because of changes or  
12 information learned in the interim.  
13 So that's why I think it's really best  
14 for any questions that Mr. Stucky has to be  
15 asked of the witness today on the hearing  
16 instead of assuming that these questions  
17 still apply today.  
18 **PRESIDING OFFICER:** How is that  
19 different from impeachment?  
20 **MR. OLEEN:** Well, because it gives  
21 him the chance to say that circumstances --  
22 different information was learned from the  
23 point I answered this way versus how I did  
24 in the written testimony. And I guess  
25 if -- if Mr. Letourneau will still have

1 for the record what those are, if you would  
2 like.  
3 **PRESIDING OFFICER:** Please do.  
4 **MR. STUCKY:** Exhibit Number 3 is the  
5 Equus Beds answers to the City's  
6 interrogatories. Exhibit Number 4 is the  
7 Equus Beds answers to the City's second  
8 interrogatories. Exhibit Number 5 is the  
9 District's answers to the City's request  
10 for -- requests for admissions.  
11 Exhibit 6 is the City's answers to the  
12 District's interrogatories. Exhibit 7 is  
13 the City's answers to the District's  
14 request for admissions. Exhibit 8 is the  
15 City's answers to the District's second set  
16 of interrogatories. Exhibit 9 is the  
17 City's answers to the District's second set  
18 of requests for admissions. Exhibit 10 is  
19 the City's supplemental answers to the  
20 District's second requests for admissions.  
21 Exhibit 11 is the District's answers --  
22 or, I'm sorry, Exhibit 11 is the Division  
23 of Water Resources' answers to the  
24 District's interrogatories. Exhibit  
25 Number 12 is the Division of Water

1 that opportunity, then -- then fine. But I  
2 don't want the hearing officer to make  
3 judgments without giving Mr. Letourneau  
4 that opportunity to perhaps explain  
5 differences, if there are differences, I  
6 don't know.  
7 **PRESIDING OFFICER:** I agree with you  
8 that that opportunity should be provided.  
9 So to the extent that there are  
10 discrepancies, then Mr. Letourneau will be  
11 given an opportunity to explain those.  
12 Does that help resolve your concern?  
13 **MR. OLEEN:** Yes, thank you.  
14 **MR. STUCKY:** And I also agree that  
15 if we introduce all this discovery, it  
16 would be the onus on each of the attorneys  
17 for the parties to review that discovery  
18 and determine whether or not there's  
19 clarifying questions that need to be asked.  
20 But to Mr. Oleen's original point, if we  
21 want to introduce all the discovery, which  
22 would be the interrogatories and the  
23 requests for admissions, I would ask that  
24 the District's Exhibits 3 through 19 be  
25 admitted into evidence. And I can state

1 Resources' answers to the District's  
2 requests for admissions. Exhibit Number 13  
3 is the Division of Water Resources' answers  
4 to the District's second set of  
5 interrogatories. Exhibit Number 14 is the  
6 Division of Water Resources' answers to the  
7 District's second set of requests for  
8 admissions. Exhibit Number 15 is the  
9 Division of Water Resources' amended and  
10 supplemental response to interrogatory  
11 number 16 of the District.  
12 Exhibit Number 16 is the Intervenor's  
13 answers to the City's interrogatories.  
14 Exhibit Number 17 is the Intervenor's  
15 supplemental answers to the City's  
16 interrogatories. Exhibit Number 18 is the  
17 City's answers to the Intervenor's  
18 interrogatories. And Exhibit 19 is the  
19 Division of Water Resources' answers to the  
20 Intervenor's interrogatories. So I think  
21 that should qualify as all the discovery  
22 that Mr. Oleen asked to be admitted just a  
23 moment ago.  
24 **PRESIDING OFFICER:** Any comment?  
25 **MR. OLEEN:** If that's your

Page 1358

1 reasonable belief that that is all of the  
 2 interrogatories and requests for admissions  
 3 that were exchanged by all the parties,  
 4 then yes.  
 5 **PRESIDING OFFICER:** Any other  
 6 comments, concerns? Okay. Hearing none,  
 7 GMD's Exhibits 3 through and including 19  
 8 will be admitted.  
 9 **MS. WENDLING:** Would this be an okay  
 10 time for a break?  
 11 **PRESIDING OFFICER:** That is a good  
 12 idea. It is 20 till 4:00, let's take a  
 13 ten-minute break.  
 14 (Thereupon, a recess was taken;  
 15 whereupon, the following was had.)  
 16 **PRESIDING OFFICER:** Okay. We're  
 17 back on the record. Mr. Stucky.  
 18 **MR. STUCKY:** Thank you, Your Honor.  
 19 **BY MR. STUCKY:**  
 20 Q. Earlier today, I asked you questions about  
 21 whether or not you agreed that your deposition  
 22 testimony was correct. Now, it's been pointed  
 23 to my attention that -- pointed out to my  
 24 attention that throughout your deposition  
 25 testimony transcript Mr. Boese was actually

Page 1359

1 referred to as Mrs. Boese throughout your  
 2 testimony in that transcript. To the extent  
 3 that Mr. Boese is referred to throughout that  
 4 transcript as Mrs. Boese, do you agree that  
 5 that's a correction that could be made to your  
 6 transcript?  
 7 **A. That's a correction that could be made, yes.**  
 8 Q. So if I'm to ask you a question about something  
 9 that Mrs. Boese said, you would understand that  
 10 to be Mr. Boese; is that correct?  
 11 **A. That's correct.**  
 12 Q. Just a moment ago before we had a long  
 13 discussion about which exhibits should be  
 14 introduced, I was asking you what kind of  
 15 modeling that you personally had performed. Do  
 16 you recall that discussion?  
 17 **A. Yes.**  
 18 Q. And I asked you if you had done any modeling  
 19 with respect to minimum desirable streamflow,  
 20 gradational losses, things of that nature,  
 21 correct?  
 22 **A. That's correct.**  
 23 Q. And, in fact, you answered that you hadn't done  
 24 any modeling in that regard?  
 25 **A. That's correct.**

Page 1360

1 Q. Is it also true that you haven't done any  
 2 modeling to determine whether or not the City's  
 3 proposal would impact water quality?  
 4 **A. That's correct.**  
 5 Q. Would you also agree that you haven't done any  
 6 modeling personally to determine whether or not  
 7 the City's proposal would result in impairment?  
 8 **A. That's correct.**  
 9 Q. So those questions that I asked you before had  
 10 to do with what you personally, Lane Letourneau,  
 11 did with respect to analyzing the City's model.  
 12 I'm now interested in your knowledge with  
 13 respect to what modeling the Division of Water  
 14 Resources did or what analysis the Division of  
 15 Water Resources and your colleagues did with  
 16 respect to the City's modeling. Do you know,  
 17 first of all, whether or not the Division of  
 18 Water Resources did any type of independent data  
 19 collection to verify any of the City's modeling?  
 20 **A. I don't know, I don't know if they did.**  
 21 Q. Could you go to Exhibit 21 in your notebook  
 22 before you? If you could go to Exhibit 20,  
 23 rather.  
 24 **A. Oh, yep.**  
 25 Q. And if you could now flip to page 51 of that

Page 1361

1 document. Could you read for me the question  
 2 that begins on line 14 and your answer which  
 3 ends on line 17?  
 4 **A. Line 14, question: Okay. Did DWR do any  
 5 independent data collection regarding evaluating  
 6 Wichita's proposal?**  
 7 Q. And what was your answer?  
 8 **A. No.**  
 9 Q. So in other words, is it your testimony today  
 10 that the Division of Water Resources didn't  
 11 perform any kind of independent data collection  
 12 to evaluate the City's proposal?  
 13 **A. Yeah, I don't -- I don't know if they did, so I  
 14 don't -- my answer would be no.**  
 15 Q. And, in fact, the Division of Water Resources  
 16 didn't perform any types of independent  
 17 measurements. Is that a true statement as well?  
 18 **A. That's true.**  
 19 Q. And, in fact, the Division of Water Resources  
 20 didn't perform any independent calculations to  
 21 analyze the City's proposal; is that also true?  
 22 **A. Well, I don't know about the calculations.**  
 23 Q. I would ask -- could you read on page 50 -- on  
 24 page 51, could you read the question that begins  
 25 on line 14 -- I'm sorry, on line 20 and then the

1 answer that starts on line 25?  
2 **A. The --**  
3 Q. The question starts on line 18, sorry, and the  
4 answer starts on line 20, could you read that,  
5 please.  
6 **A. Yes, absolutely. Question is, did they test**  
7 **wells, check any other kind of measurements out**  
8 **there?**  
9 Q. And what was your answer?  
10 **A. No. We didn't do any well testing. If there**  
11 **was some water level measurements out there that**  
12 **we take quarterly or on an annual level, we**  
13 **would have -- we would have done that, but I'm**  
14 **not sure if there are any of those.**  
15 Q. So to the best of your knowledge and belief, are  
16 you aware of any kind of independent  
17 measurements or calculations that were performed  
18 by the Division of Water Resources to analyze  
19 the City's model?  
20 **A. I know that our field office did not go out and**  
21 **take any additional well measurements. I can't**  
22 **answer if one of our modelers had done any**  
23 **calculations.**  
24 Q. On the other hand, if the District has taken  
25 independent measurements or done independent

1 **A. I would have to look at it. I'm -- I'm familiar**  
2 **it's a GMD2 regulation, but I'd have to look at**  
3 **it.**  
4 Q. Could you go to Exhibit 24? Are you on that  
5 regulation now?  
6 **A. Yes. Oh, no, give me the number again, I'm**  
7 **sorry.**  
8 Q. 5-22-14.  
9 **A. Okay, I'm there now.**  
10 Q. With respect to that regulation, what is it?  
11 **A. K.A.R. 5-22-14 is maximum reasonable quantity**  
12 **for beneficial use.**  
13 Q. And, generally, what does this regulation  
14 accomplish?  
15 **A. Well, we want to make sure that all new**  
16 **appropriations are for a reasonable quantity.**  
17 Q. When a municipality applies for a water right  
18 and a quantity that they're perceiving as a  
19 reasonable quantity, are they allowed to, at  
20 least to a degree, project some growth into that  
21 demand?  
22 **A. We call it population demand growth, yes.**  
23 Q. Does this K.A.R., does this regulation put a  
24 time limitation on how far out the City can  
25 project its demand?

1 calculations, would you have, at least as you're  
2 sitting here today, reason to doubt those  
3 measurements and calculations?  
4 **A. No.**  
5 Q. Do you know what analysis the Division of Water  
6 Resources did of the City's drought modeling, in  
7 other words the MODSIM modeling?  
8 **A. I don't know.**  
9 Q. In other words, is it your position that you're  
10 not aware of any independent modeling that was  
11 done to verify the City's drought modeling?  
12 **A. You know, that's a question for our modeling**  
13 **team, I don't know what they did.**  
14 Q. But you wouldn't have been involved in any of  
15 that modeling, correct?  
16 **A. That's correct.**  
17 Q. You heard the City's testimony that they're  
18 basically planning for a drought by -- by 2060,  
19 as far out as 2060; is that right?  
20 **A. The projections are out to 2060, correct.**  
21 Q. So roughly how many year period is that?  
22 **A. From now?**  
23 Q. From now?  
24 **A. 40 years.**  
25 Q. Are you familiar with K.A.R. 5-22-14(f)?

1 **A. Well --**  
2 Q. I would ask that you flip to the next page and  
3 look at subsection (f).  
4 **A. Yeah, unless the applicant demonstrates a**  
5 **population deviation from actual population**  
6 **trends, a reasonable quantity of water for**  
7 **municipal use shall not exceed the lesser of**  
8 **either of the following. And as I read on in**  
9 **item number 2, population for the 20th year**  
10 **after the application is filed, so this one --**  
11 **this regulation lays out a 20-year population.**  
12 Q. So at least if the City were applying for a new  
13 application for a water right in this case, and  
14 I understand that that's not what their intent  
15 is, but if they were applying for a new  
16 application for a water right, it would have a  
17 20-year limit on their ability to project their  
18 needs. Is that a true statement?  
19 **A. That's a true statement.**  
20 Q. However, in this case, where the City has not  
21 filed for a new application for a water right,  
22 they're attempting to project out 40 years; is  
23 that correct?  
24 **A. That's correct, on already approved applications**  
25 **for drought modeling.**

Page 1366

1 Q. So if a new application is conditioned by only a  
 2 20-year period, projection period, would a  
 3 modification of that application also be limited  
 4 by that 20-year period, or is it your testimony  
 5 that you can project out as far as you want if  
 6 you're a municipality?  
 7 **A. Well, you can -- we have municipalities project  
 8 out farther than 20 years. I mean, I know -- I  
 9 know we have them do that, but this proposal for  
 10 the -- the duration of the drought is different  
 11 than a new application, in my opinion.**  
 12 Q. Where were these other municipalities that  
 13 attempted to project out for more than 20 years,  
 14 can you name them?  
 15 **A. The most recent one, McPherson comes to mind.  
 16 And then -- well, there's -- I know we have some  
 17 other ones, but the most recent one, David, is  
 18 McPherson comes to mind.**  
 19 Q. With respect to McPherson, do they have  
 20 additional restrictions where it needs to be  
 21 looked at every ten years, for example?  
 22 **A. Yeah, absolutely. Yeah, there's a review  
 23 period.**  
 24 Q. So as far as just a blanket projection out a  
 25 number of years, that didn't occur with respect

Page 1367

1 to McPherson, correct?  
 2 **A. No, no, there's some -- there's some caveats  
 3 with that.**  
 4 Q. So in other words, the City attempting to  
 5 project out 40 years, at least from your  
 6 33 years of experience with -- with the Division  
 7 of Water Resources, would that at least be  
 8 unique in your experience?  
 9 **A. I don't think it's unique. I mean, there's been  
 10 other ones do -- that do 40 and 50 years; I just  
 11 can't think of them off the top of my head  
 12 so ...**  
 13 Q. But at least from a time standpoint, the  
 14 40 years that the City is trying to project out  
 15 stands in stark juxtaposition to the 20 years  
 16 that is identified in -- as a time limitation  
 17 for a new application. Would you at least agree  
 18 with that statement?  
 19 **A. I agree with that, but I need to add a little  
 20 something to that. Currently, we do -- will do  
 21 an approval with a perfection period of  
 22 20 years. But in that particular perfection  
 23 rule, we will allow an extension out to 40 years  
 24 for perfection in that particular rule as long  
 25 as the City's making strides, or whatever, for a**

Page 1368

1 **40-year projection.**  
 2 Q. Yesterday, and so much time has passed, I'm  
 3 forgetting if it was even this morning, there  
 4 was a discussion about other sources of supply  
 5 for the City, and there was a discussion about  
 6 Bentley reserve well field and the E&S well  
 7 field?  
 8 **A. Uh-huh, correct.**  
 9 Q. Do you believe that either of those sources are  
 10 firm sources of supply to the City?  
 11 **A. I don't think Bentley is. Bentley -- while  
 12 Bentley does have the water supply wells there  
 13 with native water rights, I think the quality's  
 14 poor. But I think the other -- the Wichita --  
 15 I'll call that other one the Wichita well field,  
 16 I think that is a firm -- I mean, there's native  
 17 water rights available at both of those for the  
 18 City, but I think the quantities are pretty  
 19 small.**  
 20 Q. So at least as you're sitting here today and  
 21 based on your independent review and opinion,  
 22 even though the quantities are small, would you  
 23 at least agree that those are additional sources  
 24 of supply that would be available to the City?  
 25 **A. They are additional sources, yes.**

Page 1369

1 Q. Do you believe that it would have been best if  
 2 the City had included those additional sources  
 3 of supply in the modeling that the City  
 4 performed for that reason?  
 5 **A. Yeah, I think the quantities are so small, I  
 6 don't know if it would have made a difference  
 7 either way, but they sure could have, yeah.**  
 8 Q. I asked you just a moment ago about the modeling  
 9 that the Division of Water Resources did with  
 10 respect to MODSIM. Do you know if the Division  
 11 of Water Resources used Vistas at all?  
 12 **A. I -- I don't know in this case, but I know Sam  
 13 Perkins uses them, he talks about them.**  
 14 Q. And I was told that Vistas is an Excel  
 15 spreadsheet on steroids basically. Was that  
 16 utilized to -- by the Division of Water  
 17 Resources, to your knowledge, to help analyze  
 18 any of the modeling done by the City that's  
 19 before us today?  
 20 **A. I don't know.**  
 21 Q. With respect to the MODFLOW model, who looked at  
 22 the MODFLOW model for -- on behalf of the  
 23 Division of Water Resources, who looked at the  
 24 City's MODFLOW modeling and analyzed it?  
 25 **A. Well, it started with Jim Bagley, but I don't --**

1 then I don't know how much Sam was involved.  
2 But any MODFLOW modeling, we let Sam look at it,  
3 Sam Perkins. But I ...  
4 Q. I would ask that you turn in our first notebook  
5 to Exhibit 11 which is the Division of Water  
6 Resources' answers to our first set of  
7 interrogatories. Tell me when you're on that  
8 document.  
9 A. I'm -- I'm there, yes, thank you.  
10 Q. Would you turn with me to page 22?  
11 PRESIDING OFFICER: I'm sorry, which  
12 exhibit?  
13 MR. STUCKY: Exhibit -- Exhibit 11.  
14 BY MR. STUCKY:  
15 Q. If you could turn with me to page 11, which is  
16 question number 22.  
17 A. Okay.  
18 Q. There was a question asked, you were asked a  
19 question with respect to the interrogatories  
20 that you signed off on, you were asked a  
21 question regarding who on behalf of the Division  
22 of Water Resources would have, at least, looked  
23 at the modeling performed by the City, and  
24 there's a list of individuals that are given  
25 there. Could you tell me who those individuals

1 at it for the DWR.  
2 MR. OLEEN: Then if it's just to  
3 refresh memory type situation, then I -- my  
4 objection is essentially inapplicable.  
5 PRESIDING OFFICER: Okay. Is there  
6 a list, I'm not seeing on my exhibit a list  
7 of names?  
8 MR. STUCKY: Exhibit 11, page 11.  
9 PRESIDING OFFICER: Oh, at the very  
10 bottom.  
11 MR. STUCKY: At the very bottom.  
12 BY MR. STUCKY:  
13 Q. I asked you a moment ago who the individuals  
14 were that reviewed the City's modeling, and the  
15 name that you gave me before, I think, was just  
16 Jim Bagley. Were there other individuals that  
17 would have also looked at the City's modeling?  
18 A. Yes, Jim Bagley, David Barfield, Chris Beightel,  
19 and Ginger Pugh.  
20 Q. And with respect to the modeling that was  
21 performed, was it aimed in merely assisting the  
22 City in determining whether or not the modeling  
23 was performed correctly?  
24 A. Yes, based on this answer, it is.  
25 MR. OLEEN: Then I would -- I

1 are?  
2 A. Yes.  
3 MR. OLEEN: I'm just going to object  
4 to point out that DWR's answer to this  
5 interrogatory, like many of the GMD's  
6 discovery requests that we thought were  
7 objectionable in certain ways, was objected  
8 to by me, and so for any of these requests  
9 for admissions or interrogatories for which  
10 Mr. Stucky is attempting to read into  
11 evidence, I think my objection should  
12 stand, if there is such an objection. This  
13 is another reason why we don't typically  
14 read discovery into hearings because there  
15 can be unresolved objections to the  
16 questions. But so long as my objection is  
17 preserved and my objection can be ruled  
18 upon, if necessary, then I'm okay with us  
19 discussion -- discussing these.  
20 MR. STUCKY: In this case, I will  
21 tell you, to get inside my head in this  
22 situation, I'm not going to ask him to read  
23 any part of his answer. I'm doing it  
24 purely to refresh his memory as far as  
25 listing who the modelers were that looked

1 would -- I would say if the witness is  
2 going to say my answer is -- if his answer  
3 today is whatever he says orally, then my  
4 objection doesn't apply. If the witness is  
5 just reading his answer -- I want a  
6 distinction between is the witness saying  
7 this today, or is he saying it back then?  
8 If he's saying it today because it's still  
9 true from what he said back then, then  
10 fine. If he's just reading his answer and  
11 saying, I said this back then, then I have  
12 a standing objection to the question. I  
13 know that's kind of confusing but ...  
14 PRESIDING OFFICER: Well, this gets  
15 back to refreshing a memory.  
16 MR. OLEEN: Okay, well, his response  
17 was, I think he said it says here whatever,  
18 and --  
19 A. Oh, okay.  
20 MR. OLEEN: -- and if that's -- if  
21 what is said there is still what's true  
22 today and he's going to orally say that,  
23 then -- then okay.  
24 MR. STUCKY: I'll try and respond,  
25 I'm a little confused what the objection

Page 1374

1 is, but as I understand it, if I was to use  
 2 this only for impeachment purposes, then I  
 3 could have him read his answer, but to the  
 4 extent his answer is to be utilized as  
 5 evidence, then he can no longer read his  
 6 answer, is that -- is that the position?  
 7 Because it's my perspective that  
 8 Mr. Oleen can follow along with all the  
 9 questions I'm asking, and it's his witness,  
 10 if he believes that I've misled the witness  
 11 or that these opinions somehow have changed  
 12 with respect to this witness, either the  
 13 witness can correct that opinion,  
 14 number one, or Mr. Oleen can go back with a  
 15 redirect and clarify with that redirect.  
 16 From my perspective, that's how that would  
 17 be addressed.  
 18 **MR. OLEEN:** I would just hope that  
 19 we ask the witness a question, if he  
 20 doesn't know the answer and he needs  
 21 something to refresh his memory, then we  
 22 can refer to the written discovery. If  
 23 that refreshes his memory, then he can say  
 24 what the answer is to the oral question.  
 25 If we're doing that process, then fine.

Page 1375

1 I just don't -- I don't want the witness  
 2 to think that he has to read into evidence  
 3 what's written down here because he doesn't  
 4 have to do that in response to an oral  
 5 question. We're here -- we're here to  
 6 answer Mr. Stucky's oral questions. And I  
 7 don't want the witness to be confused.  
 8 **MR. STUCKY:** And my response is  
 9 I've -- with due respect, I've had a lot of  
 10 trials before and when I'm asking witnesses  
 11 in a trial, if I ask them to read a part of  
 12 the record or a part of an exhibit, when  
 13 the witness is under oath and it's my  
 14 questioning, they generally have to read  
 15 that exhibit if it's something I ask them  
 16 to do. And so if I'm the one asking the  
 17 questions, I think, and if it's a  
 18 reasonable basis, then I'm asking them to  
 19 read a part of a question or an answer, I  
 20 think that that could be made part of the  
 21 record.  
 22 **MR. OLEEN:** But the problem,  
 23 Mr. Stucky, is that I have objections to  
 24 your written questions that you're  
 25 circumventing by attempting to have the

Page 1376

1 witness read into evidence his answer to  
 2 your written question. I have a standing  
 3 objection to the written question. I don't  
 4 necessarily have a standing objection to  
 5 your oral question. I have to stand up and  
 6 say that today.  
 7 And what I'm concerned with the way  
 8 we're using this is that my written  
 9 objections to the question are being  
 10 circumvented by attempting to have the  
 11 witness read into evidence what he said.  
 12 He's -- he's supposed to answer the  
 13 questions orally.  
 14 I don't mean to make a big deal about  
 15 something that -- I don't even know what's  
 16 all in this answer yet, I haven't fully  
 17 read it, I am just concerned that my  
 18 written objections to these written  
 19 discovery questions are being circumvented  
 20 by how we're doing this today.  
 21 **MR. STUCKY:** Just for the benefit of  
 22 everybody in the room, I'll try and ask  
 23 questions in such a way that it satisfies  
 24 Mr. Oleen, if I may. I'll just proceed in  
 25 that fashion for the most part.

Page 1377

1 **PRESIDING OFFICER:** That would be  
 2 fine. I'd also just pull us back to a few  
 3 minutes ago when you were given assurances,  
 4 Mr. Oleen, that if there were any  
 5 differences in Mr. Letourneau's answers  
 6 from then to now that he would be given the  
 7 opportunity to explain why they may be  
 8 different, so that still remains in effect.  
 9 And I don't believe you're waiving any  
 10 objections that are in the record. These  
 11 are admitted exhibits, and as any other  
 12 exhibits, they could be read into the  
 13 record. That doesn't mean, from my point  
 14 of view -- if a witness is reading  
 15 something into the record, he is clearly  
 16 reading an exhibit into the record. That  
 17 doesn't necessarily mean that witness now  
 18 attests to that as their testimony. Does  
 19 that help you at all?  
 20 **MR. OLEEN:** I think so. Yes.  
 21 **PRESIDING OFFICER:** And  
 22 Mr. Letourneau is free to explain when you  
 23 are questioning him again if he agrees now  
 24 with what this says in this exhibit.  
 25 **MR. OLEEN:** Okay.

1 **PRESIDING OFFICER:** Okay.  
2 Mr. Stucky.  
3 **BY MR. STUCKY:**  
4 Q. Prior to the objections and the discussion  
5 regarding the objections, I asked you questions  
6 with regard to any kind of independent modeling  
7 or analysis that the Division of Water Resources  
8 did to verify the City's modeling. Do you  
9 recall some of those questions?  
10 **A. Yes.**  
11 Q. And if you were to look at the answer to  
12 interrogatory number 22, do you believe that the  
13 Division of Water Resources attempted to  
14 independently replicate the modeling work of the  
15 City's consultants?  
16 **A. No.**  
17 Q. And, in fact, based on having looked at this  
18 answer, is it your belief that the Division of  
19 Water Resources did independent modeling work or  
20 tried to analyze in great detail the City's  
21 modeling?  
22 **A. No, we agreed with the model.**  
23 Q. And does your answer, at least, to this  
24 interrogatory suggest that the scope of the  
25 Division of Water Resources' analysis of the

1 modeling was to look at it, along with the  
2 inputs, to determine whether or not they  
3 appeared reasonable?  
4 **A. Yes.**  
5 Q. And, in fact, is it your belief that the  
6 Division of Water Resources would not have  
7 attempted to pick apart the City's modeling?  
8 **A. That's correct.**  
9 Q. Would you also agree that with respect to any of  
10 the City's modeling, the Division of Water  
11 Resources never modeled or considered water  
12 quality as it relates to the City's proposal?  
13 **MR. OLEEN:** Objection, asked and  
14 answered.  
15 **MR. STUCKY:** Madam Hearing Officer,  
16 previously, I asked him if Mr. Letourneau  
17 personally had modeled or considered water  
18 quality for him personally. Now I'm asking  
19 for the Division of Water Resources as a  
20 whole, so it's a separate line of  
21 questioning.  
22 **PRESIDING OFFICER:** Okay. Could you  
23 say it again, the question you're asking?  
24 **BY MR. STUCKY:**  
25 Q. Did the Division of Water Resources -- the

1 Division of Water Resources never performed any  
2 kind of modeling to determine whether or not the  
3 City's proposal would impact water quality,  
4 correct?  
5 **A. That's correct, because the proposal did not --**  
6 **was not making adjustments to Phase I.**  
7 Q. And once again, the Division of Water Resources  
8 never performed any types of independent  
9 simulations as it relates to the City's proposal  
10 or the City's modeling, correct?  
11 **A. Not that I'm aware of.**  
12 Q. I would ask that you turn to Exhibit 20. If you  
13 were to look at page 53, line 3 of Exhibit 20,  
14 would you agree that you at least answered that  
15 your program or your division didn't perform any  
16 type of modeling as it related to the City's  
17 proposal?  
18 **A. That's correct, the water appropriation program**  
19 **did not.**  
20 Q. But, ultimately, whose division of -- when we're  
21 talking about divisions of the Division of Water  
22 Resources, that sounds somewhat confusing, whose  
23 division would be responsible for ultimately  
24 making a decision about whether or not to  
25 recommend the City's proposal that's before us

1 today, whose division would that be?  
2 **A. Water management services, the water management**  
3 **services program. Because the chief engineer is**  
4 **in that program.**  
5 Q. Who is -- and which division or program are you  
6 a part of?  
7 **A. I'm a part of the water appropriation program.**  
8 Q. So it's your testimony that it's a separate  
9 division, if you will, that would make the  
10 recommendation whether or not the City's  
11 proposal should be approved?  
12 **A. It's a team of us. It's -- I understand your**  
13 **question now. It's both programs, water**  
14 **management services and water appropriation.**  
15 Q. But on behalf of water appropriation, would it  
16 generally be you that would make a  
17 recommendation either in favor or against the  
18 City's proposal?  
19 **A. Yes. I'm -- I'm responsible for the -- yes.**  
20 **Yeah, I would be responsible for that.**  
21 Q. So purely as it relates to a recommendation  
22 either for or against the City's proposal as it  
23 relates to your division, water appropriations,  
24 your opinion isn't based on having looked at any  
25 kind of independent modeling with respect to the

Page 1382

1 City's proposal, correct?  
 2 **A. Correct.**  
 3 Q. Earlier, Mr. Oleen introduced Exhibit 1, DWR's  
 4 Exhibit 1, and in DWR's Exhibit 1, this concept  
 5 of a functional equivalent is identified. Would  
 6 you agree that the concept of a functional  
 7 equivalent is, in fact, addressed in that  
 8 letter?  
 9 **A. Yes.**  
 10 Q. Who first came up with the concept of a  
 11 functional equivalent?  
 12 **A. I -- I don't know which one of the team did.**  
 13 Q. I guess my question is did the idea of a  
 14 functional equivalent, did that terminology  
 15 originate with the Division of Water Resources,  
 16 or do you believe that it originated with the  
 17 City?  
 18 **A. I -- you know, it was all part of our**  
 19 **discussions; I don't know which side would have**  
 20 **come up with the functional equivalent.**  
 21 Q. Okay. And so if you -- if you're not aware of  
 22 which side came up with the concept of a  
 23 functional equivalent, then you certainly  
 24 wouldn't be able to mention the person that came  
 25 up with this concept; is that right?

Page 1383

1 **A. That's correct.**  
 2 Q. When the concept for functional equivalent was  
 3 developed, as those discussions occurred, who  
 4 was at the table, what parties were at the  
 5 table?  
 6 **A. Burns & McDonnell, Wichita, and the Division of**  
 7 **Water Resources.**  
 8 Q. Was the District part of those discussions?  
 9 **A. You know, I think they were early on, but then I**  
 10 **think there was some break -- there was some**  
 11 **breakdown, and then it just became the Division,**  
 12 **Wichita, and Burns & Mac.**  
 13 Q. As you're sitting here before us today, do you  
 14 know why at some point the District was excluded  
 15 from those discussions?  
 16 **A. I -- I cannot say other than Wichita and the**  
 17 **District couldn't agree, I believe is what**  
 18 **happened, but I don't know exactly when that**  
 19 **happened.**  
 20 Q. So basically just because the District expressed  
 21 some concerns, perhaps, with the modeling or  
 22 some concerns with, let's say, errors in the  
 23 proposal itself, just because the District  
 24 expressed some of those concerns, they were  
 25 excluded from the table and excluded from those

Page 1384

1 discussions, is that basically your  
 2 understanding?  
 3 **A. Well, I don't -- I think they were excluded from**  
 4 **the discussion to build a proposal, but then**  
 5 **they're all -- they're still part of the**  
 6 **process. I mean, they're part of this hearing,**  
 7 **and then after this hearing, if it moves**  
 8 **forward, it'll go to the board for a**  
 9 **recommendation.**  
 10 Q. But my question is back when the concept of a  
 11 functional equivalent was being discussed and  
 12 there was Burns & Mac, the Division of Water  
 13 Resources, and the City were all in a room, all  
 14 part of these discussions, the reason that was  
 15 identified for me for why the District would be  
 16 excluded was because the District had differing  
 17 viewpoints from the City of Wichita, is that --  
 18 was there another reason why --  
 19 **A. No.**  
 20 Q. -- they would have been excluded from those  
 21 discussions?  
 22 **A. I don't think so.**  
 23 Q. Okay. So that's, in your -- from your  
 24 standpoint, the primary or main reason why the  
 25 District, then, would have been excluded from

Page 1385

1 those discussions?  
 2 **A. It was a different viewpoint.**  
 3 Q. So the answer is yes?  
 4 **A. Yes. Yes.**  
 5 Q. Hindsight is always 20/20, but as you're sitting  
 6 here today, even though the District had a  
 7 differing opinion back at that time and as we've  
 8 identified errors in the City's proposal that  
 9 have come out for the first time during this  
 10 hearing process, do you believe that looking  
 11 back it would have been best to continue to  
 12 involve the District in those discussions?  
 13 **A. Yeah, I'm -- sure, if -- if folks could agree, I**  
 14 **think it would have been better.**  
 15 Q. But even if the District had differing  
 16 viewpoints, wouldn't it have been best if the  
 17 District could have raised those viewpoints back  
 18 in those early discussions?  
 19 **A. I -- I think the District did to the point that**  
 20 **the City of Wichita had become frustrated with**  
 21 **the District.**  
 22 Q. So it was -- so it wasn't the Division of Water  
 23 Resources that asked that the District be  
 24 excluded from the table, it was the City of  
 25 Wichita that asked that the District not be

1 included in those discussions. Is that a true  
2 statement?

3 **A. Actually, the -- yes, because the -- David**  
4 **Barfield asked the City and the District to meet**  
5 **and work out their differences. I think they**  
6 **met for a number of months, and they couldn't,**  
7 **they couldn't work them out.**

8 Q. But to the best of your knowledge, you're not  
9 aware of any time where the District said, we're  
10 not going to further meet with the City?

11 **A. That's correct.**

12 Q. So that to the extent the City -- the District  
13 was excluded from the discussions, that was a  
14 request made by the City; is that right?

15 **A. I believe so. It was -- it was more of just**  
16 **wanting to meet with Burns & Mac, Division, and**  
17 **the City.**

18 Q. Now, let's move back to Exhibit 1, which is  
19 where we first identify this functional  
20 equivalent concept. You -- Mr. Oleen asked you  
21 a few questions as far as why you believe that  
22 an AMC is a functional equivalent. Could you  
23 break down for me in a conceptual manner how a  
24 aquifer maintenance credit is a functional  
25 equivalent of actual physical recharge again?

1 **A. Yes. So the water has to be available from the**  
2 **Little Ark, and it is taken at the diversion**  
3 **point from the Little Ark, the authorized point**  
4 **of diversion from the Little Ark River; it's**  
5 **taken to the treatment facility, treated; then**  
6 **it leaves the treatment facility, and at that**  
7 **point a decision has to be made if there's room**  
8 **in the aquifer. And if there's room in the**  
9 **aquifer, then it becomes a physical recharge**  
10 **credit; if there's not room in the aquifer, then**  
11 **it's taken directly to the City but gets the**  
12 **aquifer maintenance credit at that point. It is**  
13 **not making the City pump a gallon just to**  
14 **replace it with a gallon. It's not taking the**  
15 **water through the aquifer to build the credit**  
16 **basically, it's taking it directly to town.**

17 Q. We'll discuss those concepts in great detail  
18 later, but at least for now, for our purposes  
19 now, who made the decision that the aquifer  
20 maintenance credit concept was consistent with  
21 current regulations and statutes, who made that  
22 final decision?

23 **A. Robert -- well, the chief legal counsel at the**  
24 **time that reviewed it, I believe, was Robert**  
25 **Large, and -- and I don't know if Kenny Titus**

1 **then came along later to tidy up, but it was**  
2 **Robert Large. But then it's ultimately the**  
3 **chief engineer's decision whether it meets the**  
4 **rules and regs.**

5 **We met -- we asked our legal counsel to**  
6 **review it, and I know the City asked their legal**  
7 **counsel to review it to see if we needed to make**  
8 **a regulation change. And after both sides**  
9 **reviewed it, we decided that it was just another**  
10 **type of recharge credit, so we didn't change the**  
11 **rules.**

12 Q. I would ask that you turn to Exhibit 11 again, I  
13 think it's already in front of you.

14 **A. Okay, I'm there.**

15 Q. With respect to Exhibit 11, could you turn to  
16 page 9 and there's an interrogatory on page 9 of  
17 that document? Interrogatory 19 on page 9, are  
18 you -- tell me when you're there,  
19 Mr. Letourneau.

20 **A. I'm there.**

21 Q. As you look at the response to interrogatory  
22 number 19, does that help to refresh your memory  
23 as far as, at least when you signed off on these  
24 interrogatories, who might have done a legal  
25 analysis of the City's proposal?

1 **A. Yes.**  
2 Q. Who were the individuals that were involved in  
3 that process?  
4 **A. Such legal reviews at varying degrees by chief**  
5 **legal counsel Robert Large and/or Wendee Grady,**  
6 **and by current KDHE counsel Kenneth Titus.**  
7 Q. And I believe also in that answer, the chief  
8 engineer's letters, and there's a couple letters  
9 that are referenced there also indicated in that  
10 answer?  
11 **A. That's correct.**  
12 Q. With regard to the regulations that were  
13 considered, three lines up from the bottom of  
14 that answer there's some regulations that were  
15 identified that the individuals that reviewed  
16 the City's proposal from a legality standpoint  
17 would have looked at. Can you tell me what  
18 those regulations are?  
19 **A. K.A.R. 5-1-1, 5-12-1 through 5-12-4.**  
20 Q. And it also says that -- it also states that  
21 there was other applicable GMD2 regulations and  
22 relevant statutory provisions of the Kansas  
23 Water Appropriation Act that were considered as  
24 well; is that right?  
25 **A. That's correct.**

1 **A. Yes.**  
2 Q. Who were the individuals that were involved in  
3 that process?  
4 **A. Such legal reviews at varying degrees by chief**  
5 **legal counsel Robert Large and/or Wendee Grady,**  
6 **and by current KDHE counsel Kenneth Titus.**  
7 Q. And I believe also in that answer, the chief  
8 engineer's letters, and there's a couple letters  
9 that are referenced there also indicated in that  
10 answer?  
11 **A. That's correct.**  
12 Q. With regard to the regulations that were  
13 considered, three lines up from the bottom of  
14 that answer there's some regulations that were  
15 identified that the individuals that reviewed  
16 the City's proposal from a legality standpoint  
17 would have looked at. Can you tell me what  
18 those regulations are?  
19 **A. K.A.R. 5-1-1, 5-12-1 through 5-12-4.**  
20 Q. And it also says that -- it also states that  
21 there was other applicable GMD2 regulations and  
22 relevant statutory provisions of the Kansas  
23 Water Appropriation Act that were considered as  
24 well; is that right?  
25 **A. That's correct.**

7 Q. And I believe also in that answer, the chief  
8 engineer's letters, and there's a couple letters  
9 that are referenced there also indicated in that  
10 answer?  
11 **A. That's correct.**  
12 Q. With regard to the regulations that were  
13 considered, three lines up from the bottom of  
14 that answer there's some regulations that were  
15 identified that the individuals that reviewed  
16 the City's proposal from a legality standpoint  
17 would have looked at. Can you tell me what  
18 those regulations are?  
19 **A. K.A.R. 5-1-1, 5-12-1 through 5-12-4.**  
20 Q. And it also says that -- it also states that  
21 there was other applicable GMD2 regulations and  
22 relevant statutory provisions of the Kansas  
23 Water Appropriation Act that were considered as  
24 well; is that right?  
25 **A. That's correct.**

11 **A. That's correct.**

12 Q. With regard to the regulations that were  
13 considered, three lines up from the bottom of  
14 that answer there's some regulations that were  
15 identified that the individuals that reviewed  
16 the City's proposal from a legality standpoint  
17 would have looked at. Can you tell me what  
18 those regulations are?  
19 **A. K.A.R. 5-1-1, 5-12-1 through 5-12-4.**  
20 Q. And it also says that -- it also states that  
21 there was other applicable GMD2 regulations and  
22 relevant statutory provisions of the Kansas  
23 Water Appropriation Act that were considered as  
24 well; is that right?  
25 **A. That's correct.**

19 **A. K.A.R. 5-1-1, 5-12-1 through 5-12-4.**

20 Q. And it also says that -- it also states that  
21 there was other applicable GMD2 regulations and  
22 relevant statutory provisions of the Kansas  
23 Water Appropriation Act that were considered as  
24 well; is that right?  
25 **A. That's correct.**

25 **A. That's correct.**

Page 1390

1 Q. Off the top of your head, do you know any other  
 2 specific regulations or statutes that would have  
 3 been considered as part of those discussions?  
 4 **A. Not off the top of my head.**  
 5 Q. Is there anyone in the room today that would be  
 6 able to answer what additional statutes and  
 7 regulations would have entered into those  
 8 discussions?  
 9 **A. Not that I'm aware of.**  
 10 Q. Tell me just a little bit about the  
 11 conversations that you personally had with the  
 12 City regarding the aquifer maintenance credit  
 13 proposal. Tell me, first of all, when you first  
 14 started having discussions with the City in that  
 15 regard. I think you testified that it was  
 16 approximately two years, one or two years before  
 17 the proposal was submitted?  
 18 **A. Probably.**  
 19 Q. How many conversations would you say that you've  
 20 had with the City about the proposal since?  
 21 **A. I'm -- about this proposal in front of us or how**  
 22 **many meetings did we have or what ...**  
 23 Q. My question is do you know how many meetings or  
 24 discussions you would have had with the City  
 25 about the proposal?

Page 1391

1 **A. No, I can't put a number to it.**  
 2 Q. Was there any document that you're aware of that  
 3 was introduced in discovery or otherwise that  
 4 would help to elucidate how many meetings  
 5 occurred?  
 6 **A. There might be, yeah. If you're aware of some,**  
 7 **I'd look at them.**  
 8 Q. But at least as you're sitting here today,  
 9 you're not aware of a specific document that  
 10 would help to refresh your memory in that  
 11 regard?  
 12 **A. No.**  
 13 Q. Do you know when you first would have had  
 14 conversations with consultants from the City?  
 15 Would your answer be the same as far as when you  
 16 first had discussions with the City itself?  
 17 **A. We had discussions, but I can't -- I can't tell**  
 18 **you when they started. So the answer is the**  
 19 **same.**  
 20 Q. Probably about a year or two before the proposal  
 21 was submitted?  
 22 **A. Probably.**  
 23 Q. And same question, do you have any way to tell  
 24 me how many times you met with the City's  
 25 consultants or when those meetings would have

Page 1392

1 occurred?  
 2 **A. You know, we provided all of our calendars to**  
 3 **you, but that's as much as I could help provide**  
 4 **to you. I mean, I think there were probably**  
 5 **agendas to those meetings and our calendars, but**  
 6 **that's as much as -- I can't tell you off the**  
 7 **top of my head.**  
 8 Q. And for time purposes, I'm not going to pull  
 9 those up right now. But if the City were to  
 10 include some calendars that -- in some of their  
 11 notebooks that reference when some of these  
 12 meetings would occur and there would be minutes  
 13 of some of those meetings, would that help to  
 14 identify when those meetings occurred?  
 15 **A. Yes, absolutely.**  
 16 Q. With respect to the chief engineer, Mr. Oleen  
 17 has highlighted a letter that was written by the  
 18 chief engineer basically indicating that the  
 19 chief engineer supported the City's proposal.  
 20 Are you aware of the letter I'm speaking of?  
 21 **A. It was either the September 18th or June 17th**  
 22 **letter.**  
 23 Q. And, in fact, there were multiple letters where  
 24 the chief engineer expressed his support of the  
 25 City's proposal; is that correct?

Page 1393

1 **A. That's correct.**  
 2 Q. So as early as 2017, at least, was the chief  
 3 engineer, Mr. Barfield, expressing support for  
 4 the City's proposal?  
 5 **A. Yes.**  
 6 Q. And was this support given not just through  
 7 letters but also in the form of public  
 8 discussions and public meetings?  
 9 **A. Yes, the one public meeting in Halstead.**  
 10 Q. And I believe that you indicated in your  
 11 deposition testimony that the chief engineer,  
 12 Mr. Barfield, was heavily involved in all these  
 13 discussions that occurred regarding the City's  
 14 proposal and the City's modeling. Is that a  
 15 true statement?  
 16 **A. That's a true statement, he was involved with**  
 17 **every meeting except for the monthly status**  
 18 **meetings that Susan Metzger and I would have.**  
 19 Q. Is it true that it was in 2017 that the City and  
 20 the Division of Water Resources first  
 21 acknowledged there was a need for the aquifer  
 22 maintenance credits?  
 23 **A. Yeah, the one in -- that one letter, yes.**  
 24 Q. So at least as early as 2017, Mr. Barfield had  
 25 already opined or recognized the fact in his

1 mind that an aquifer maintenance credit was a  
2 functional equivalent of a physical recharge  
3 credit. Is that a true statement?

4 **A. Yes, that's a true statement, but he did want  
5 this hearing process to play out also.**

6 Q. Has the chief engineer, or any staff member for  
7 the Division of Water Resources for that matter,  
8 ever applied the concept of a functional  
9 equivalent in any other context?

10 **A. Not -- nothing comes to mind.**

11 Q. In other words, an example would be an irrigator  
12 comes before your department and has a new  
13 application, and the irrigator says, you know  
14 what, this application seems really, really  
15 close to what you've approved in the past, and  
16 I'll acknowledge it's just a little different  
17 but it's really close to what you've approved in  
18 the past, have you ever said with respect to an  
19 irrigator, or another applicant for that matter,  
20 that, yes, this is a functional equivalent and  
21 we're going to go ahead and approve it?

22 **A. No, but there aren't near the specifics that are  
23 in -- in that example that we have in our  
24 proposal.**

25 Q. And I understand that you're drawing a

1 **PRESIDING OFFICER:** Well, they've  
2 already been administratively noticed. Do  
3 you have a comment, Mr. Oleen?

4 **MR. OLEEN:** Just I think related to  
5 my first comment when the, maybe it was the  
6 Kansas Water Appropriation Act, a copy was  
7 offered and admitted. I don't know that  
8 these are current, updated versions, so  
9 long as no one is being bound to the laws  
10 that are copied here. They're probably  
11 correct, updated copies, but I don't know,  
12 as long as they're -- subject to that  
13 qualification, I have no objection.

14 **MR. MCLEOD:** Madam Hearing Officer,  
15 I -- I let this go the last time it was  
16 done, but it is absolutely bizarre to put  
17 laws and regulations en masse into the  
18 hearing record as exhibits. They're the  
19 laws and regulations, they've been  
20 judicially noticed, and the only  
21 conceivable purpose is to make the hearing  
22 transcript exponentially more expensive,  
23 and I object for that reason.

24 **PRESIDING OFFICER:** Any other  
25 comments?

1 distinction here, but at least as it relates to  
2 any other applicant other than the City of  
3 Wichita, you've never attempted to apply this  
4 functional equivalent concept to any other  
5 applicant; is that true?

6 **A. That's true.**

7 Q. In front of you in your exhibit notebook, which  
8 is Volume II, I will proffer for you that  
9 Exhibit 21 is the Kansas Water Appropriation  
10 Act, Exhibit 22 is the rules and regulations  
11 with regard to the Kansas Water Appropriation  
12 Act, Exhibit 23 is the Kansas Groundwater  
13 Management District's Act, K.S.A. 82a-1020,  
14 et seq., Exhibit 24 are the rules and  
15 regulations adopted with respect to GMD District  
16 No. 2. If you were to flip through those four  
17 exhibits for me, would you roughly flip through  
18 those four exhibits and see if you agree with my  
19 characterization of what those exhibits are?

20 **A. Yes, that's what they are.**

21 **MR. STUCKY:** From a house -- a  
22 housekeeping standpoint, I'd ask to move to  
23 admit those four exhibits into evidence. I  
24 know one of them has already been admitted,  
25 I'd ask to admit all four of them.

1 **MR. STUCKY:** I guess my comment is  
2 that with regard to the prior hearing, all  
3 the exhibits were scanned by the court  
4 reporter, including these particular  
5 exhibits, they've already been scanned,  
6 every one of them was scanned by the prior  
7 court reporter, and, in fact, we were all  
8 assessed charges for those exhibits being  
9 scanned. She indicated that she was going  
10 to scan the exhibits in advance.

11 And so from that standpoint, it's my  
12 viewpoint that we've already been charged  
13 for the scanning of those exhibits. And  
14 when you look at the cost of a transcript,  
15 merely scanning an exhibit is a minor cost  
16 compared to the cost of creating a record  
17 and typing up objections and things of that  
18 nature.

19 **PRESIDING OFFICER:** Mr. Oleen?

20 **MR. OLEEN:** Yes, Madam Hearing  
21 Officer, I have some particular insight on  
22 that because I recently had to deal with  
23 the former stenographer about obtaining the  
24 originals. I was told that while all of  
25 the Groundwater Management District No. 2's

Page 1398

1 volumes have been scanned, I was told we  
 2 were not charged for the exhibits that have  
 3 not yet been admitted.  
 4 I was told that it would be an  
 5 additional \$995 to get the scanned copies  
 6 of the anticipated exhibits that the GMD  
 7 wants to offer. If the GMD wants to pay  
 8 that \$995, then fine, but I -- we have not  
 9 been assessed charges for the scanned but  
 10 not yet admitted exhibits as I was told and  
 11 have in some correspondence somewhere.  
 12 **PRESIDING OFFICER:** Okay. By virtue  
 13 of the fact that these have been  
 14 administratively, judicially noticed, I  
 15 don't think they need to be admitted  
 16 exhibits. So if you are using them today  
 17 for points of reference, I think that's  
 18 fine, but I don't think they need to be  
 19 formally admitted as exhibits, they're  
 20 already going to apply to this case. So to  
 21 that extent, then, I'm just going to say  
 22 21, 22, and 23 and 24 do not need to be  
 23 admitted, they already apply, they're  
 24 already noticed. So please proceed.  
 25 **MR. STUCKY:** At least for the record

Page 1399

1 purposes, is it okay if I still refer to  
 2 them as exhibits numerically to make it  
 3 easy for our discussion?  
 4 **PRESIDING OFFICER:** Yes, you've  
 5 identified what they are on the record so  
 6 that's fine.  
 7 **MR. STUCKY:** And other than that, I  
 8 know they've been judicially noticed, so I  
 9 don't care particularly if they're admitted  
 10 into evidence.  
 11 **BY MR. STUCKY:**  
 12 Q. Having looked at Exhibits 21 through 24, have  
 13 you had a chance to familiarize yourself with  
 14 those statutes and regulations?  
 15 **A. I know -- yes, I know what they are.**  
 16 Q. Could you show me in those statutes and  
 17 regulations where the concept of functional  
 18 equivalent is first found in statute or  
 19 regulation?  
 20 **MR. OLEEN:** I'm going to object, I  
 21 know that it's -- it's Mr. Letourneau's,  
 22 part of his job to apply laws, but -- and  
 23 perhaps I should have objected sooner, but  
 24 Mr. Stucky is oftentimes coming close to  
 25 asking Mr. Letourneau about legal

Page 1400

1 conclusions, about which he is not  
 2 qualified to opine. And I think this  
 3 question is perhaps closest to that. I  
 4 know Mr. Stucky, or his client rather,  
 5 disagrees with certain characterizations of  
 6 the laws; that's something that's more  
 7 appropriate for a legal brief, I don't  
 8 think that's appropriate for this witness's  
 9 opinion testimony.  
 10 **PRESIDING OFFICER:** You've asked  
 11 if -- asked Mr. Letourneau if any approvals  
 12 have ever been issued before based on a  
 13 functional equivalent concept, he has said  
 14 no. Because it is the purview of his job  
 15 and career to apply the regs and the laws,  
 16 I think it's fair to ask him if he has  
 17 applied anything in these documents --  
 18 well, never mind. I don't think it gets in  
 19 the realm of a legal conclusion to ask --  
 20 well, it's getting close to 5:00. Yeah.  
 21 **MR. STUCKY:** I can rephrase my  
 22 question.  
 23 **PRESIDING OFFICER:** If you would,  
 24 please.  
 25 **BY MR. STUCKY:**

Page 1401

1 Q. Based on your 33 years of experience of applying  
 2 statutes and regulations to applications and  
 3 water rights, have you ever seen the  
 4 terminology, functional equivalent, in a statute  
 5 or regulation, to your knowledge?  
 6 **A. No.**  
 7 Q. And, in fact, if I were to ask you to flip  
 8 through all these statutes and regulations,  
 9 would you be able to point me to a place where  
 10 that terminology is mentioned?  
 11 **A. No.**  
 12 **MR. STUCKY:** Would you like me to  
 13 quit for the day, Madam Hearing Officer?  
 14 Was that a suggestion?  
 15 **PRESIDING OFFICER:** No, I didn't  
 16 mean to undermine your case at all. Are  
 17 you about to lead into a new line of  
 18 questioning, do you -- is this a good  
 19 stopping point? You need to tell me.  
 20 **MR. STUCKY:** I have a fair number of  
 21 more questions regarding this line of  
 22 questioning. I guess I can continue till  
 23 5:00 o'clock, and we can see where we end  
 24 up.  
 25 **PRESIDING OFFICER:** Yeah, it's ten

1 more minutes, let's do that.  
2 **BY MR. STUCKY:**  
3 Q. So would you at least agree with me that when  
4 the chief engineer wrote letters touting this  
5 concept of a functional equivalent, the chief  
6 engineer did not cite any statutory authority  
7 that specifically mentions the terminology  
8 functional equivalent, would you agree with  
9 that?  
10 **A. I would agree.**  
11 Q. And I think you already said that the chief  
12 engineer opined that the City's proposal was in  
13 the public interest, at least prior to this  
14 hearing occurring. Is that a true statement?  
15 **A. Correct.**  
16 Q. And I think that you said that part of the  
17 reason why it was in the public interest, and  
18 both Mr. Oleen and Mr. McLeod helped to  
19 illuminate this point, but your opinion was that  
20 Mr. Barfield believed it was in the public  
21 interest because it would have kept the aquifer  
22 full more of the time. Is that -- was that the  
23 testimony?  
24 **A. That's correct.**  
25 Q. Other than the City's desire or stated purpose

1 of keeping the aquifer full more of the time,  
2 are you aware of other ways that the City's  
3 proposal would be in the public interest?  
4 **A. Well, it's in -- well, no, it's in the public  
5 interest to manage the groundwater full, to  
6 manage the aquifer full.**  
7 Q. At least with regard to the letters that were  
8 written by the chief engineer, Mr. Barfield, or  
9 based on statements that Mr. Barfield made, did  
10 he identify any other ways in which the City's  
11 proposal was in the public interest?  
12 **A. I'd have to review the letters.**  
13 Q. I'll give you a moment to do so.  
14 **A. Okay. Yeah, looking really quickly at them,  
15 nothing sticks out at me, but it's -- it's  
16 managing the aquifer full is what we feel is in  
17 the public interest. Having a full aquifer  
18 moving into a 1 percent drought.**  
19 Q. So, for example, in the first letter, it states  
20 that AMCs should serve the public interest by  
21 facilitating fuller aquifer conditions, in the  
22 third paragraph, for example?  
23 **A. That -- that's there, yes.**  
24 Q. And if you were to review those letters, the  
25 reason that the City's proposal is touted as

1 benefitting the aquifer and being in the public  
2 interest is because it keeps the aquifer fuller;  
3 is that true?  
4 **A. That's true.**  
5 Q. And, in fact, those letters don't specifically  
6 identify any other reason why the City's  
7 proposal is in the public interest. Would that  
8 also be true?  
9 **A. That -- yes.**  
10 Q. Aside from those letters that have been  
11 introduced into evidence by Mr. Oleen, are you  
12 aware of anything else that Mr. Barfield would  
13 have stated with regard to how the City's  
14 proposal was in the public interest, or was it  
15 only the fact that it kept the aquifer levels  
16 full?  
17 **A. Only the aquifer levels full that I'm aware of.**  
18 Q. And just so I'm clear on what we're talking  
19 about with respect to keeping the aquifer levels  
20 full, what we're talking about is the fact that  
21 the aquifer could be kept full while the City  
22 accumulated an aquifer maintenance credit; is  
23 that correct?  
24 **A. That's correct.**  
25 Q. As you're sitting here today, are you aware of

1 conversations you would have had with any other  
2 employee of the Division of Water Resources  
3 where they would have expressed another way in  
4 which the City's proposal is in the public  
5 interest?  
6 **A. I -- maybe, I can't think of one off the top of  
7 my head.**  
8 Q. Well, off the top of your head, either based on  
9 what's been expressed to you by another employee  
10 of the Division of Water Resources or based on  
11 your own knowledge, are you aware of a way that  
12 the City -- City's proposal is in the public  
13 interest other than keeping the aquifer full  
14 while the AMCs are accumulated?  
15 **A. No.**  
16 Q. Would you also agree with me that the Division  
17 of Water Resources did not analyze any  
18 individual well logs as it relates to the City's  
19 proposal?  
20 **A. That's true.**  
21 Q. Would you also agree that the Division of Water  
22 Resources never performed any well testing to  
23 try and help verify the City's proposal?  
24 **A. That's true.**  
25 Q. And there were so many objections that I'm not

1 sure I asked this or not, but you would also  
 2 agree that the Division of Water Resources did  
 3 not conduct any kind of independent modeling or  
 4 measurements with regard to the City's proposal?  
 5 **A. I can't -- I can't state independent modeling,**  
 6 **I'm not sure, but I don't -- but we did not do**  
 7 **any measurements.**  
 8 Q. But with respect to independent modeling, I  
 9 think you read an answer to one of your  
 10 interrogatories, and I can pull it back up, but  
 11 wasn't your testimony that there was no  
 12 independent modeling that was performed by the  
 13 Division of Water Resources?  
 14 **A. That's my understanding, but I'm -- I don't know**  
 15 **exactly what the team did when they reviewed it.**  
 16 Q. Did you personally review any literature to help  
 17 you understand the City's proposal?  
 18 **A. No, not other than the proposal.**  
 19 Q. So your opinions today are based on having read  
 20 the proposal itself?  
 21 **A. Yes, and that -- the table that showed the**  
 22 **proposal and then the maps that showed the**  
 23 **result.**  
 24 **MR. STUCKY:** I'm ready to shift to a  
 25 new line of questioning. I notice that

1 it's one minute till 5:00, would you like  
 2 me to proceed, or is this a good stopping  
 3 point?  
 4 **PRESIDING OFFICER:** This is a good  
 5 stopping point. It's 5:00 o'clock now, we  
 6 will recess until 9:00 o'clock tomorrow  
 7 morning.  
 8 (Whereupon, the proceedings were  
 9 adjourned at 5:00 p.m.)

**PRESIDING OFFICER:** Okay. We're back on the record. It is 9:00 a.m. on February 12, 2020, and we are still at the First Mennonite Church in Halstead, Kansas, continuing the hearing for City of Wichita's request to modify their ASR Phase II project. And I believe we were having cross-examination of Mr. Letourneau by Mr. Stucky.

**CROSS-EXAMINATION (Cont.)  
BY MR. STUCKY:**

Q. Mr. Letourneau, yesterday we had a discussion about multi-year flex accounts. Is there -- was there a recent study completed by the Division of Water Resources with respect to multi-year flex accounts and their effects on water usage?

**A. Yes. As a matter of fact, each year we're required by the legislature to provide an annual report on the multi-year flex accounts. And so the chief engineer, he actually asked Sam Perkins and others to look at the water use before multi-year flex accounts and after multi-year flex accounts. And, actually, it's not published yet, but it's good data. We found**

1 **out that really it's -- the net effect is the**  
2 **same on -- in a multi-year flex account or out**  
3 **of a multi-year flex account, we found that the**  
4 **net effect is the same.**

5 Q. So in other words, during at least the five-year  
6 window when a multi-year flex account is in  
7 place versus the five-year window when a  
8 multi-year flex account is not in effect, the  
9 water usage during that five-year window was the  
10 same, is that what you found?

11 **A. That's correct. And these are all irrigation**  
12 **rights that are in a multi-year flex account.**

13 Q. Yesterday I also asked you about K.A.R.  
14 5-22-14(f) and the 20-year window for municipal  
15 planning. Do you recall that?

16 **A. Yes.**

17 Q. We discussed the fact that in an appropriation  
18 application for municipal use, the projected  
19 water use demand can be based on a maximum  
20 20-year projection window, and we contrasted  
21 that regulation to the 40 years of water demand  
22 projection that the City brought before us  
23 today. Do you recall that?

24 **A. Yes.**

25 Q. When I asked you to explain how the City could

1 Q. So if we mention cities such as Olathe and  
2 Manhattan, just so we have a clear record, we're  
3 comparing apples and oranges in the sense that  
4 they're not part of the Equus Beds Groundwater  
5 Management District, correct?

6 **A. They're not located within the Groundwater**  
7 **Management District, but they're still a large**  
8 **municipality.**

9 Q. But not subject to the regulation we just talked  
10 about, correct?

11 **A. That's correct.**

12 Q. Additionally, are you aware of the situation  
13 with respect to the City of Maize where they  
14 asked to project out further than 20 years and  
15 it was denied both by the GMD2 and by the  
16 Division of Water Resources?

17 **A. Yes, I do recall Maize, we -- we went with the**  
18 **GMD's recommendation. When I say we, Division**  
19 **of Water Resources accepted the GMD's**  
20 **recommendation.**

21 Q. So with respect to the Chinese wall that  
22 Mr. Oleen asked you about yesterday, first of  
23 all, how were the decisions made as far as who  
24 would be on a given team and who wouldn't be on  
25 a given team?

1 now plan for 40 years, you indicated that after  
2 the first 20 years, the City could extend its  
3 perfection period by another 20 years. Do you  
4 recall that?

5 **A. Yes, absolutely.**

6 Q. However, just to clarify, while the perfection  
7 period may be extended to allow a city to meet  
8 the initial projected demands, a city is not  
9 allowed to ask for additional water after the  
10 first 20 years have past and change the initial  
11 projections, correct?

12 **A. That's correct.**

13 Q. When Mr. --

14 **A. You know, you had asked me yesterday about how**  
15 **many cities do a projection, and if appropriate,**  
16 **Doug Schemm reminded me, who works new**  
17 **applications, we've had Olathe, WaterOne,**  
18 **Manhattan, a number of larger municipalities ask**  
19 **for -- they do a 40-year projection when they do**  
20 **their new applications. And I didn't know that**  
21 **yesterday, but I know that now.**

22 Q. And just to clarify the record, K.A.R. -- the  
23 K.A.R. I just cited is part of the GMD2  
24 regulations, correct?

25 **A. Absolutely.**

1 **A. I'd have to say David Barfield and Kenny Titus,**  
2 **chief engineer and chief legal counsel, were the**  
3 **ones that established the teams.**

4 Q. And is it similar to picking teams in sports,  
5 Mr. Barfield was able to kind of have a lottery  
6 of who he wanted on his team and then  
7 essentially pick some people for another team,  
8 or was there a more involved process to decide  
9 who was on which team?

10 **A. Well, I think it actually had to do with our**  
11 **technical roles in this is what David looked at.**

12 Q. And explain what you mean by looking at  
13 technical roles.

14 **A. Well, David felt appropriate to -- this is what**  
15 **I think, that David felt appropriate to keep the**  
16 **modelers on his team for reviewing any type of**  
17 **technical modeling questions.**

18 Q. And so after this Chinese wall was created, all  
19 the modelers that worked for DWR were  
20 essentially on Mr. Barfield's team?

21 **A. All but Ginger Pugh and Ginger Pugh is on our**  
22 **team. But Ginger came in late -- early in her**  
23 **career but late in our process, if that makes**  
24 **sense. She doesn't have a lot of experience**  
25 **with this particular project.**

Page 1417

1 Q. So in other words, as Mr. Barfield picked the  
 2 teams, he took the modelers that were involved  
 3 in the process from the beginning and the  
 4 experienced modelers and left you with the  
 5 modeler that had less experience with the  
 6 modeling?  
 7 **A. That's correct.**  
 8 Q. And so after that decision was made, does it  
 9 suffice to say that at least the number of  
 10 modelers that you had and the experience of  
 11 those modelers was limited after that decision  
 12 was made? From your standpoint?  
 13 **A. Yes, but the modeling, I mean, as far as my**  
 14 **program, the modeling was accepted by that team,**  
 15 **therefore accepted by our program, I mean, as**  
 16 **laid out in the chief engineer's letters.**  
 17 Q. And I guess I'm also maybe not clear how that  
 18 works, so the way this can work is if a given  
 19 modeling team accepts a model right before this  
 20 Chinese wall is created, they can quick submit  
 21 their thoughts to the other team, and then after  
 22 that, they don't communicate anymore, is that  
 23 how it works?  
 24 **A. We didn't communicate after the wall was built.**  
 25 **We haven't communicated at all.**

Page 1418

1 Q. I guess what I'm trying to understand is the  
 2 modelers who at least gave some input on the  
 3 City's modeling and proposal, after the Chinese  
 4 wall was developed, you didn't have any further  
 5 conversation with them about the model?  
 6 **A. No. No.**  
 7 Q. And, in fact, to the extent that they would have  
 8 done further work on the model after this  
 9 Chinese wall of sorts was created, you wouldn't  
 10 know if they did further work, right?  
 11 **A. No, we don't talk about it at all.**  
 12 Q. Before the Chinese wall was created and the  
 13 discussions were occurring collectively, was --  
 14 were the consultants for the City part of a  
 15 collective group with DWR that was discussing  
 16 the proposal? I think you said yesterday that  
 17 the answer was yes?  
 18 **A. Yes.**  
 19 Q. After the Chinese wall was created, and I'm  
 20 going to refer to two teams.  
 21 **A. Yes.**  
 22 Q. I'm going to refer to Mr. Letourneau's team and  
 23 Mr. Barfield's team, if you will, just for  
 24 simplicity.  
 25 **A. Sure.**

Page 1419

1 Q. After the Chinese wall was created, were the  
 2 City's consultants still conversing with  
 3 Mr. Letourneau's team?  
 4 **A. Yes.**  
 5 Q. After the Chinese wall was created, were the  
 6 City's consultants still communicating with  
 7 Mr. Barfield's team?  
 8 **A. No. I mean, they're not supposed to be.**  
 9 **Dave -- the chief engineer's team is Chinese**  
 10 **walled off from everyone at this point.**  
 11 Q. Same question with respect to the City of  
 12 Wichita, after this Chinese wall was created,  
 13 was the City of Wichita communicating with  
 14 Mr. Letourneau's team?  
 15 **A. Yes.**  
 16 Q. After this Chinese wall was created, was the  
 17 City of Wichita communicating with  
 18 Mr. Barfield's team?  
 19 **A. They shouldn't have been. I mean, but**  
 20 **Barfield's team is not communicating to me at**  
 21 **all, so I don't know what communications they've**  
 22 **had, but they're not supposed to be.**  
 23 Q. And I guess I want to just understand a little  
 24 bit better internally from an agency perspective  
 25 how this Chinese wall works. So, for example,

Page 1420

1 let's say that you're headed to the restroom in  
 2 the DWR offices and you meet up with  
 3 Mr. Barfield in the restroom, could you say to  
 4 him, that Mr. Stucky sure is getting on my  
 5 nerves with respect to this DWR project with the  
 6 City of Wichita, is that a conversation you  
 7 could have?  
 8 **A. No.**  
 9 **MR. OLEEN:** I object to --  
 10 **A. No.**  
 11 **MR. OLEEN:** I object --  
 12 **A. Okay.**  
 13 **MR. OLEEN:** -- to this line of  
 14 questioning because I think this goes  
 15 really to the previous motion that GMD2  
 16 filed to try to disqualify any DWR  
 17 testimony on the basis of some sort of  
 18 impropriety and connection with the chief  
 19 engineer. We've had this discussion about  
 20 the fact that there were these Chinese  
 21 walls and DWR didn't violate that and they  
 22 tried to claim that DWR had and, therefore,  
 23 this whole process was tainted. I -- I  
 24 don't think this is a good usage of our  
 25 time with this line of questioning.

1 **PRESIDING OFFICER:** Mr. Stucky.  
2 **MR. STUCKY:** Madam Hearing Officer,  
3 in his direct examination, Mr. Oleen asked  
4 about the Chinese wall. If he hadn't asked  
5 about this Chinese wall in his direct  
6 examination and it wasn't part of the  
7 deposition transcript at all, I would maybe  
8 concede that this line of questioning is  
9 outside the scope of this hearing, but  
10 Mr. Oleen specifically talked about the  
11 Chinese wall and elaborated on it in his  
12 direct examination.  
13 **PRESIDING OFFICER:** I think in lieu  
14 of the fact that you asked about it, plus  
15 even though I believe I understand the  
16 landscape of what is being called a Chinese  
17 wall, future entities after me that may be  
18 reviewing this record may not understand as  
19 clearly, so it may be helpful to have this  
20 explained in the record. So I'm curious to  
21 see where you're going with this, but for  
22 now we'll let it go.  
23 **BY MR. STUCKY:**  
24 Q. Just a moment ago, I asked you about the extent  
25 to which you could communicate about the ASR or

Page 1422

1 the AMC project with the chief engineer and his  
2 team. And my question was whether or not you  
3 could even joke about it on a surface level or  
4 talk about it in any fashion?  
5 **A. We -- we don't. And to give you an example, I**  
6 **was in Topeka in same -- sharing a same**  
7 **multi-desk office with Kenny Titus, and Aaron**  
8 **needed to call me to talk about this hearing,**  
9 **and I had to put off that phone call because**  
10 **Kenny's in there. Now, Kenny would only hear**  
11 **one half of the conversation, but that is one**  
12 **thing that we are, I have to say, are very**  
13 **respectful of and very good about is we --**  
14 **that's one thing that we never want to mess up**  
15 **one of these hearings by goofing up and talking**  
16 **about the Chinese wall, we don't joke about the**  
17 **Chinese wall, so we respect that fully.**  
18 Q. But also are you -- is your testimony that you  
19 wouldn't talk about the subject matter of this  
20 hearing between the teams at all?  
21 **A. No, we -- we don't, we don't even talk about ASR**  
22 **other than we're going to an ASR hearing.**  
23 **That's as far as we take it.**  
24 Q. After the decision was made to appoint Ms. Owen  
25 as the new hearing officer, at that point, is

1 that when the Chinese wall was created? I was  
2 unclear with the timeline.  
3 **A. No, it was created right after the public**  
4 **hearing in Halstead -- the public meeting, I'm**  
5 **sorry. There was a public meeting in Halstead,**  
6 **and at that time, I believe, is when the Chinese**  
7 **wall was created. And then after -- and then to**  
8 **go on, when Ms. Owen was appointed the hearing**  
9 **officer, Kenny Titus, then, said, the Chinese**  
10 **wall is still there, we still can't talk about**  
11 **this thing.**  
12 Q. So in other words, before the decision was made  
13 to appoint a new hearing officer, the Chinese  
14 wall was already being put into effect?  
15 **A. Yes. Yes. Now, I have to be honest, in the**  
16 **very beginning when the Chinese wall was put in**  
17 **effect, if somebody tried to say something to**  
18 **one another, we would remind ourselves that**  
19 **there is a Chinese wall. So there could have**  
20 **been a day or so before it became fully**  
21 **implemented, but there would be no -- nothing**  
22 **talked about, you know. Something start -- if**  
23 **one of us started to say something, the other**  
24 **one would say, there's a Chinese wall so ...**  
25 Q. Yesterday there was some questions asked about

Page 1424

1 errors in the City's model and also in previous  
2 days, and you've been sitting through this  
3 hearing and listening to those questions,  
4 correct?  
5 **A. Correct.**  
6 Q. And for everybody's benefit, I'm not going to go  
7 through those errors in any kind of detail  
8 again, but just would it suffice to say that you  
9 heard the 110 percent error with respect to  
10 Cheney?  
11 **A. Yes.**  
12 Q. And that was an error in table 2-3?  
13 **A. Correct.**  
14 Q. And there was also some errors that we discussed  
15 in table 2-5, correct?  
16 **A. Correct.**  
17 Q. And there was also some errors that we discussed  
18 in table 2-10, correct?  
19 **A. Correct.**  
20 Q. And in addition, when Mr. McCormick was  
21 testifying, he indicated that there was an error  
22 with respect to the 85 percent versus the 73  
23 percent and what now is closer to 64 percent.  
24 Do you recall that discussion as well?  
25 **A. That's correct.**

Page 1425

1 Q. When you were in college, did you have the  
 2 occasion to take any statistics courses?  
 3 **A. I did not.**  
 4 Q. So if I were to ask you from a statistical  
 5 standpoint what the concept of reliability and  
 6 validity are with respect to statistics, would  
 7 you have an answer to that?  
 8 **A. No, I would not.**  
 9 Q. However, yesterday you indicated that -- a term  
 10 of art that you used yesterday was the term  
 11 reasonable, that things seemed reasonable, you  
 12 used that terminology yesterday; is that -- is  
 13 that correct?  
 14 **A. That's correct.**  
 15 Q. As you listened to the discussion unfold and we  
 16 caught a number of errors and they unfolded in  
 17 real time in the hearing, did that cause you any  
 18 concern as you were sitting back and listening?  
 19 **A. Not the typographical errors, no, we -- and**  
 20 **we'll look at the magnitude of the errors to see**  
 21 **if the percentages change the overall outcome**  
 22 **very much, but we -- by the end of this process,**  
 23 **I mean, I appreciate the fact we've gone**  
 24 **through, we've identified the errors, we will**  
 25 **have a corrected -- a corrected proposal; it**

Page 1426

1 **won't be a brand-new proposal but a corrected**  
 2 **one as a result of this process.**  
 3 Q. So in other words, would it have mattered how  
 4 many errors were discovered in the proposal,  
 5 would you have still found that the proposal  
 6 seemed reasonable?  
 7 **A. I don't know until we -- until the corrections**  
 8 **happen and we let our team look at it, then**  
 9 **we'll be -- some of the errors didn't seem that,**  
 10 **you know, that gross, I'll say, but I don't**  
 11 **think that overall it's going to change the**  
 12 **proposal that much.**  
 13 Q. I used the -- I think I said great concern a  
 14 moment ago. Would you agree that each time you  
 15 look at a data set or a model and you discover  
 16 an error that it, at least, would cause you some  
 17 concern?  
 18 **A. Oh, yeah, sure, you'd want to look at it,**  
 19 **definitely.**  
 20 Q. So by changing my terminology and not putting  
 21 words in your mouth with respect to great  
 22 concern, would you at least agree with me that  
 23 as these errors unfolded in real time, it caused  
 24 you some concern?  
 25 **A. Yes, I mean, to where we definitely want to**

Page 1427

1 **review it.**  
 2 Q. I think in front of you there's a black notebook  
 3 that has the City's proposal in it.  
 4 **MR. STUCKY:** May I approach the  
 5 witness?  
 6 **PRESIDING OFFICER:** Yes.  
 7 **BY MR. STUCKY:**  
 8 Q. Mr. Letourneau, you have before you what was  
 9 previously marked as the City's Exhibit 1, and  
 10 do you recognize that as the City's proposal  
 11 that's before us here today?  
 12 **A. Yes. Yes.**  
 13 Q. I would ask that you flip with me to page 3-1 of  
 14 the City's proposal. And please let me know  
 15 when you're on that --  
 16 **A. I'm there, David.**  
 17 Q. Near the top of page 3 point -- or 3-1, there's  
 18 a third sentence, could you read for the record  
 19 where it starts, the operational shift, could  
 20 you start to read that sentence and I'll stop  
 21 you at a point?  
 22 **A. The operational shift to use more surface water**  
 23 **has resulted in the savings of over 400,000**  
 24 **acre-feet of groundwater since 1993.**  
 25 Q. Okay. I'd ask that you stop there and not

Page 1428

1 continue with the next sentence. Can you tell  
 2 me how this calculation of a savings of 400,000  
 3 acre-feet was derived, do you know?  
 4 **A. No. I mean, I don't know how Burns & McDonnell**  
 5 **or the City did it, but, I mean, you could look**  
 6 **at the water use records from the Equus Beds**  
 7 **well field to make that determination.**  
 8 Q. So in other words, you don't know if the City's  
 9 reduced groundwater usage helped restore the  
 10 water levels in the aquifer in the City's well  
 11 field, you haven't looked at data in that  
 12 regard?  
 13 **A. Well, I mean, the data's there. Yeah, the --**  
 14 **the data is all there, I mean, our whole team**  
 15 **would have looked at that.**  
 16 Q. It indicates in the proposal on the next page  
 17 that earlier -- at an earlier point in time, and  
 18 it doesn't -- it just says prior to the
