

Elk County

Floodplain Mapping Project Data Development Kickoff Meeting

April 11, 2024

FEMA

 AtkinsRéalis

While we are waiting, please enter your name and community in the chat box!

***Your engagement
in this process is
important to the
success of this
project, so thank
you for taking the
time to be here
today!***

**THANK
YOU**

Introductions

Kansas Department of Agriculture

Tara Lanzrath, CFM
NFIP Coordinator

**Joanna Rohlf, CFM,
GISP**
*Floodplain Mapping
Coordinator*

William Pace, CFM
*Floodplain Mapping
Specialist*

AtkinsRéalis

Mike Schlesener, GISP
Project Manager

**Cheyenne Sun Eagle,
CFM**
NFIP Specialist

Keegan Schultz
*Floodplain Outreach
Coordinator*

FEMA – Region VII

Dawn Livingston
Regional Project Officer

Brandon Gonzalez, PE
Engineer

Today's Goals

Share details on the mapping project

Get initial feedback on modeling methods

Review future steps

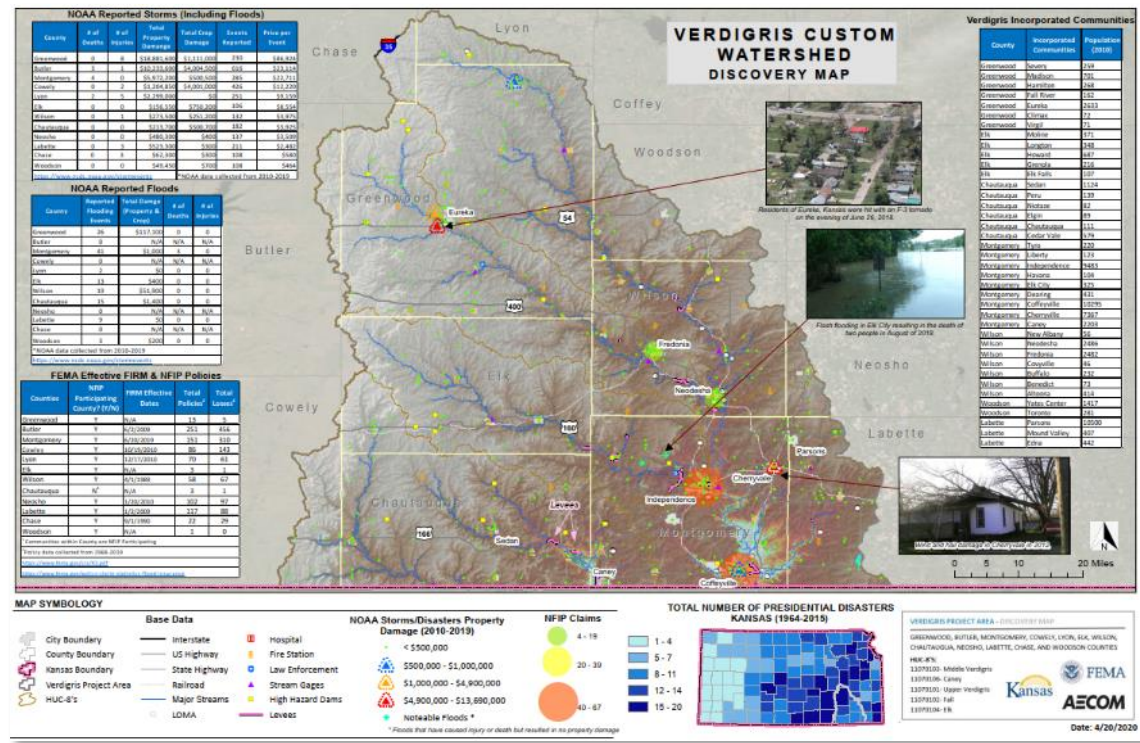

Background

Background

- Verdigris Custom Watershed Base Level Engineering Project
 - Kick-off Meeting: January 2020
 - Discovery Meetings and BLE Review: April - May 2020

The Verdigris River at Coffeyville, Kansas (courtesy from Public Domain)

Discovery Report

Verdigris Custom Watershed
 HUCs 11070103, 11070106, 11070101, 11070102, 11070104

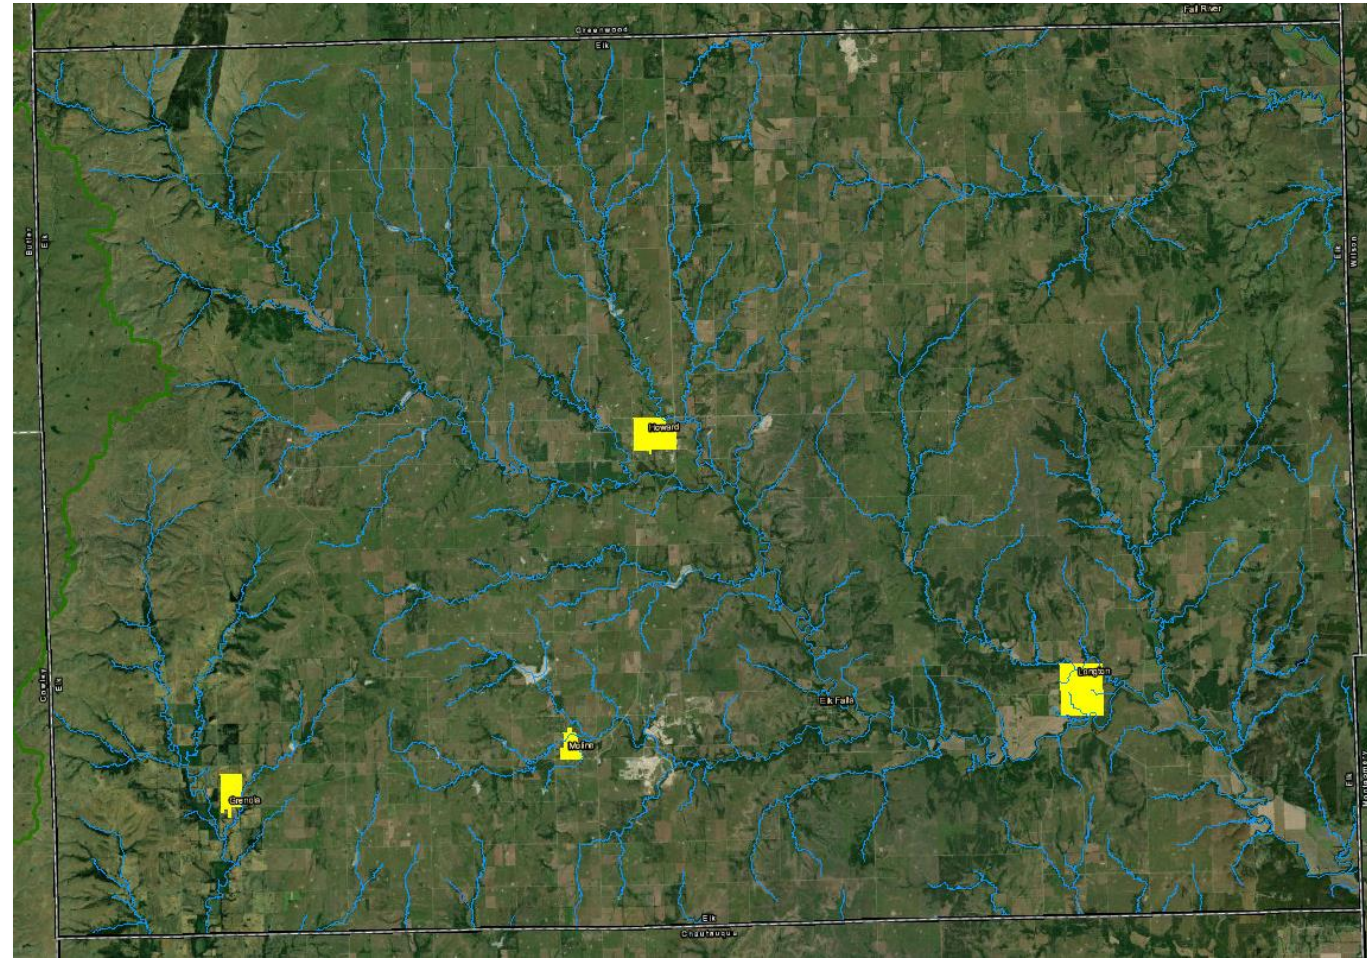

Counties: Chase, Butler, Cowley, Lyon, Greenwood, Elk, Chautauqua, Woodson, Wilson, Montgomery, Neosho, Labette

March 2020
 MIP Case Number: 19-07-00235

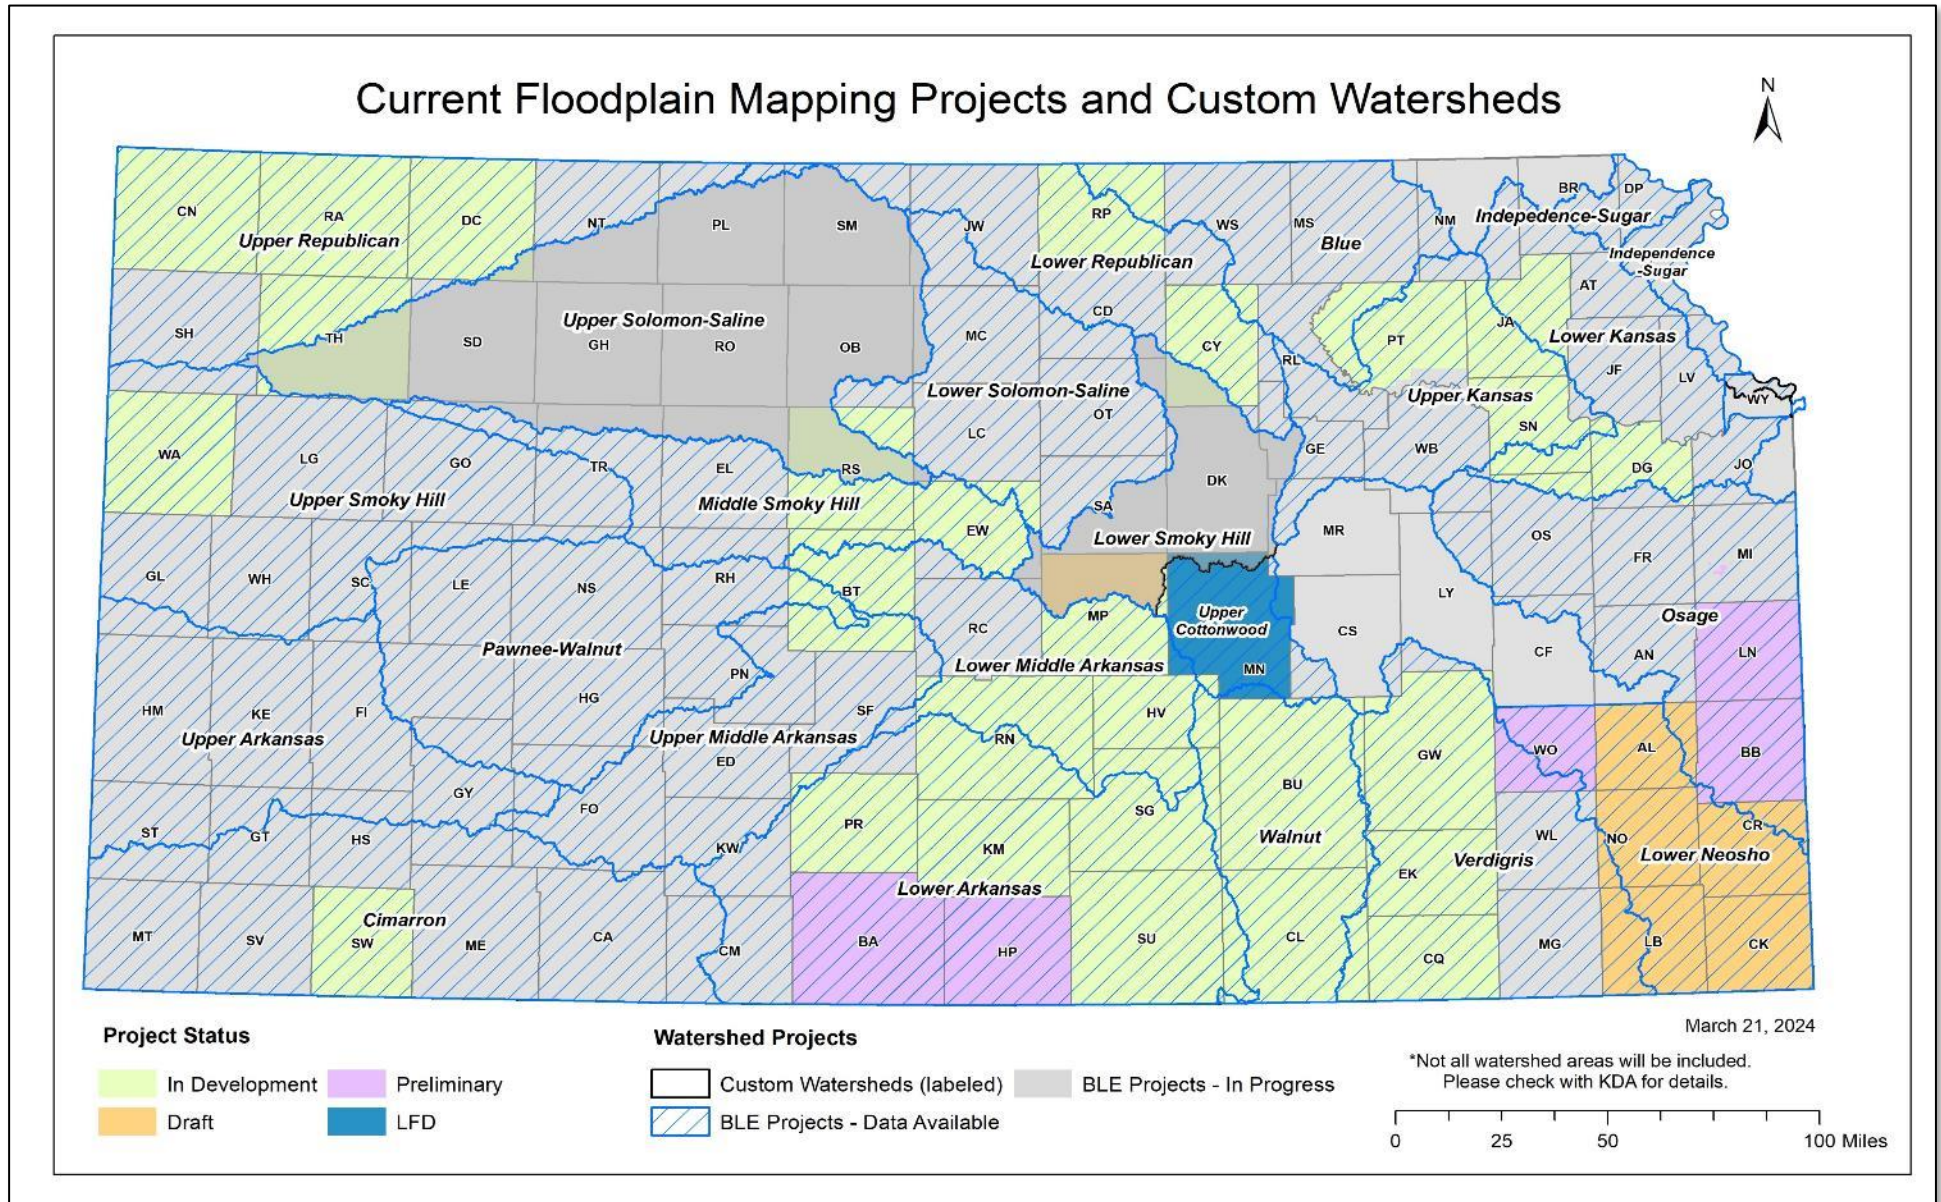

FEMA Kansas Division of Water Resources

Background

- First-time Countywide
 - Effective:
 - Grenola – 1975, 
 - Howard – 1977, 
 - Longton – 1990, 
 - Moline – 2008. 
- Data Development Kickoff Meeting was held virtually June 21, 2022.
 - Technical issues led to re-scoping and selecting AtkinsRéalis as contractor.
- Re-kick off meeting - April 2024

We are doing similar work across Kansas...

Review of the Work Ahead and How We Propose Doing It

Definitions

Hydrology
How Much Water?

Hydraulics
How High Will Water Get?

We Use 2D Hydraulic Modeling in our Base Level Engineering

The current maps are done with one-dimensional (1D) modeling. Two-dimensional (2D) modeling will be used for the new modeling.

1-D 2-D

Differences between traditional 1D studies and 'new' 2D studies

In a 2D model, elevations are in every cell eliminating interpolation

- 2D Studies evaluate flood risk beyond the channel banks
- More refined model in complex areas on a cell-by-cell basis

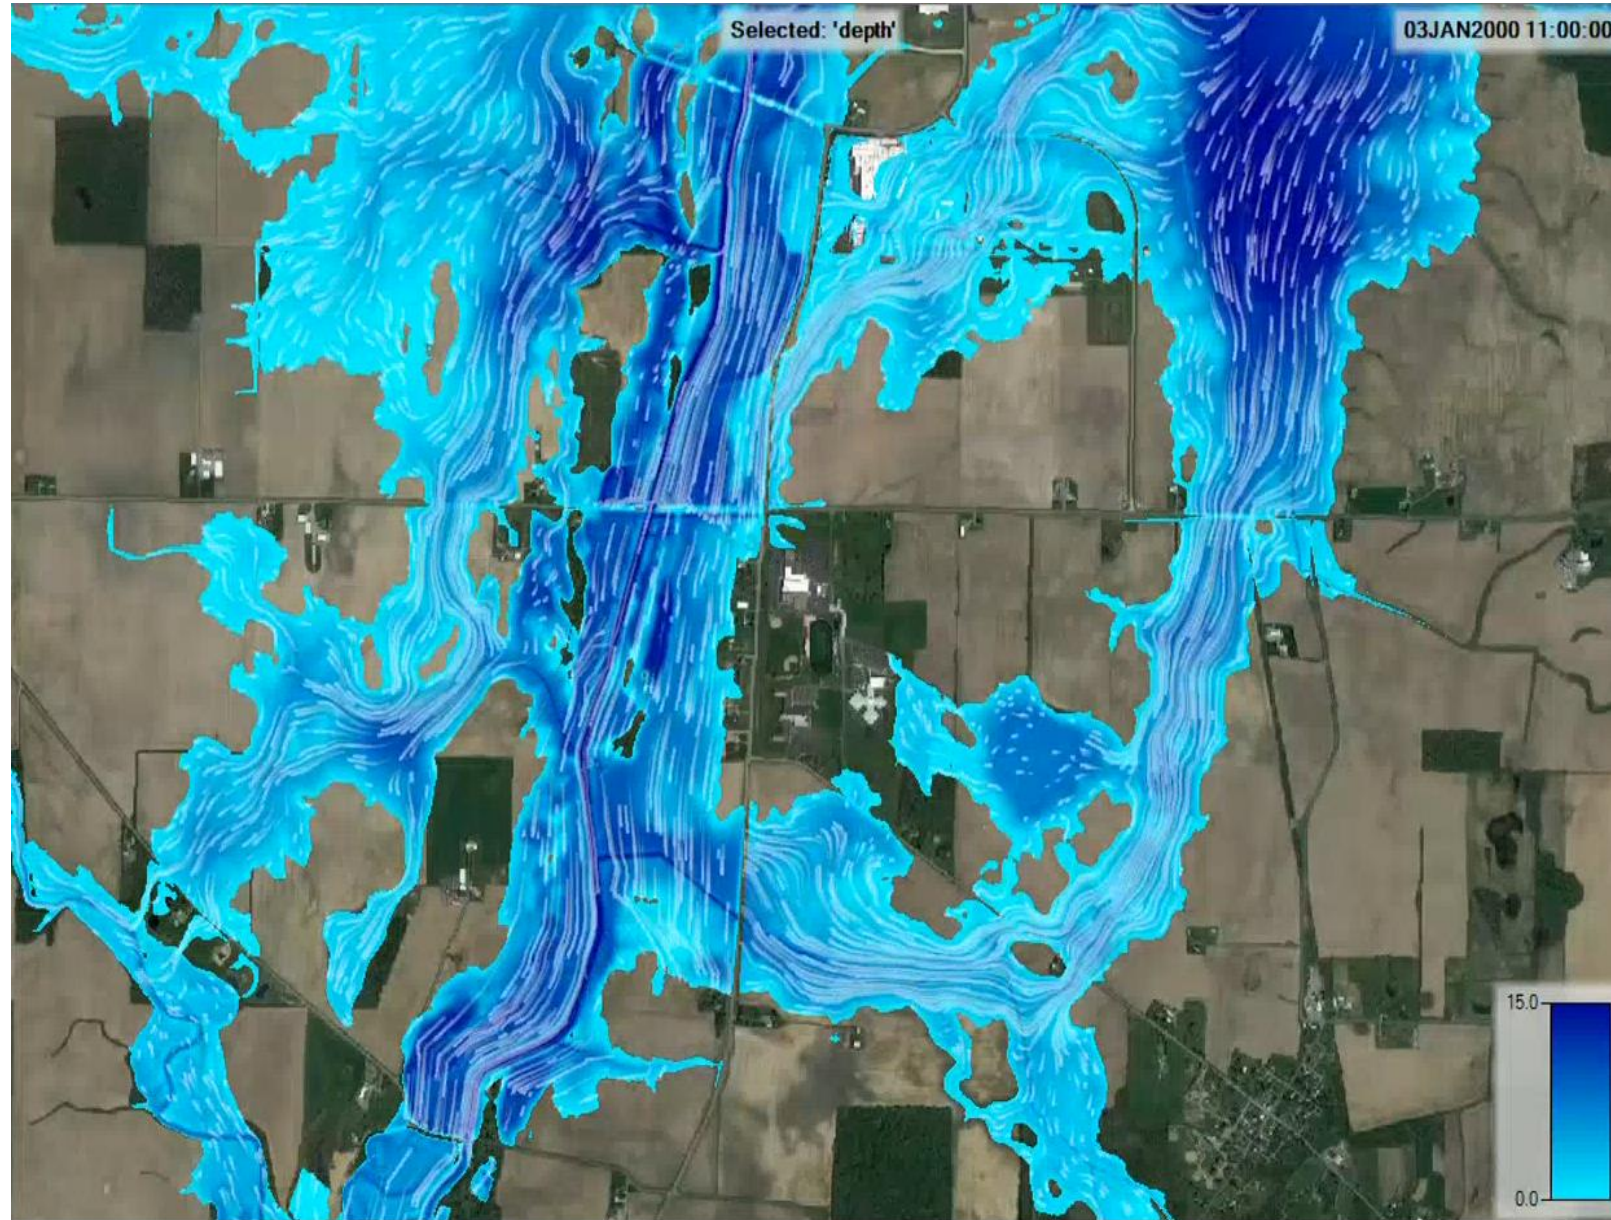

*More precise data
and modeling
methods gives
you more
information about
flood risk*

*More precise data
and modeling
methods gives
you more
information about
flood risk*

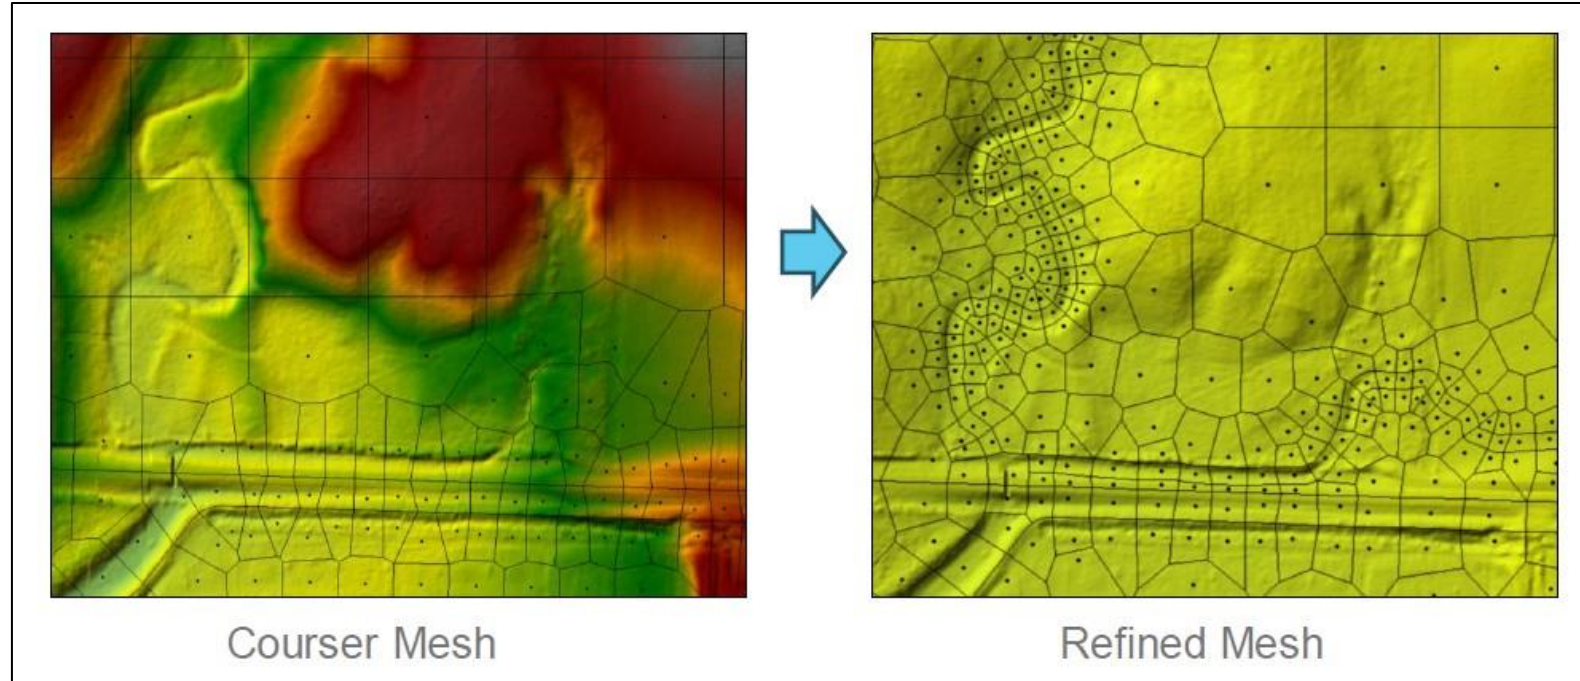

Model Enhancements

- Enhancements will be made to the BLE modeling that was performed.
 - Updated to newest version of HEC-RAS
 - Refined model meshes in cities with additional detail including:
 - Ground and channel Manning's roughness
 - Land use refinement
 - Re-verify gage analysis against refined results
 - Detailed structure modeling
 - Where data is available
 - Field collected structure data, if necessary

- Refined Mesh
 - Will allow for greater accuracy in flood modeling due to increased cell density

Model Enhancements

- Refined Land Use
 - Will allow for greater accuracy in surface modeling due to more detailed land use

Model Enhancements

Standard Landuse

Refined Landuse

- Gages will be re-verified in refined model

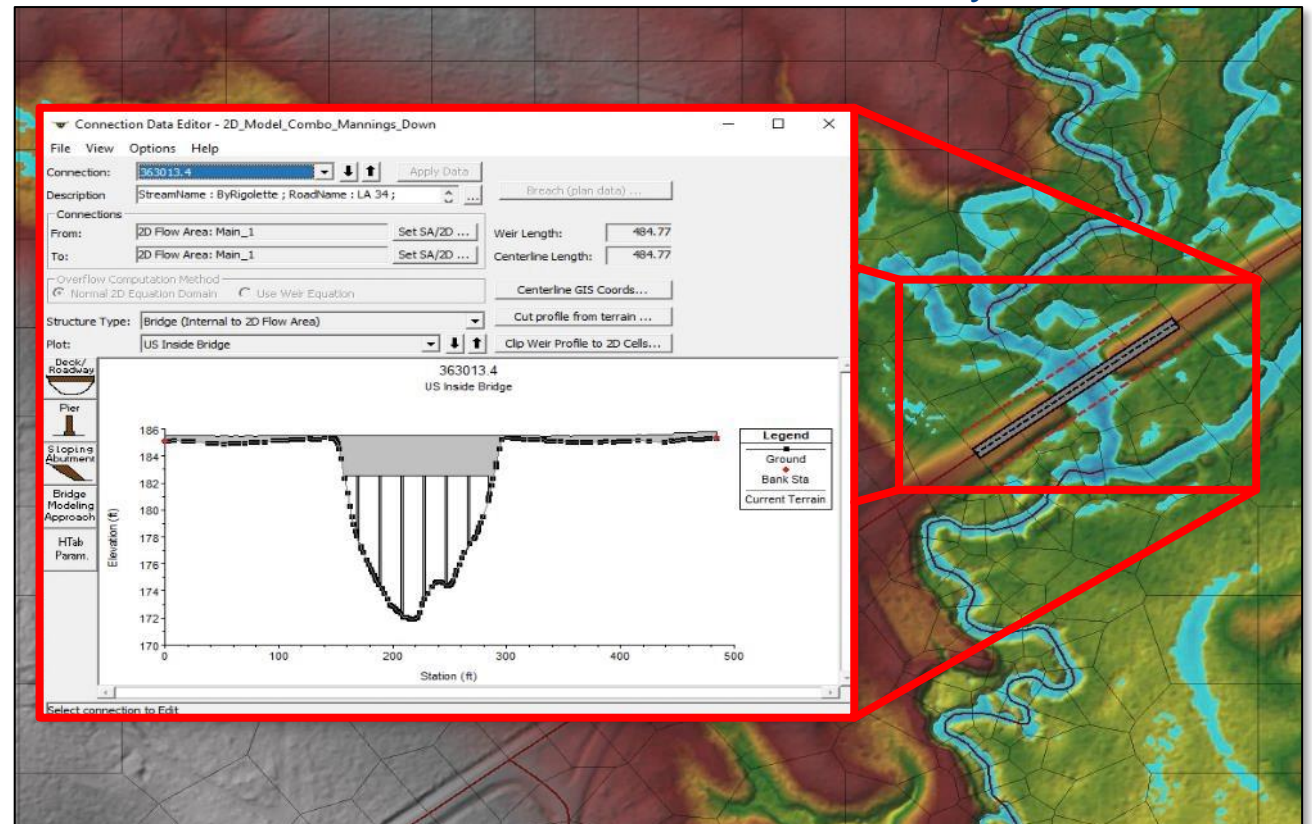

Model Enhancements

Model Enhancements

- Detailed structure modeling incorporated into Refined models, where data is available
- Do you have any recent structure improvements, or planned improvements, that has data that can be shared?
- Field collected structure data, if necessary

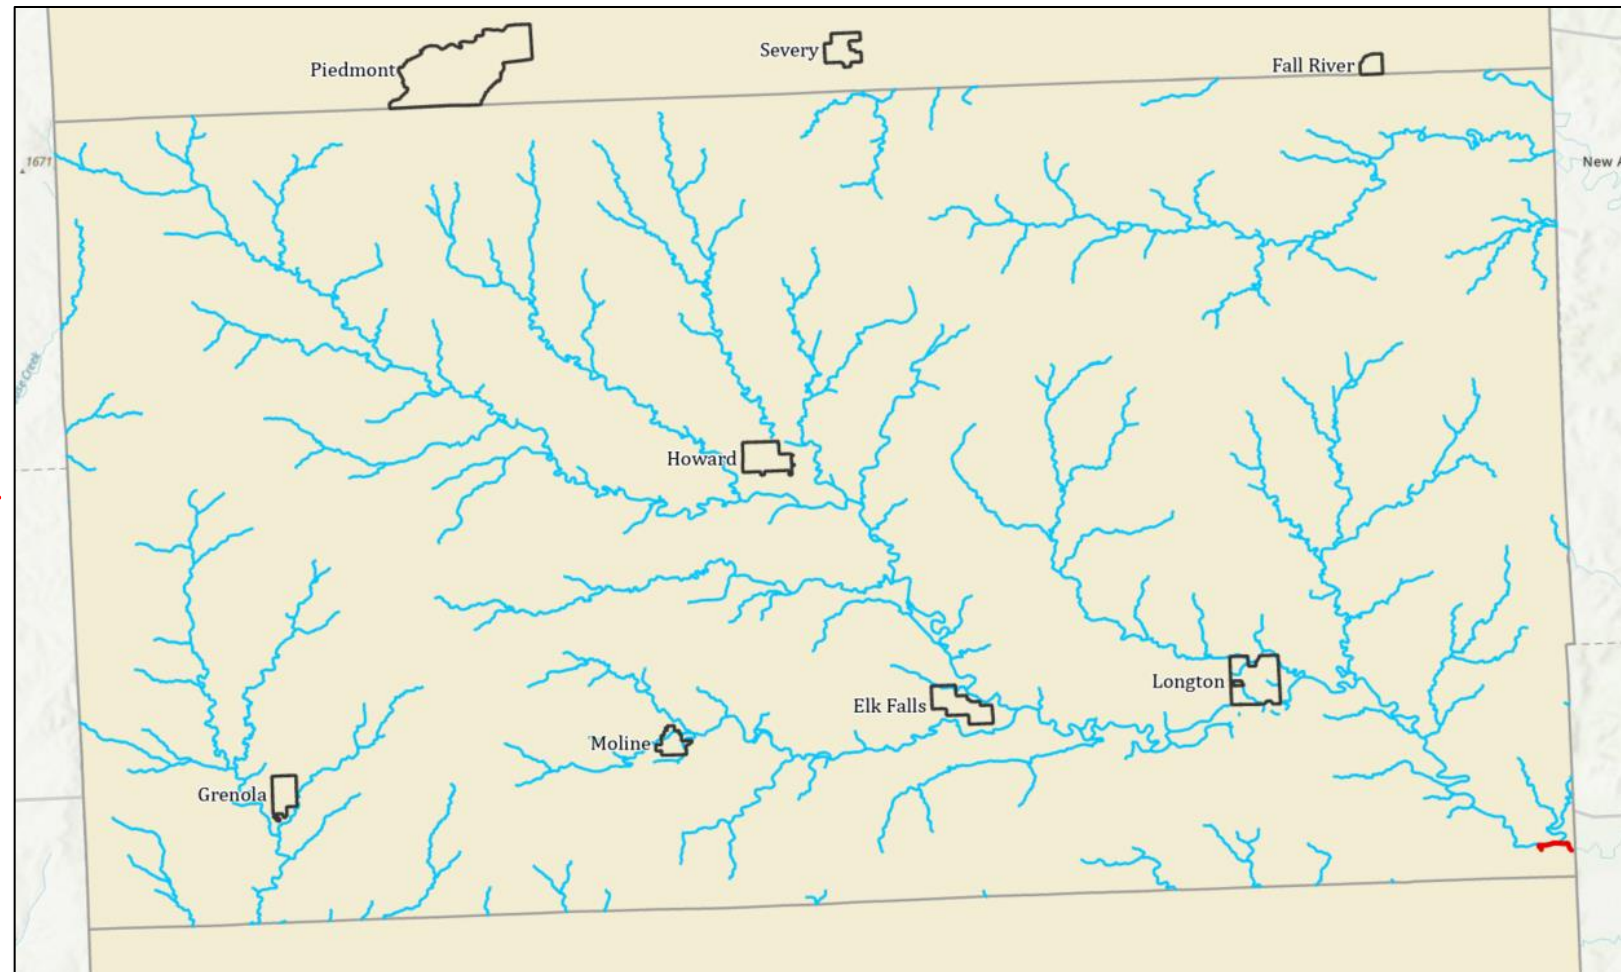

Model Enhancements

- Enhancements can be made to the BLE modeling that was performed.
 - New Lidar, flown in 2018, will be incorporated.
 - Comments made and additional information gathered during the Discovery and Data Development phase can be used to enhance the modeling.
 - With your feedback additional review/refinement of mesh can be done to improve accuracy of modeling.

Data Development Scope

Data Development Scope

- All Zone A 2D BLE (712 mi.)
- 26 FIRM Panels
- Non-Accredited levee (Elk River, SE corner of county)

Current Effectives:

- Grenola – 1975
- Howard – 1977
- Longton – 1990
- Moline – 2008

Levees

There is 1 non-accredited levee in the project area. The levee will be considered hydraulically insignificant.

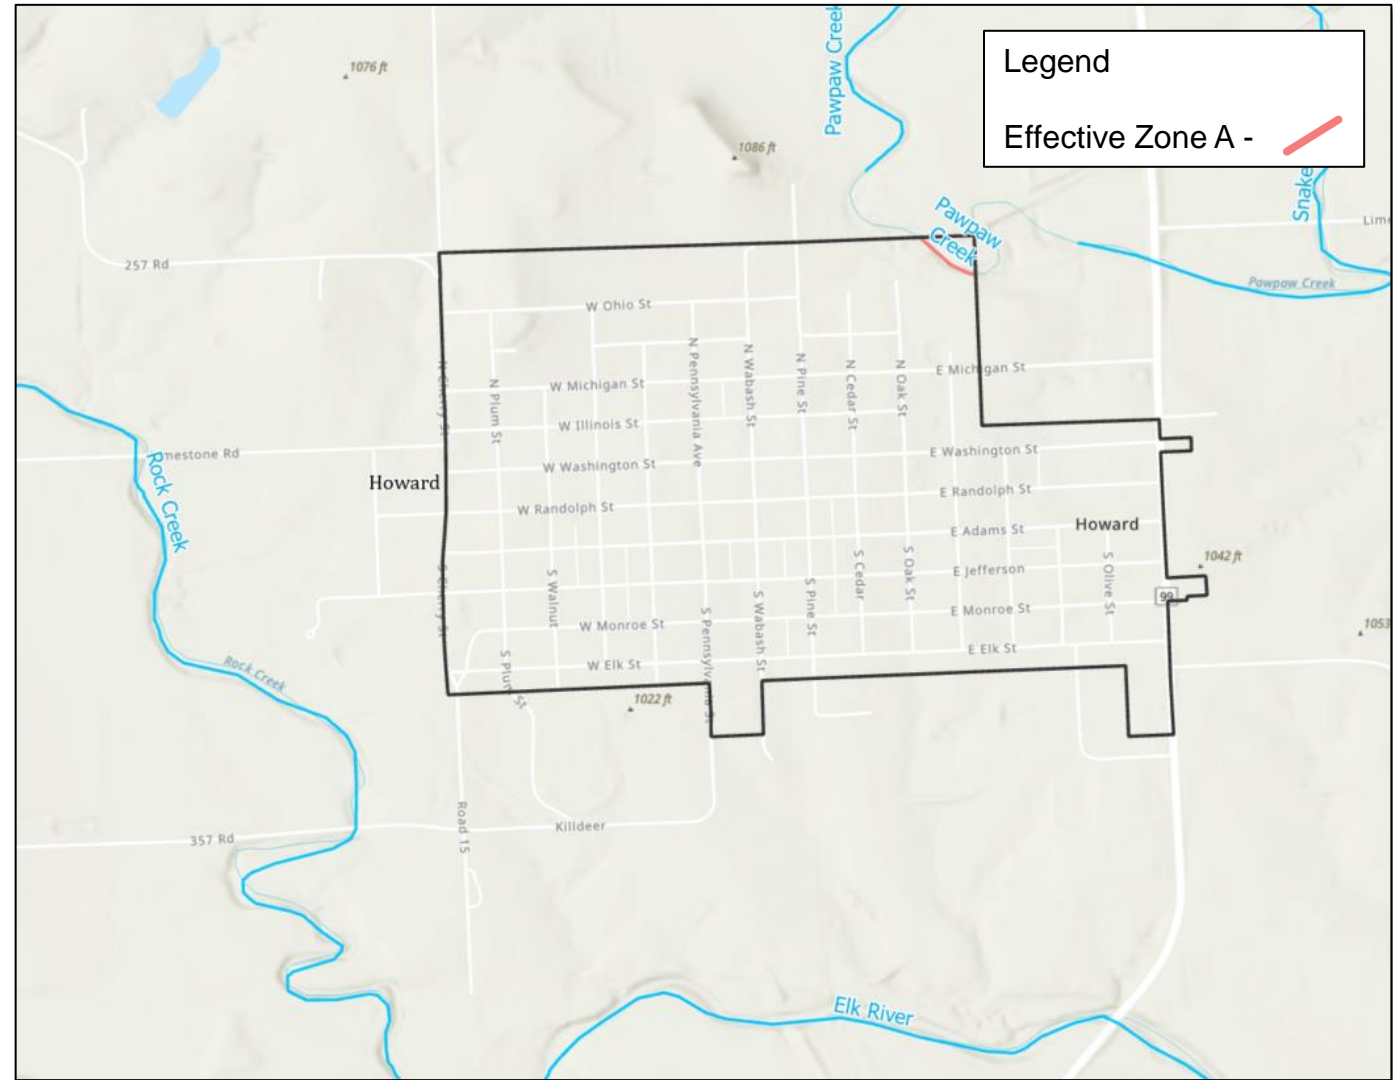

- Non-Accredited levee (Elk River, SE corner of county)

Data Development Scope

City of Howard

Effective Zone A – 0.10 miles

Data Development Scope

City of Grenola

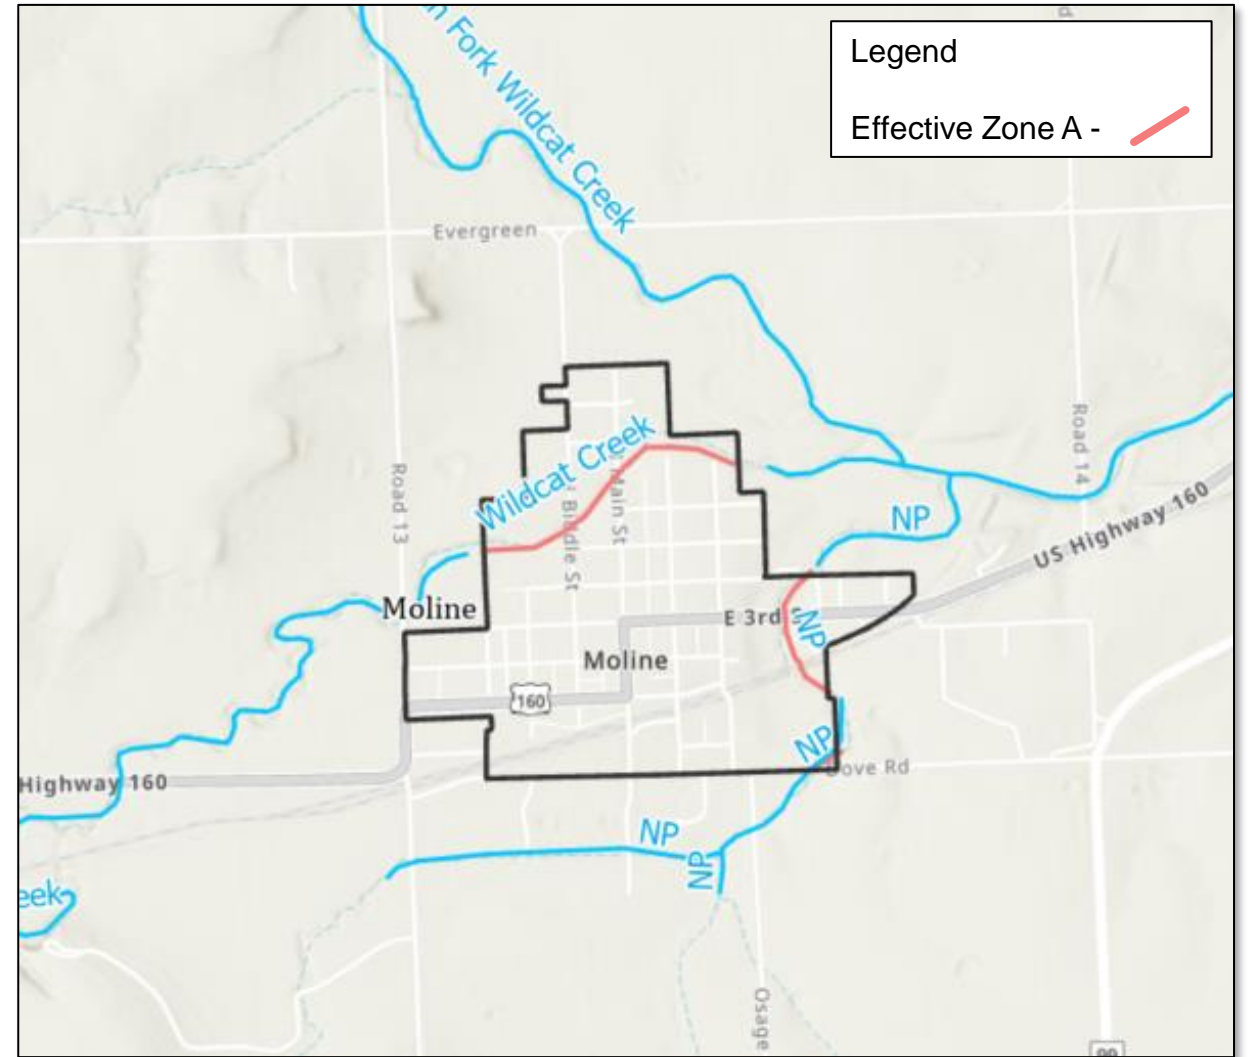

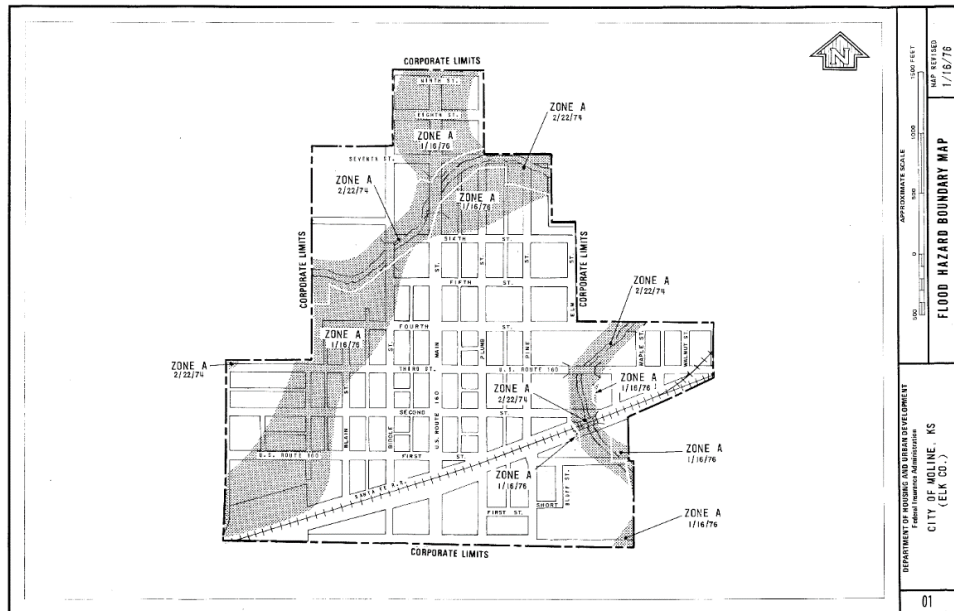

Effective Zone A – 0.09 miles

Data Development Scope

City of Moline

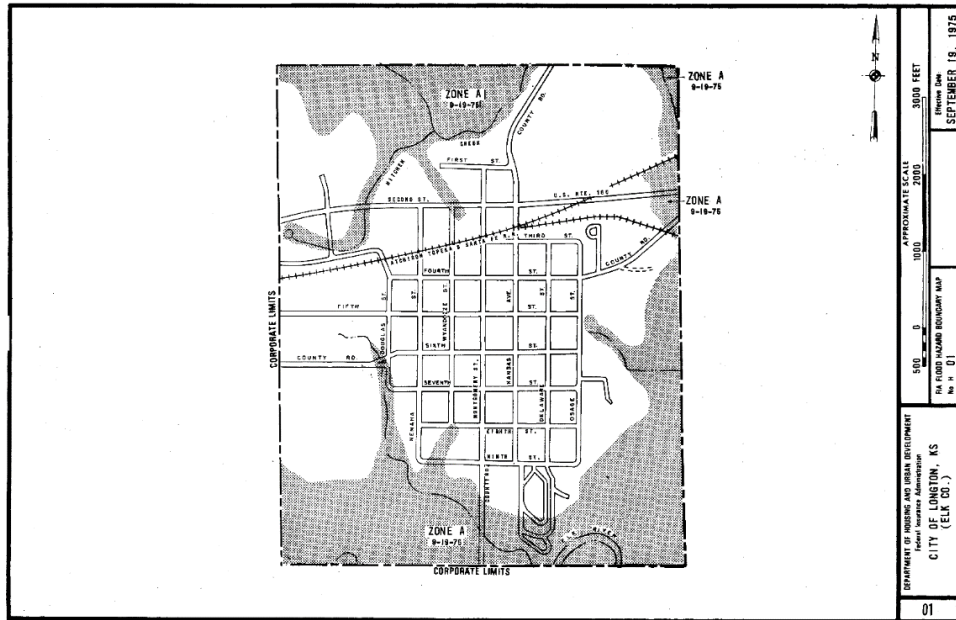

Effective Zone A – 0.72 miles

Data Development Scope

City of Longton

Effective Zone A – 2.50 miles

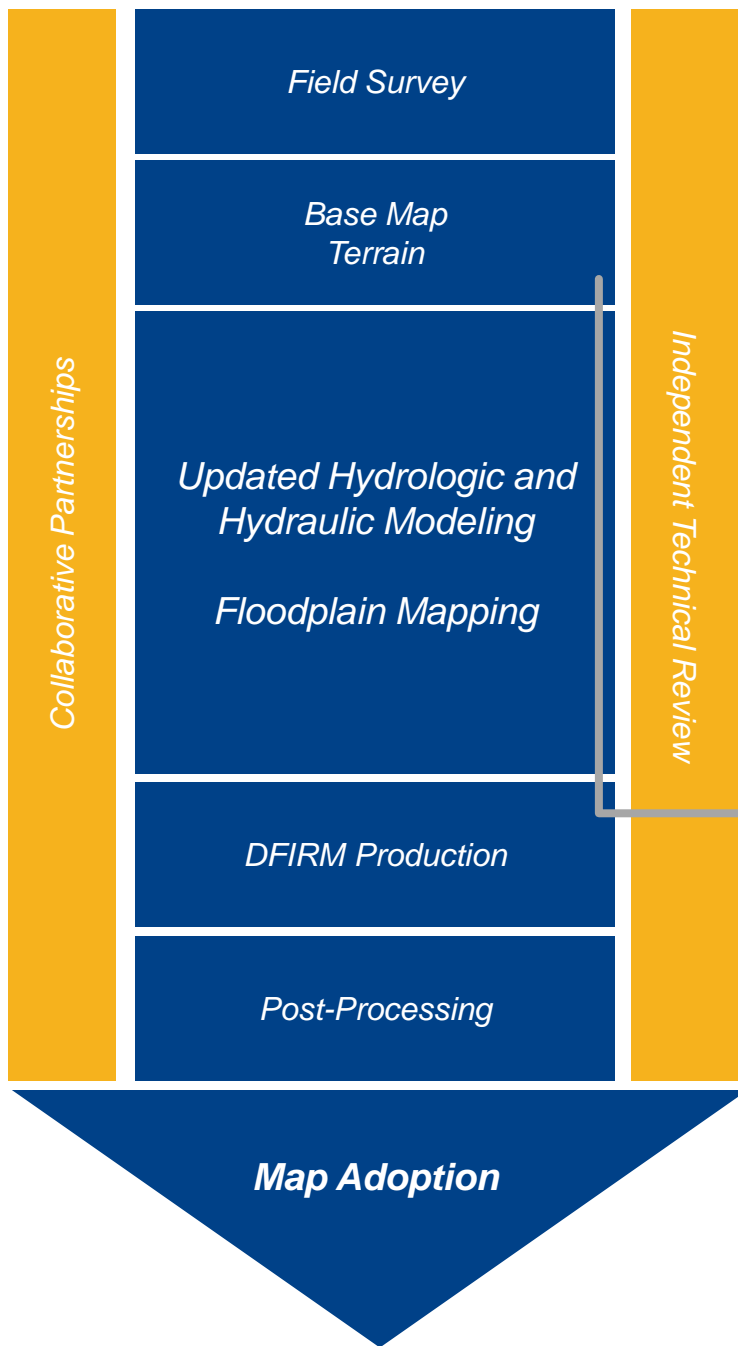

Data Development Scope

- Cities with Zone A
 - Elk Falls

Next Steps

Data Development

Project Tasks

1. Base Map and Topography Preparation
2. Hydrologic and Hydraulic Modeling
3. Floodplain Mapping
4. DFIRM and FIS Production
5. Post-Preliminary

We are about to begin the modeling task

Our Next Steps:

- We will complete the engineering analysis previously described.
- Several rounds of reviews will be completed.
- We will develop your draft regulatory floodplain maps.
 - Also known as your Flood Insurance Rate Map (FIRM)
- We will develop your draft Flood Insurance Study (FIS).
- We will have a community review period and a public review period

Our Next Steps:

- We will also be developing flood risk products for Elk County as part of this project.
 - Water Surface Elevation (WSE) Grids
 - Depth Grids
 - Percent Annual Chance & 30yr Chance Grids
 - Velocity Grids
 - Changes Since Last Firm (CSLF)

Flood Risk Products

Water Surface Elevation Grids

- Raster output from model that displays varying water surface elevations within derived floodplain extents
- Used to find base flood elevation throughout the floodplain rather than just at the extent lines.

Flood Depth Grids

- Raster output from model that displays varying depths of flooding within derived floodplain extents
- Used to find depth of flooding at any location, like residential structures, based on a subtraction of ground elevations from water surface elevation.

Flood Risk Products

- Percent Annual Chance Grids

- Raster output from model that displays varying likelihood, in percentage, of chance that any given cell within the raster has of flooding within a single year.

- Percent 30-yr Chance Grid

- Raster output from model that displays varying likelihood, in percentage, of chance that any given cell within the raster has of flooding within a 30 year period.

Flood Risk Products

- Velocity Grids
 - Raster output from model that displays varying velocities within the floodplain extents.
 - Can be used to help visualize areas within the floodplain with the highest velocities.

Project Timeline

**Kick-off Meeting and
Initial Community
Feedback:**
[TODAY!]

Data Development Work:
[Spring '24 – Spring '25]

- *Topographic Data*
- *Develop Hydrologic and Hydraulic Models*
- *Floodplain Mapping*

**Flood Risk Review
Meeting:**

- [~ Spring '25]
- *Your **review** and **feedback** on the draft maps*

Project Timeline, continued

Community
comments will
be **addressed**

Public review of
the draft maps

- *Includes Public
Open House*

**Preliminary Map
Products**

- *Preliminary DFIRM
Community
Coordination Meeting*

**Post-
Preliminary
Processing**

Key Takeaways

Floodplain Mapping Projects take time

Your involvement in this process will result in better flood information for your community

***DON'T HESITATE TO CALL,
WE ARE HERE TO HELP***

Resources

Online Project Information

Project Website

- Scoping Maps, Project Timeline, Meeting Presentations, Newsletters, Technical Reports, Web Review Map
