Welcome to the Food Protection Task Force quarterly newsletter! Meeting information, registration, and all quarterly newsletters can be found under Food Protection Task Force at agriculture.ks.gov/FPTF. If you would like to inquire about the Food Protection Task Force, join the steering committee, or have other questions, please contact us using our information on the back of this newsletter.

Food Safety

In the 4th quarter of 2019, the Kansas Department of Agriculture conducted 4,107 food establishment inspections and 93 food processing inspections.

Spotlight: Foodborne Illness Testimonials

The U.S. Centers for Disease Control and Prevention (CDC) estimates that 48 million people get sick, 128,000 people are hospitalized, and 3,000 people die from foodborne illnesses in the United States each year.

Retail and food service employees play an important role in protecting public health. The U.S. Food and Drug Administration (FDA) has developed foodborne illness testimonial videos which illustrate the devastating effects of foodborne illness. You can use these testimonial videos to educate your employees on the possible dire consequences of poor preparation practices and provide them with tips to prevent foodborne illness. For example, the testimonial videos could be used in breakrooms and training rooms to show what could happen when you don’t follow good food safety practices.

In November 2019, the FDA released two new testimonial videos. The first tells the story of Sarah Schacht, a young woman whose life was changed forever after lunch at a Seattle restaurant left her stricken with an E. coli infection six years ago. The second tells the story of Etti Gomez, who spent three weeks in a hospital and nearly died after eating dinner at an expensive restaurant. Her story is available in both English and Spanish, and includes a message from her personal physician about how to prevent foodborne illness. To view these testimonial videos and others, visit http://bit.ly/fbitestimonials.

The KDA has created handouts with more information about common foodborne illnesses. Visit agriculture.ks.gov/FSLeducation to view these handouts and learn more about preventing the following foodborne illnesses:

- Listeriosis
- Campylobacteriosis
- E. coli
- Hepatitis A
- Norovirus
- Salmonella
- Shigellosis

How To: Fix Top 5 Violations From 2019

1. TOXIC SUBSTANCES PROPERLY IDENTIFIED, STORED, AND USED
   All chemicals must be clearly labeled. Store chemicals and other poisonous substances so they cannot potentially spill or drop onto food, equipment, utensils, linens, and single-service or single-use articles. For more information, look at Handout #61: Chemical Storage.

2. PROPER DATE MARKING AND DISPOSITION
   Mark the food with the date by which it must be consumed or discarded. Allow seven days if held at 41°F or below. The day the food was prepared (or the day commercial processed food was opened) counts as day one. When food is removed from the freezer, mark it with a consume-by date that is seven days minus the length of time food was refrigerated before it was frozen. For more information, look at Handout #8: Date Marking.

3. FOOD-CONTACT SURFACES: CLEANED AND SANITIZED
   Food contact surfaces and utensils must be routinely washed, rinsed, and sanitized. Wash thoroughly in a hot detergent solution. Rinse by complete immersion in clean hot water. Sanitize by immersion for at least one minute in an approved chemical solution. For more information, look at Handout #36: Manual Cleaning and Sanitizing.

(Continued on back)
4. PROPER COLD HOLDING TEMPERATURES
When holding cold foods for service, protect all foods from possible contamination by covering them or using food shields. Use a food thermometer to measure the food’s internal temperature every 2 hours. Take corrective action whenever the temperature of a cold food item goes above 41°F. Discard potentially hazardous food held above 41°F for more than 4 hours. For more information, look at Handout #27: Hot and Cold Holding.

5. FOOD SEPARATED AND PROTECTED
If possible, designate separate sections of your walk-in cooler for raw and ready-to-eat products. This will minimize the chances of cross-contamination. Another option is to put all raw foods on the bottom shelves and all ready-to-eat foods on the top shelves. Refrigerated foods must be held at 41°F or lower. To hold them at this temperature in your walk-in cooler, you need to set the air temperature at 37°F. For more information, look at Handout #43: Storing Food in WIC.

Please contact KDA.FSL@ks.gov with any questions.

Feed Safety: Veterinary Feed Directive
A Veterinary Feed Directive (VFD) is a written (nonverbal) statement issued by a licensed veterinarian in the course of the veterinarian’s professional practice that authorizes the use of a VFD drug or combination VFD drug in or on an animal feed. A common question often asked about VFDs is the difference between an expiration date on the VFD and the duration of use. A VFD expiration date defines the period of time for which the authorization to feed an animal feed containing a VFD drug is lawful. The duration of use determines the length of time, established as part of the approval, conditional approval, or index listing process, that the animal feed containing the VFD drug is allowed to be fed to the animals. As a client it is important to know that a VFD or combination VFD feed must not be fed to animals after the expiration date on the VFD. If your VFD is set to expire before you are able to complete the duration of use, you will need to contact your veterinarian and request a new VFD order.

Please contact KDA.Feed@ks.gov with any questions.
