

2022

Components of the Lincoln County Annual Noxious Weed Management Plan

The Lincoln County Weed Department has determined that the primary noxious weeds found in Lincoln County include bindweed, musk thistle and Johnson grass.

The director of the weed department and any employees will survey areas for noxious weeds during the process of roadside spraying for broadleaf weeds. In addition, the director will make periodic forays throughout the county to determine where noxious weed problem areas exist.

Using all available resources, the weed department will do its best to eradicate all noxious weeds detected. The primary focus will be on suppressing the growth of noxious weeds in areas along right of ways adjacent to the agricultural production of small grains.

The county's noxious weed department annually sprays approximately 1,000 miles of right of-ways infested with bind weed.

In an effort to educate landowners, the director feels it is important to make personal contacts with individuals and/or groups to relate information concerning any new products introduced to help with the suppression of noxious weeds. He is available five days a week to answer any questions landowners may have concerning the management of noxious weeds and the chemicals used to control them.
