

Decatur County

FEMA

***Floodplain Mapping Project
Data Development Kickoff Meeting***

May 30, 2024

**While we are waiting, please enter your name
and community in the chat box!**

***Your engagement
in this process is
important to the
success of this
project, so thank
you for taking the
time to be here
today!***

**THANK
YOU**

Introductions

Kansas Department of Agriculture

**Joanna Rohlf, CFM,
GISP**

*Floodplain Mapping
Coordinator*

William Pace, CFM

*Floodplain Mapping
Specialist*

**Cheyenne Sun Eagle,
CFM**

NFIP Coordinator

Keegan Schwartz

*Floodplain Outreach
Specialist*

FEMA – Region VII

Dawn Livingston

Regional Project Officer

AtkinsRéalis

Mike Schlesener, GISP

Project Manager

Brandon Gonzalez, PE

Engineer

Today's Goals

Share details on the mapping project

Get initial feedback on modeling methods

Review future steps

Background

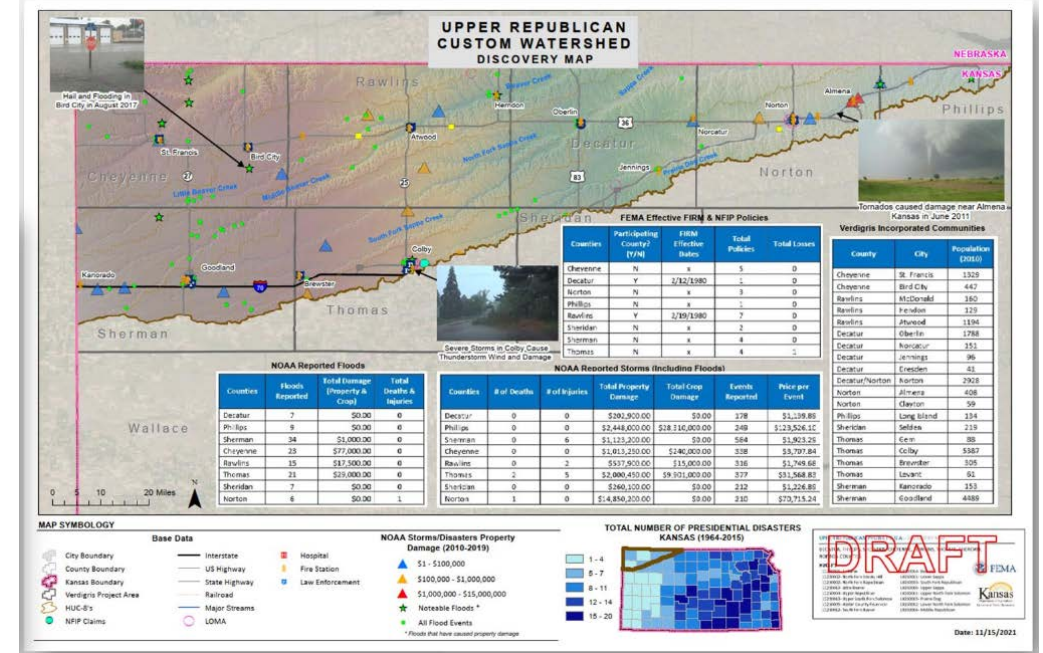

Background

- Upper Republican and Upper Solomon-Saline Custom Watershed Base Level Engineering Projects

- BLE Kick-off Meeting:*
 - Upper Republican – June 2021
 - Upper Solomon-Saline – June 2022
- Discovery Meetings and BLE Review:*
 - Upper Republican - April – August 2022
 - Upper Solomon-Saline - TBD

Discovery Report
 Upper Republican Custom Watershed
 HUCs 10250001, 10250002, 10250003, 10250004, 10250010, 10250011, 10250012, 10250013, 10250014, 10250015
 June 2022
 MIP Case Number: 20-07-00138

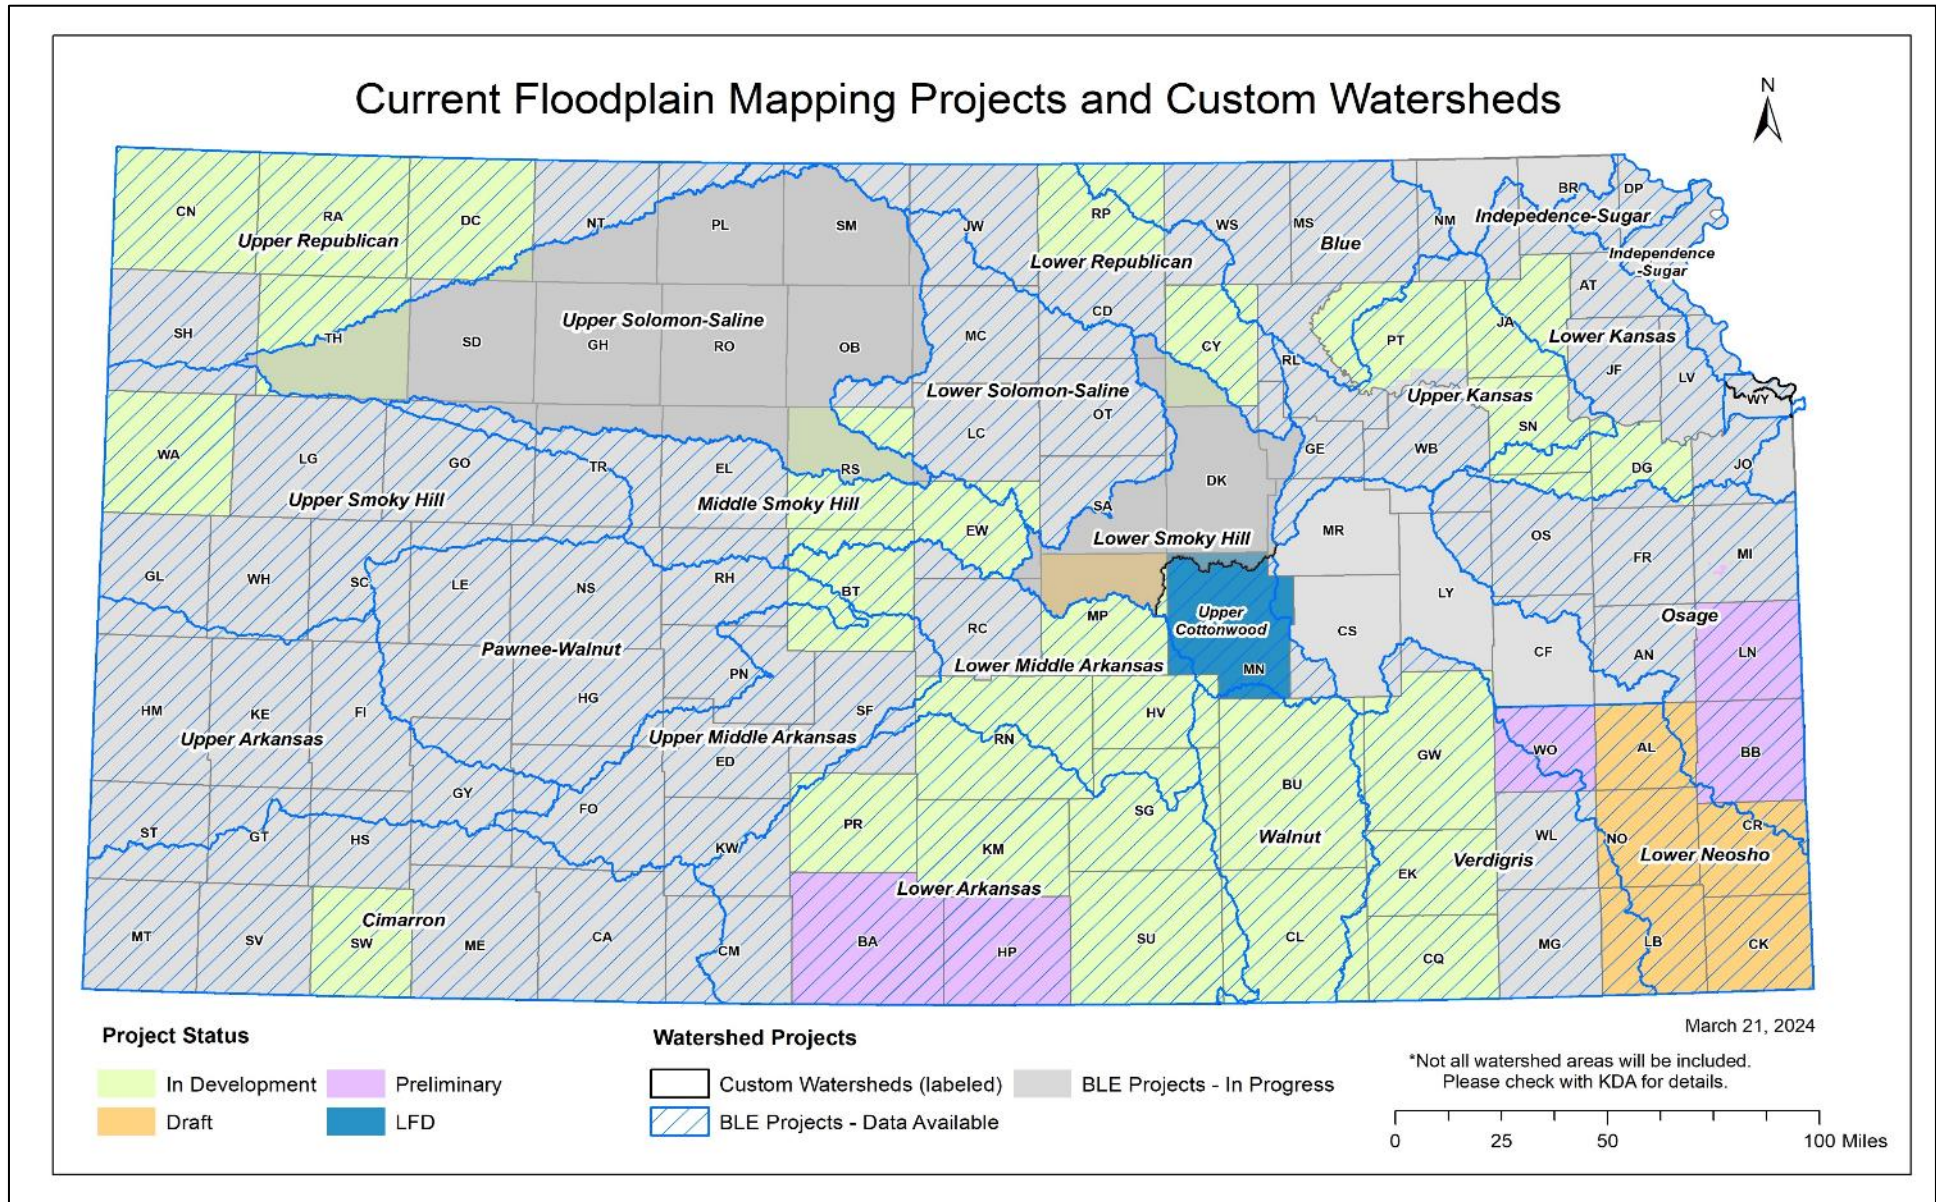

Background

- Decatur County-wide effective – 1980
 - Current County Effectives:
 - Oberlin – 1985
 - Clayton – 1980

We are doing similar work across Kansas...

Review of the Work Ahead and How We Propose Doing It

Definitions

Hydrology
How Much Water?

Hydraulics
How High Will Water Get?

We Use 2D Hydraulic Modeling in our Base Level Engineering

The current maps are done with one-dimensional (1D) modeling. Two-dimensional (2D) modeling will be used for the new modeling.

1-D 2-D

Differences between traditional 1D studies and 'new' 2D studies

In a 2D model, elevations are in every cell eliminating interpolation

- 2D Studies evaluate flood risk beyond the channel banks
- More refined model in complex areas on a cell-by-cell basis

*More precise data
and modeling
methods gives
you more
information about
flood risk*

***More precise data
and modeling
methods gives
you more
information about
flood risk***

Model Enhancements

- Enhancements will be made to the BLE modeling that was performed.
 - Updated to newest version of HEC-RAS
 - Refined model meshes in cities with additional detail including:
 - Ground and channel Manning's roughness
 - Land use refinement
 - Re-verify gage analysis against refined results
 - Detailed structure modeling
 - Where data is available
 - Field collected structure data, if necessary

Model Enhancements

- Refined Mesh
 - Will allow for greater accuracy in flood modeling due to increased cell density

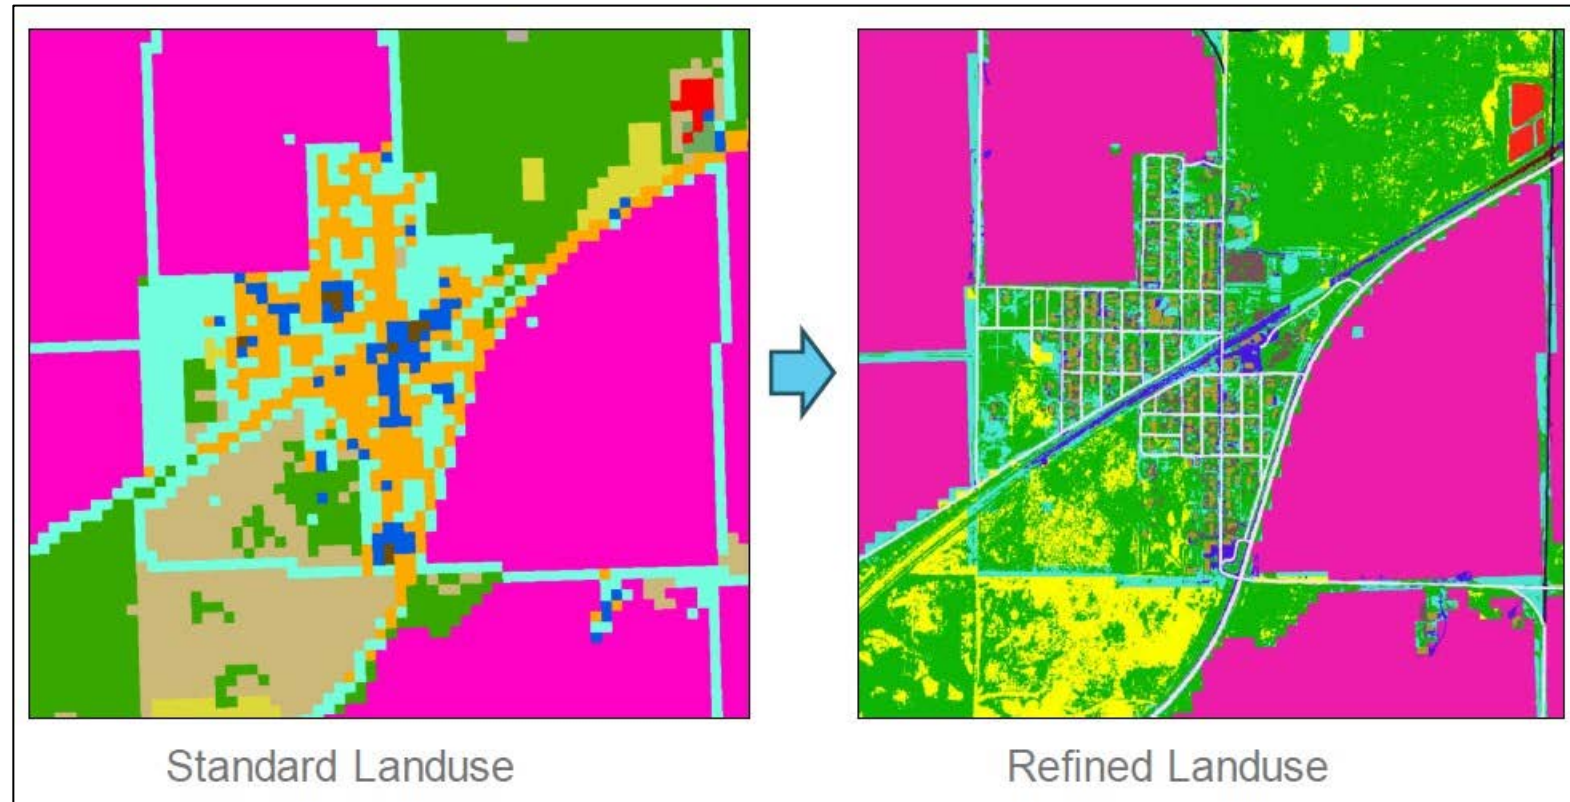

Coarser Mesh

Refined Mesh

Model Enhancements

- Refined Land Use
 - Will allow for greater accuracy in surface modeling due to more detailed land use

- Gages will be re-verified in refined model

Model Enhancements

Model Enhancements

- Detailed structure modeling incorporated into Refined models, where data is available
- Do you have any recent structure improvements, or planned improvements, that has data that can be shared?
- Field collected structure data, if necessary

Model Enhancements

- Enhancements can be made to the BLE modeling that was performed.
 - Lidar, flown in 2016, will be incorporated.
 - Comments made and additional information gathered during the Discovery and Data Development phase can be used to enhance the modeling.
 - With your feedback additional review/refinement of mesh can be done to improve accuracy of modeling.

Data Development Scope

Data Development Scope

- All Zone A 2D BLE (904 mi.)

Current Effectives:

- Decatur – 1980
- Oberlin – 1985
- Clayton – 1980

Levees

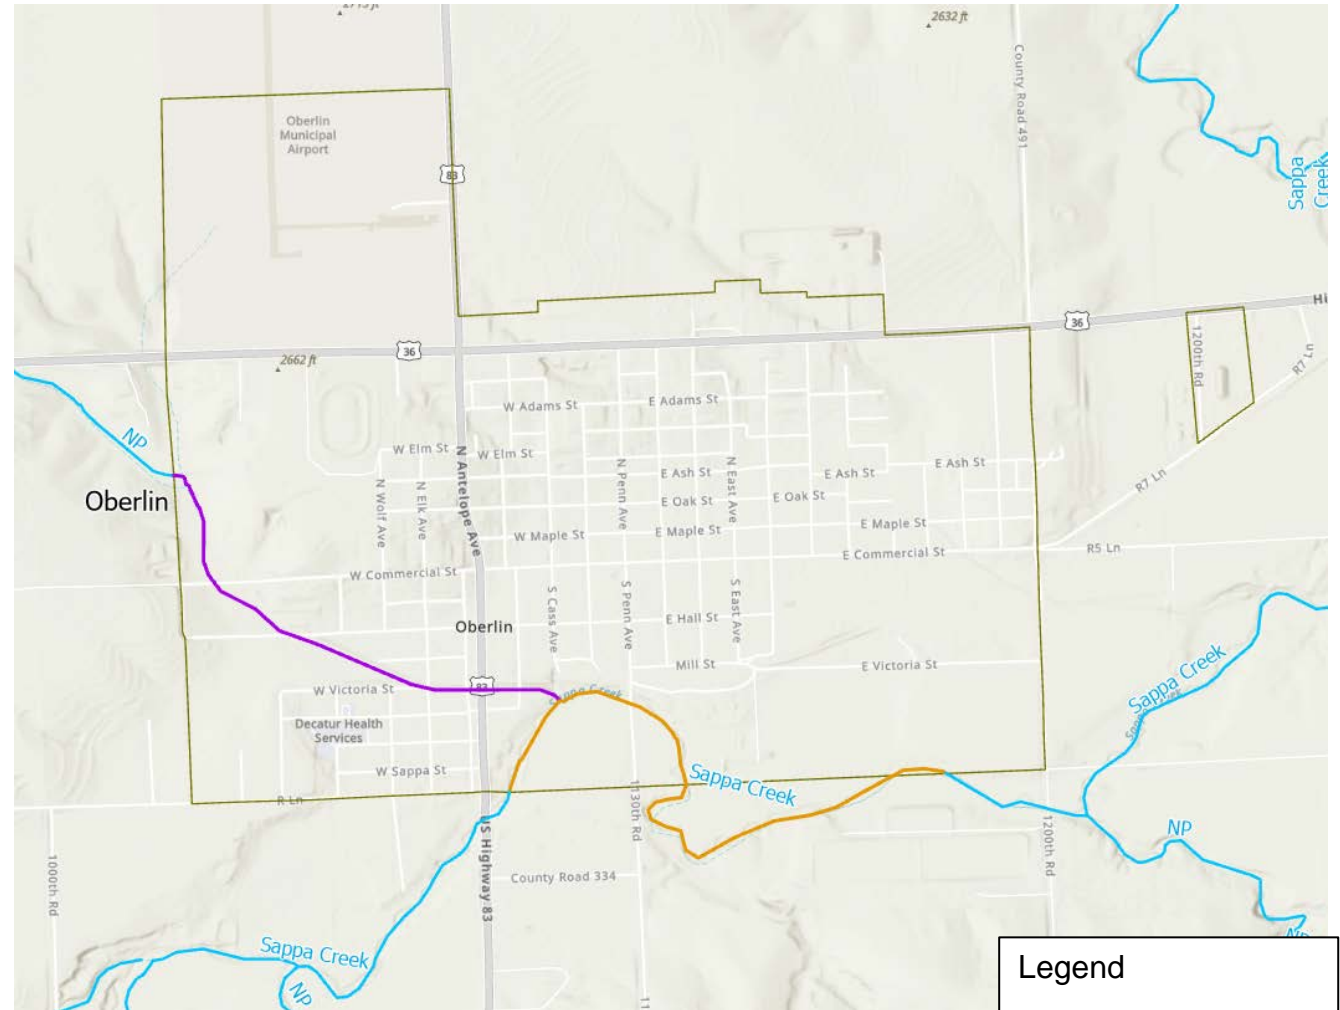

There are no non-accredited levees in the project area.

Data Development Scope

City of Oberlin

Zone A+ – 0.97 miles

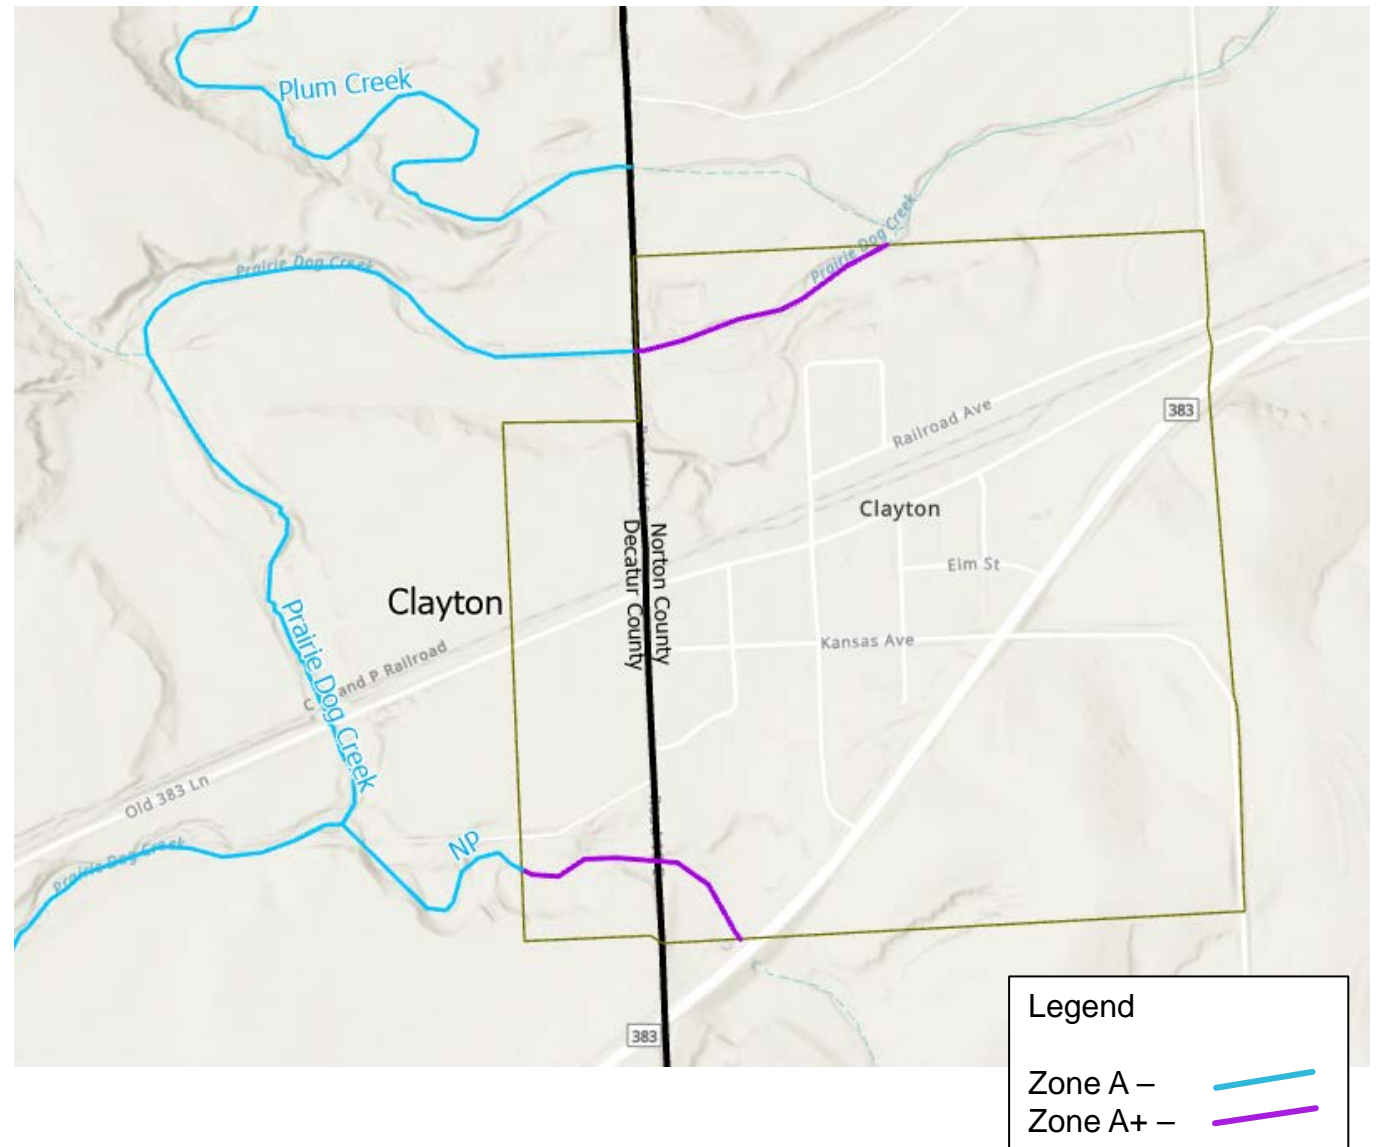

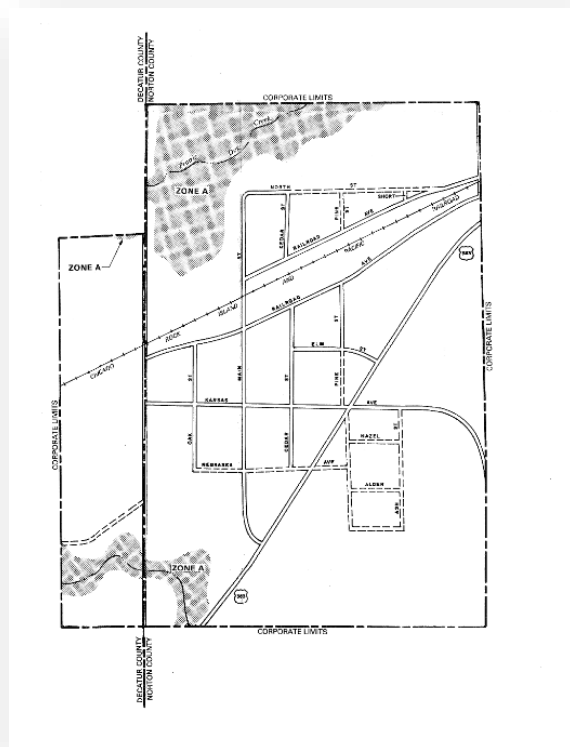

Zone AE – 1.33 miles

Legend	
Zone A –	
Zone A+ –	
Zone AE –	

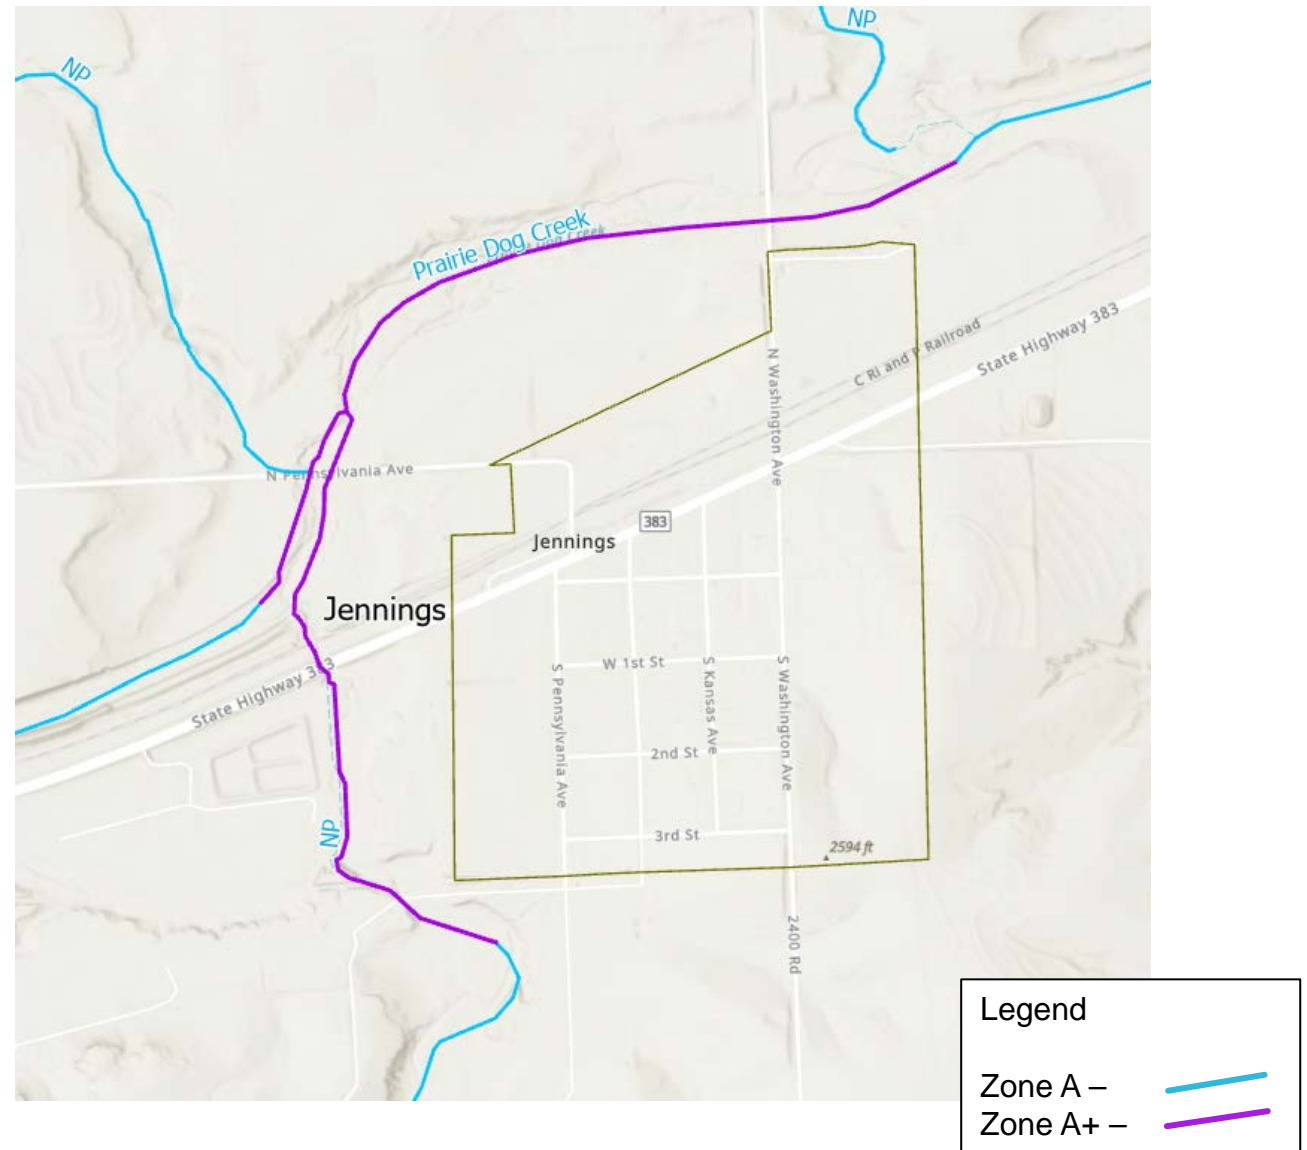

Data Development Scope

City of Clayton –
Zone A+ - 0.48 Miles

Data Development Scope

City of Jennings –
Zone A+ – 1.7 Miles

Data Development Scope

- Cities without Zone A+
 - Norcatur
 - Dresden

- Mapping determinations will be made for Zone A streams and playas using acceptable mapping criteria.
 - Mapped streams have defined bed and banks
 - Mapped playas have drainage areas of 1 sq. mile or greater
 - Mapped playas shows extended static ponding in model

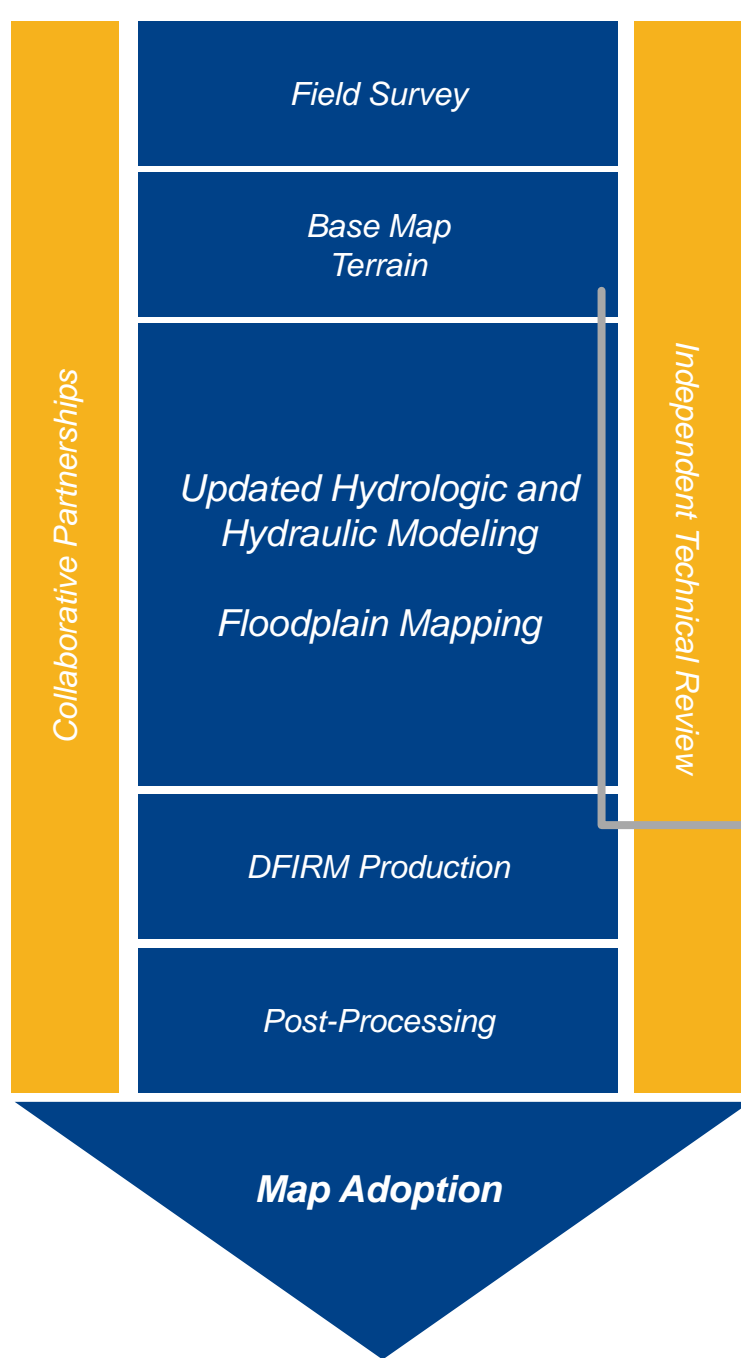

Draft Mapping

Next Steps

Data Development

Project Tasks

1. Base Map and Topography Preparation
2. Hydrologic and Hydraulic Modeling
3. Floodplain Mapping
4. DFIRM and FIS Production
5. Post-Preliminary

We are about to begin the modeling task

Our Next Steps:

- We will complete the engineering analysis previously described.
- Several rounds of reviews will be completed.
- We will develop your draft regulatory floodplain maps.
 - Also known as your Flood Insurance Rate Map (FIRM)
- We will develop your draft Flood Insurance Study (FIS).
- We will have a community review period and a public review period

- We will also be developing flood risk products for Decatur County as part of this project.
 - Water Surface Elevation (WSE) Grids
 - Depth Grids
 - Percent Annual Chance & 30yr Chance Grids
 - Velocity Grids

Our Next Steps:

Flood Risk Products

Water Surface Elevation Grids

- Raster output from model that displays varying water surface elevations within derived floodplain extents
- Used to find base flood elevation throughout the floodplain rather than just at the extent lines.

Flood Depth Grids

- Raster output from model that displays varying depths of flooding within derived floodplain extents
- Used to find depth of flooding at any location, like residential structures, based on a subtraction of ground elevations from water surface elevation.

Flood Risk Products

- Percent Annual Chance Grids

- Raster output from model that displays varying likelihood, in percentage, of chance that any given cell within the raster has of flooding within a single year.

- Percent 30-yr Chance Grid

- Raster output from model that displays varying likelihood, in percentage, of chance that any given cell within the raster has of flooding within a 30 year period.

Flood Risk Products

- Velocity Grids
 - Raster output from model that displays varying velocities within the floodplain extents.
 - Can be used to help visualize areas within the floodplain with the highest velocities.

Project Timeline

Project Timeline, continued

Community
comments will
be **addressed**

Public review of
the draft maps

- *Includes Public
Open House*

**Preliminary Map
Products**

- *Preliminary DFIRM
Community
Coordination Meeting*

**Post-
Preliminary
Processing**

Key Takeaways

Floodplain Mapping Projects take time

Your involvement in this process will result in better flood information for your community
